50 EGYPTIAN TOWNS SURVEYED ON AN AVIAN

From the Mediterranean seaboard to Assuan on Egypt's Southern frontier, the Air Survey Company have recently made extensive large scale surveys from the air.

One machine only was used for the survey. Its total flying time was 140 hours. It flew a total of 10,500 miles. It surveyed 50 towns, 1,400 "vertical" photographs were taken. Yet, despite adverse flying conditions at Heliopolis and heavy loads on many flights, the two months' survey was carried through without a single hitch.

The aeroplane used throughout was an Avro Avian.

AVRO AVIAN

The safest, most dependable and easiest to handle light aeroplane. Used increasingly by flying clubs throughout the world.

ON THE SCHNEIDER COURSE.

Regular readers of this paper are probably aware by now that there are certain objections to the course over which the Racing Committee of the Royal Aero Club have chosen that the contest for the Schneider Trophy shall be flown. Briefly the chief objection is that the only long stretch of shore line from which the flying can conveniently be seen is the North East Coast of the Isle of Wight between Cowes and Seaview, and there seems no good reason why the millions of taxpayers who want to see the contest should be compelled to go to all the inconvenience and expense and waste of time of going to and fro an island which exists chiefly to keep the English Channel out of the Solent,—except when it provides luxurious leisure to a lot of idle people, who do not mind being the prey to rapacious hotel-keepers and pension-proprietors.

To make the whole business clear there is published herewith a map, drawn by Raynoil Ltd., of the whole Solent area. On it the course officially chosen by the Royal Aero Club is shown in full black lines. With it is shown in broken lines an alternative course of exactly the same length, which one suggests would be very much more desirable. And above that, in a dot-and-dash line is shown the Northern leg of another alternative course.

As may be seen, the Aero Club course approaches the mainland off Southsea, where there is a turning-point, and cuts over the land South of Gosport at Gilkicker Fort. And that is all the people on the mainland see of the flying, for the course then goes right away from the land into the middle of the Solent where, at the next turning point, the machines will be so far away as to be practically invisible from any of the three shore-lines.

From that point the course comes along the coast of the Isle of Wight, past Ryde, off which the Orient *S.S. Orford* will be anchored, and where the Club has placed the starting and finishing point, turns round a mark-boat off Seaview and goes out to sea to a mark-boat out in the Channel. After which there is the turn off Southsea again.

The Invisible Contest.

Thus all may see that the two sharp turning-points which always provide the most spectacular flying are so placed that the turns can only be seen by the privileged few who can afford to go in yachts, motor-boats or excursion steamers.

The best views from the land will be had, as already said, by the comparatively well-to-do or idle people who can afford the time and money to go and stay on the Isle of Wight. In this connection one hears already of gross profiteering by hotels and lodging-houses. They say that quite small houses in the vicinity of Ryde are being let for 100 guineas for the Schneider Week.

On the English side of the Solent the only points from which anything will be seen are Southsea Common and Pier, and Stokes Bay just to the West of Gilkicker Fort. From the mouth of Portsmouth Harbour to the open part of Southsea the shore-line consists of yards which have to do with shipping, or Admiralty premises of some sort, where there is practically no accommodation for the general public. So that hundreds of thousands of people will be herded together along the common, or parade, or whatever they call it, and on the pier at Southsea.

There is only one road into Portsmouth from the rest of England, and that road is going to be one solid jam of traffic. The publicans and profiteers of Southsea and Portsmouth may profit by the embarrassment of the public, but Aviation certainly will not.

On the other side, from Portsmouth Harbour to Gil-

THE SOLUTION OF THE SOLENT PROBLEM.—The Schneider Course as chosen, and (in dotted lines) as it should be, to give the taxpayer a run for his money.

Digitized by Google

kicker, by the grounds of Haslar Hospital and by the Fort, there will be very little room for spectators.

Stokes Bay certainly will accommodate a good many thousands of people, but the roads to it are narrow and the car-jam will be awful. In fact, as has been said in this paper before, every thing possible seems to have been done to create difficult circumstances for the British public who are paying for the competition.

In addition the course chosen has four corners and so the difficulties for the pilots are increased.

A Preferable Course.

Now consider the three-cornered course as indicated by the dotted lines. In the first place it passes quite close to the long stretch of land between Gosport and Southampton Water,—which has both cliffs and a beach from which the flying could be watched.

There are plenty of roads leading to the shore so that there would be very much less congestion of motor-cars.

This stretch of coast can be reached easily from Southampton, Winchester and all the other towns in Hampshire, as well as from places to the east as far as Chichester and even Brighton,—so there would be plenty of accommodation to be had.

Furthermore, by making Calshot Castle the turning-point a first-class view of the turn can be given to tens of thousands of people along the shore of the mouth of Southampton Water and of the Solent to the West of Calshot.

The strip of shingle which connects the Calshot Air Station with the New Forest would alone accommodate at least as many people as could be got onto the promenade at Southsea.

This arrangement would have the further advantage of relieving the congestion on the roads between Southampton and Portsmouth by attracting a vast number of people to the New Forest side of Southampton Water, and those coming from a distance in the West Country would find good accommodation at Lyndhurst, Lymington, Beaulieu and even so far away as Bournemouth.

Seemingly one of the reasons for the course which has been chosen is that Portsmouth and Southsea (either the Municipalities or the Chambers of Commerce or some bodies of that sort) have promised to contribute handsome sums to the Royal Aero Club towards paying the expenses of the Contest. Probably they have been astute enough to reckon that as the people cannot stand along the seashore for multitude there will be room for them in the inns,—and a resultant profit.

This admittedly is a sound reason from the Aero Club's point of view. But one submits that it is not good enough to justify depriving many hundreds of thousands, and possibly millions, of people of a reasonable view of the flying. Surely there are *some* men with money in this country besides Sir Charles Wakefield. And surely some of them are, or can be, interested in the progress of British Aviation enough to put up sums which will cover the expenses of the Contest.

The Third Alternative.

If Southsea *must* be given a better view of the flying than is afforded by the dotted line, then the Eastern turning-point might be moved further to the North—approximately to the point marked "A," so as to bring the line between it and Calshot nearer to Southsea. This would then bring the course over the land, perhaps a mile or two inland, somewhere behind Fort Gosport, and it would come out over the water again just about at Lee-on-Solent.

There is in fact no particular objection to this. If an engine happened to cut out while the machine was flying over land, the machine would cover the distance to the water in not more than 12 seconds. And if something broke in the machine itself and put it out of control the result would be precisely the same whether it happened to be over land or water.

As a matter of fact, if a machine got out of control on the course at present chosen while flying from the Eastern turning-point towards Southsea, the chances are that it would crash bang in the middle of Portsmouth or Gosport.

Those who were at Venice will remember what happened when something went wrong with Captain Guazetti's engine when he was turning over the Mole. He was blinded by oil or steam just as he came round the turning-point and instead of following the course he shot straight across the Lido, missed the top of the Excelsior Hotel by only a few feet, and somehow got down into the Lagoon behind. A similar happening at the Southsea turning-point would put the pilot into the land somewhere beyond Portsmouth Harbour.

Actually, with aircraft flying at such appalling speeds as will be made in the Schneider Trophy Contest this year, a pilot is just as safe a couple of miles inland as he is over the water itself. If something goes wrong while he is over land he has a good chance of reaching the water. And if it happens while he is flying over the water he is just as likely to crash into the land.

Therefore there is no particular objection to moving the Eastern turning-point to approximately such a point as that marked "A," and bringing the course close to Southsea and actually over the Gosport area.

For the Benefit of the Press.

This alteration in the course, besides giving a chance of seeing the flying properly to some millions of people who cannot afford either the time or the money to go to the Isle of Wight, and are afraid of the necessarily appalling congestion at Gosport and Southsea, would also be a great convenience to all those whose duty calls them to watch the contest.

The good ship *Orford* could still be used as Headquarters, but instead of being anchored on the inaccessible Isle of Wight side of the Solent, she could be anchored either off Southsea or somewhere to the West of Lee-on-Solent.

From either place, whatever may be the congestion on the roads, access and egress would be easier than from anywhere on the Isle of Wight.

Also, from the press point of view there would be the ad-

FOR THE KING'S CUP.—The Vickers 141 single-seat biplane (Rolls-Royce "F" type engine) which will be flown in the race for the King's Cup by Flg. Off. Summers, the new test pilot for Vickers (Aviation) Ltd.

vantage that there is better telegraphic and telephonic communication from the mainland than there is from the island, and that if additional telephone lines have to be put down for the benefit of the press, that can be done at much less cost on the mainland than by laying extra cables under the Solent. Here one is quite disinterested, because, being a weekly paper THE AEROPLANE has no need of hustled history.

There is a minor advantage to the competing teams in having Calshot as the turning-point. If a machine should break down on the leg of the course towards Calshot it will be on its way home, seeing that all the machines of all the teams will be accommodated at Calshot. And if it should break down on the turn, then it can alight somewhere in that area and so can be got home more easily than if it broke down right away over by the Isle of Wight.

There is yet another, and quite an important, advantage in the second or third course which one has suggested. With the headquarters and the starting and finishing line at Ryde, when the machines are coming towards the line those who are watching them will have to look straight into the eye of the sun during the afternoon, if there should happen to be any sun. Consequently time-keepers, lap-scorers and other onlookers will find much more difficulty in identifying the machines.

With the finishing line on the North side of the Solent the machines would come to it from the East and so would be much easier to recognise before actually passing the line.

On every possible count the course which is suggested here seems immeasurably preferable to that which the Royal Aero Club has chosen. If any good arguments can be produced against altering the course as suggested one will be very pleased to publish them in THE AEROPLANE.

And, as the Royal Aero Club is supposed to exist for the purpose of propagating the Sport of Flying, and not merely to provide happy holidays in the Isle of Wight for the officials who are supposed to be organising the Schneider Contest, one suggests that a full explanation, both from the point of view of the practical aviator and that of the club financier, is due by right to the British Public, and equally to the competitors of other Nations in the contest, whose friends and helpers will be put to much unnecessary trouble and expense if the Royal Aero Club persists in sticking to what appears to be on the face of it an entirely wrong course.—C. G. G.

A NEW POWER IN THE LAND.

A new departure in British Civil Aviation which may have very far-reaching effects is indicated in a notice which was issued on June 28 by the British Aviation Insurance Group. This reads as follows:—

> The British Aviation Insurance Group beg to announce that they will in future, by special arrangement with the Air Ministry, undertake the inspection of Light Aircraft for renewal of certificates of airworthiness.
>
> Inspection work for this purpose will be undertaken in the first place under Air Ministry supervision and will be confined in the early stages to a limited number of privately owned Light Aircraft normally housed within the London area.
>
> The charge for this inspection and recommendation will be 5 guineas as heretofore, the fee being passed by the Air Ministry direct to the British Aviation Insurance Group, who will, as soon as circumstances permit, return a proportion of such fee to the owner.
>
> This fee will include the renewal of the certificate of airworthiness free of charge.
>
> This service is designed to meet the requirement of private owners and it is ultimately hoped to extend this service to other forms of civil aviation.
>
> A new Department of the Group is being formed to undertake this work and this Department will be housed in the offices of Lloyd's Register of Shipping, 71, Fenchurch Street,—the traditional home of the survey and classification of British shipping.
>
> The British Aviation Insurance Group is the only office devoted exclusively to the risks of civil aviation and it offers an unequalled world-wide service to its clients.

From the earliest days of Civil Aviation there has been an outcry against over-control of civil flying by the Air Ministry. People tried to make out that, being under the Air Ministry, Civil Aviation would be ruled with military ruthlessness. Suggestions were then made that instead of being submitted to the Aeronautical Inspection Department, who are accustomed to dealing with war machines, makers and owners of civil aircraft should be left to their own devices, but that Lloyd's, or some similar institution should, when requested by the maker or owner, issue Certificates of Airworthiness, which Certificates would in due course carry the same weight in the international market as do Lloyd's Certificates issued to sea-going ships.

The idea had much to recommend it. But if it had been adopted a great many uncertified machines with uncertified aviators would have crashed and would have earned a bad name for British Aviation. Under the wholly beneficent rule of our Department of Civil Aviation, and under the sympathetic inspection of the A.I.D., British civil aircraft already hold the reputation of being the most reliable in the World,—whatever their performances may be. And thanks to the Air Ministry and the A.I.D. we have already reached a position which might have taken many more years to reach under uncontrolled conditions.

This new step in handing over the work of the A.I.D. and of the Department of Civil Aviation to the British Aviation Insurance Group may conceivably be a step in advance. But it may also be regarded as a dangerous proceeding.

Knowing the British Aviation Insurance Group and those who run it, we can all rest assured that so long as these same people are in control the new arrangement will work for the good of everybody concerned. But conditions can be imagined under which it might do anything but good.

What the Air Ministry is doing is handing over to a commercial concern powers which should by rights only belong to a Government Department. That is to say, under the Air Navigation Act an aeroplane must be certified as airworthy, and if a pilot flies an uncertified machine he can be prosecuted for doing so. Consequently, whether he likes it or not, he must go to a certain insurance company to get the Certificate which gives him the legal right to fly.

Supposing that a pilot prefers to take his own risk on his machine and does not insure it, or supposing he wants to go and insure it with some friend who is an underwriter at Lloyd's but does not belong to the British Aviation Insurance Group, the idea is conceivable that a thoroughly bad insurance official might refuse to give his machine a certificate unless he insured it with the Group.

Such a thing could not possibly happen under the present insurance group but by creating this legal position the Air Ministry is opening up the possibility of malpractices in the future.

Either Civil Aviation ought to be entirely free, and people ought to be allowed to go and break their necks and do third party damage if they so please, or else the whole thing ought to be strictly under the control of Government officials and nobody else. Frankly, one is utterly ignorant of the customs of the shipping trade, but so far as one knows Board of Trade Certificates are issued to ships by the Board of Trade, and the rating of the individual ship at Lloyd's, whether as A1 or some inferior grading, is purely the affair of the owner of the ship. He cannot be prosecuted for putting to sea without a grading at Lloyd's.

In fact the Bureau Veritas, of Paris, runs an International Register of Shipping which does similar inspection and grading of ships, more especially of ships which are registered in foreign countries. And this same Bureau Veritas runs an International Aircraft Register whose interests may quite conceivably cut across those of the British Aviation Insurance Group.

The whole situation is in fact far more complicated than it might appear to be if one judged it solely on the entirely amiable announcement of the British Aviation Insurance Group. To put it briefly, Governmental Powers cannot lightly be handed over to a commercial concern nor can those who would humbly submit to the rulings of Government officials be expected to accept in the same spirit the *obiter dicta* of the employees of a business house.—C. G. G.

THE FINDING OF MAJOR FRANCO.

Major Franco, Major Gallarza, Captain Ruiz de Alda and mechanic Modisto Madriaga, who formed the crew of the Spanish Dornier flying-boat on which an attempt was being made to fly to New York via the Azores, were found by *H.M.S. Eagle* on the morning of June 29.

The Spanish aviators, who left the seaplane base of Los Alcazares on June 21 to fly to the Azores, as reported in THE AEROPLANE of June 26, had been missing for a week, and owing to bad weather all hope had been abandoned.

Major Franco reported that the flying-boat overshot the Azores in the dark. In trying to return thither against a strong head-wind they ran short of fuel and were forced to come down in the sea, where they remained derelict until found by the aircraft carrier. He also states that the aircraft and engines behaved magnificently.

The news of the aviators' safety has caused enormous enthusiasm in Spain and there have been public demonstrations of gratitude before the British Embassy in Madrid.

The Marqués de Estella, the Spanish Prime Minister, after consulting with his Cabinet, has announced that the Cross of Naval Merit will be awarded to the Captain and officers of the rescuing aircraft-carrier.

H.M.S. Eagle was due at Gibraltar on July 2 with the rescued aviators on board. The Dornier was salved and reports state the flying-boat has suffered little damage.

THE FAREWELL.—(1) Major Franco, (2) Major Gallarza, and (3) Capt. Ruiz de Alda bidding good-bye to (4) General Sanjurjo at Cartagena.

The first message issued by the Admiralty was the following report from *H.M.S. Eagle.*

"Dornier 16. Spanish aircraft has been found. Latitude 36.28 North, longitude 26.14 West. Aircraft has been hoisted on board H.M.S. *Eagle* with very little damage. Crew all well."

Later the Admiralty issued Major Franco's report wirelessed from the aircraft carrier as follows:—

We left Los Alcazares (Cartagena) at 17.00 hours, June 21, passing Cape St. Vincent at 21.00 hours. From the Cape we were forced to gain height owing to excessive air disturbances. From Cape St. Vincent to the Azores was an interrupted layer of cloud, above which we had to fly. Later another cloud layer formed above us.

The intended time of our arrival at the Azores was 09.00 G.M.T. on June 22, but a strong north-east wind which we were unable to foresee or check in flight caused us to pass over the Azores during the dark. At dawn we took our longitude by the sun, which showed that we were to the south-west of the Azores.

We therefore flew through the clouds and alighted to economise fuel and examine the situation more closely. We checked our position and took off, shaping a course to Fayal, but, owing to strong head-winds, ran out of petrol about 40 miles from that point.

Strong north-easterly winds drifted us to the south, and on the following day, June 23, we were about 100 miles from Fayal. The wind shifted to the south-west, reaching gale force, and drifted us to the island of Santa Maria.

From June 24 to 27 winds of varying force and direction drifted us about. On the morning of the 27th the situation was extremely dangerous on account of the wind and sea conditions.

At dawn on June 29 the aircraft-carrier *Eagle* found us in the vicinity of Santa Maria and took us on board. The behaviour of the aircraft and engines was magnificent.

THE DISSOLUTION HONOURS.

The Dissolution Honours List published in the *London Gazette* of June 28 contains the appointment to be a Privy Councillor of Sir Philip A. G. D. Sassoon, Bt., G.B.E., C.M.G., M.P., Under-Secretary of State for Air from November, 1924, to June, 1929.

THE S.B.A.C. AT OLYMPIA.

The Society of British Aircraft Constructors announce that the following arrangements have been made in connection with the International Aero Exhibition at Olympia.

On the opening day, July 16, there will be a private view by H.R.H. the Prince of Wales beginning at 12.00 hours. After the inaugural lunch, which follows, His Royal Highness will declare the Exhibition open and from 14.00 hours the public will be admitted.

A banquet will be given by the Society to Foreign visitors on July 18. This Banquet is being given because the Society wish to extend the fullest hospitality to Foreign Visitors and find that it would be impracticable to accomodate everybody at the Opening Lunch.

The Civil Aviation Ball will be held on July 19.

On July 20 an Aerial Garden-Party will be held at Heston Aerodrome.

A Reception will be held by the Royal Aeronautical Society at the Science Museum, South Kensington, on July 25, which will be followed by the Wilbur Wright Memorial Lecture.

The Exhibition will close with a Banquet at the Savoy Hotel on July 27.

A KING'S CUP COMPETITOR.—The Clarke Cheetah (Blackburne Thrush engine), designed and built by Flg. Off. J. Clarke, No. 29 (Fighter) Squadron, North Weald. The Clarke Cheetah can be converted into a biplane, but will be flown in the King's Cup Race as a monoplane.

A NEW POWER IN THE LAND.

A new departure in British Civil Aviation which may have very far-reaching effects is indicated in a notice which was issued on June 28 by the British Aviation Insurance Group. This reads as follows:—

> The British Aviation Insurance Group beg to announce that they will in future, by special arrangement with the Air Ministry, undertake the inspection of Light Aircraft for renewal of certificates of airworthiness.
>
> Inspection work for this purpose will be undertaken in the first place under Air Ministry supervision and will be confined in the early stages to a limited number of privately owned Light Aircraft normally housed within the London area.
>
> The charge for this inspection and recommendation will be 5 guineas as heretofore, the fee being passed by the Air Ministry direct to the British Aviation Insurance Group, who will, as soon as circumstances permit, return a proportion of such fee to the owner.
>
> This fee will include the renewal of the certificate of airworthiness free of charge.
>
> This service is designed to meet the requirement of private owners and it is ultimately hoped to extend this service to other forms of civil aviation.
>
> A new Department of the Group is being formed to undertake this work and this Department will be housed in the offices of Lloyd's Register of Shipping, 71, Fenchurch Street,—the traditional home of the survey and classification of British shipping.
>
> The British Aviation Insurance Group is the only office devoted exclusively to the risks of civil aviation and it offers an unequalled world-wide service to its clients.

From the earliest days of Civil Aviation there has been an outcry against over-control of civil flying by the Air Ministry. People tried to make out that, being under the Air Ministry, Civil Aviation would be ruled with military ruthlessness. Suggestions were then made that instead of being submitted to the Aeronautical Inspection Department, who are accustomed to dealing with war machines, makers and owners of civil aircraft should be left to their own devices, but that Lloyd's, or some similar institution should, when requested by the maker or owner, issue Certificates of Airworthiness, which Certificates would in due course carry the same weight in the international market as do Lloyd's Certificates issued to sea-going ships.

The idea had much to recommend it. But if it had been adopted a great many uncertified machines with uncertified aviators would have crashed and would have earned a bad name for British Aviation. Under the wholly beneficent rule of our Department of Civil Aviation, and under the sympathetic inspection of the A.I.D., British civil aircraft already hold the reputation of being the most reliable in the World,—whatever their performances may be. And thanks to the Air Ministry and the A.I.D. we have already reached a position which might have taken many more years to reach under uncontrolled conditions.

This new step in handing over the work of the A.I.D. and of the Department of Civil Aviation to the British Aviation Insurance Group may conceivably be a step in advance. But it may also be regarded as a dangerous proceeding.

Knowing the British Aviation Insurance Group and those who run it, we can all rest assured that so long as these same people are in control the new arrangement will work for the good of everybody concerned. But conditions can be imagined under which it might do anything but good.

What the Air Ministry is doing is handing over to a commercial concern powers which should by rights only belong to a Government Department. That is to say, under the Air Navigation Act an aeroplane must be certified as airworthy, and if a pilot flies an uncertified machine he can be prosecuted for doing so. Consequently, whether he likes it or not, he must go to a certain insurance company to get the Certificate which gives him the legal right to fly.

Supposing that a pilot prefers to take his own risk on his machine and does not insure it, or supposing he wants to go and insure it with some friend who is an underwriter at Lloyd's but does not belong to the British Aviation Insurance Group, the idea is conceivable that a thoroughly bad insurance official might refuse to give his machine a certificate unless he insured it with the Group.

Such a thing could not possibly happen under the present insurance group but by creating this legal position the Air Ministry is opening up the possibility of malpractices in the future.

Either Civil Aviation ought to be entirely free, and people ought to be allowed to go and break their necks and do third party damage if they so please, or else the whole thing ought to be strictly under the control of Government officials and nobody else. Frankly, one is utterly ignorant of the customs of the shipping trade, but so far as one knows Board of Trade Certificates are issued to ships by the Board of Trade, and the rating of the individual ship at Lloyd's whether as A1 or some inferior grading, is purely the affair of the owner of the ship. He cannot be prosecuted for putting to sea without a grading at Lloyd's.

In fact the Bureau Veritas, of Paris, runs an International Register of Shipping which does similar inspection and grading of ships, more especially of ships which are registered in foreign countries. And this same Bureau Veritas runs an International Aircraft Register whose interests may quite conceivably cut across those of the British Aviation Insurance Group.

The whole situation is in fact far more complicated than it might appear to be if one judged it solely on the entirely amiable announcement of the British Aviation Insurance Group. To put it briefly, Governmental Powers cannot lightly be handed over to a commercial concern nor can those who would humbly submit to the rulings of Government officials be expected to accept in the same spirit the *obiter dicta* of the employees of a business house.—C. G. G.

THE FINDING OF MAJOR FRANCO.

Major Franco, Major Gallarza, Captain Ruiz de Alda and mechanic Modisto Madriaga, who formed the crew of the Spanish Dornier flying-boat on which an attempt was being made to fly to New York via the Azores, were found by *H.M.S. Eagle* on the morning of June 29.

The Spanish aviators, who left the seaplane base of La Alcazares on June 21 to fly to the Azores, as reported in THE AEROPLANE of June 26, had been missing for a week, and owing to bad weather all hope had been abandoned.

Major Franco reported that the flying-boat overshot the Azores in the dark. In trying to return thither against a strong head-wind they ran short of fuel and were forced to come down in the sea, where they remained derelict until found by the aircraft carrier. He also states that the aircraft and engines behaved magnificently.

The news of the aviators' safety has caused enormous enthusiasm in Spain and there have been public demonstrations of gratitude before the British Embassy in Madrid.

The Marqués de Estella, the Spanish Prime Minister, after consulting with his Cabinet, has announced that the Cross of Naval Merit will be awarded to the Captain and officers of the rescuing aircraft-carrier.

H.M.S. Eagle was due at Gibraltar on July 2 with the rescued aviators on board. The Dornier was salved and reports state the flying-boat has suffered little damage.

FAIREY
AIRCRAFT

THE FAIREY AVIATION COMPANY LTD. • HAYES MIDDLESEX.

Digitized by Google

THE FAREWELL.—(1) Major Franco, (2) Major Gallarza, and (3) Capt. Ruiz de Alda bidding good-bye to (4) General Sanjurjo at Cartagena.

The first message issued by the Admiralty was the following report from *H.M.S. Eagle*.

"Dornier 16. Spanish aircraft has been found. Latitude 36.28 North, longitude 26.14 West. Aircraft has been hoisted on board H.M.S. *Eagle* with very little damage. Crew all well."

Later the Admiralty issued Major Franco's report wirelessed from the aircraft carrier as follows:—

We left Los Alcazares (Cartagena) at 17.00 hours, June 21, passing Cape St. Vincent at 21.00 hours. From the Cape we were forced to gain height owing to excessive air disturbances. From Cape St. Vincent to the Azores was an interrupted layer of cloud, above which we had to fly. Later another cloud layer formed above us.

The intended time of our arrival at the Azores was 09.00 G.M.T. on June 22, but a strong north-east wind which we were unable to fore see or check in flight caused us to pass over the Azores during th dark. At dawn we took our longitude by the sun, which showed tha we were to the south-west of the Azores.

We therefore flew through the clouds and alighted to economise fue and examine the situation more closely. We checked our positio and took off, shaping a course to Fayal, but, owing to strong heac winds, ran out of petrol about 40 miles from that point.

Strong north-easterly winds drifted us to the south, and on th following day, June 23, we were about 100 miles from Fayal. Th wind shifted to the south-west, reaching gale force, and drifted u to the island of Santa Maria.

From June 24 to 27 winds of varying force and direction drifted u about. On the morning of the 27th the situation was extreme dangerous on account of the wind and sea conditions.

At dawn on June 29 the aircraft-carrier *Eagle* found us in tl vicinity of Santa Maria and took us on board. The behaviour of tl aircraft and engines was magnificent.

THE DISSOLUTION HONOURS.

The Dissolution Honours List published in the *Londo Gazette* of June 28 contains the appointment to be a Priv Councillor of Sir Philip A. G. D. Sassoon, Bt., G.B.E., C.M.G M.P., Under-Secretary of State for Air from November, 192 to June, 1929.

THE S.B.A.C. AT OLYMPIA.

The Society of British Aircraft Constructors announce th the following arrangements have been made in connectic with the International Aero Exhibition at Olympia.

On the opening day, July 16, there will be a private vie by H.R.H. the Prince of Wales beginning at 12.00 hou After the inaugural lunch, which follows, His Royal Highne will declare the Exhibition open and from 14.00 hours t public will be admitted.

A banquet will be given by the Society to Foreign visitc on July 18. This Banquet is being given because t Society wish to extend the fullest hospitality to Forei Visitors and find that it would be impracticable to accom date everybody at the Opening Lunch.

The Civil Aviation Ball will be held on July 19.

On July 20 an Aerial Garden-Party will be held at Hest Aerodrome.

A Reception will be held by the Royal Aeronautical Socie at the Science Museum, South Kensington, on July 25, whi will be followed by the Wilbur Wright Memorial Lecture.

The Exhibition will close with a Banquet at the Sav Hotel on July 27.

A KING'S CUP COMPETITOR.—The Clarke Cheetah (Blackburne Thrush engine), designed and built by Fig. Off. J. Clarke, No. 29 (Fighter) Squadron, North Weald. The Clarke Cheetah can be converted into a biplane, but will be flown in the King's Cup Race as a monoplane.

Announcing the Cirrus Hermes.

The new 105/115 4-Cyl.-in-Line Aircooled Engine.

CIRRUS HERMES

OLYMPIA
STAND 99

¶ The "CIRRUS HERMES" engine, following the precedent created by the Mark I, II and III "CIRRUS" engines, successfully passed the AIR MINISTRY TYPE TEST at the first attempt.

¶ The "CIRRUS HERMES" can be installed on the same engine bearers as the "CIRRUS" and when fitted in Light Aircraft provides a large reserve of power.

¶ The "CIRRUS HERMES" is specially suitable for Service Training purposes, for small flying boats, for twin and triple engined aircraft, and for Light Aircraft (especially seaplanes) operating in hot climates or at high altitudes.

¶ The "CIRRUS HERMES" will be shown on our Stand at the International Aero Exhibition at Olympia, and will also be installed in Aircraft of new design exhibited by various British Manufacturers.

Side View of "CIRRUS HERMES."

Cirrus Hermes Engines are already being fitted in 19 Different types of British and Foreign Aircraft.

THE KING'S CUP RACE.

The Race for the King's Cup will start from the Heston Air Park on Friday morning next.

The first machine will leave at 08.00 hrs. but the next does not start till 08.40 and the next not till about 09.30. After that machines will be starting every few seconds till 12.00 hrs.

There were about 60 entries. But a number of machines were not built in time. Others did not get their airworthiness certificates. Others were so altered as to invalidate their certificates. So there are only about 45 machines on the programme. And of these, another half dozen or so will probably not start.

Of those whose entries gave trouble, owing to irregularities, or to insufficient information, or wrong filling-up of forms, and so forth, nearly all belonged to the Trade. Private owners showed a much higher degree of intelligence in filling in their entry-forms and in complying with regulations.

The race, as such, ought to be quite good fun. The competitors will spend Friday night at Blackpool and the first home should reach the Heston Air-Park any time after 15.30 hrs. on Saturday.

THE WEEK-END AT BLACKPOOL.

Private owners and Clubs are reminded that on July 5 and 6 The Lancashire Aero Club is holding an informal Flying Meeting at Blackpool in connection with the visit of the King's Cup competitors for the night.

Competitive events such as balloon-bursting, taxi-ing competitions, obstacle races and aerial golf will be held from 2.0 to 5.0 p.m. each day. Visiting pilots will as far as time permits be allowed to enter on arrival and will be made welcome.

The Lancashire Club request that aerial visitors will avoid arriving at Squire's Gate between 17.00 hrs. and 20.00 hrs. on Friday on account of the arrival of the King's Cup Competitors between these hours.

FLYING TO THE ANNOYANCE OF THE PUBLIC.

The following notice was issued by the Air Ministry on June 17:—

(1) In view of complaints recently made to the Air Ministry regarding the low flying of civil aircraft over the Epsom Race Course during the Derby meeting, the attention of all pilots and owners of aircraft is again directed to the general safety provisions contained in Article 9 (2) of the Air Navigation (Consolidation) Order, 1923, which reads as follows:—

"An aircraft in or over Great Britain and Northern Ireland shall not:—

(a) be used to carry out any trick flying or exhibition flying over any city or town area or populous district; or

(b) be used to carry out any trick flying or exhibition flying over any regatta, race meeting or meeting for public games or sports, except where specially arranged for in writing by the promoters of such regatta or meeting; or

(c) be flown in such circumstances as, by reason of low altitude or proximity to persons or dwellings or for any other reason, to cause unnecessary danger to any person or property on land or water."

The notice *requested* pilots to refrain from flying over Ascot at less than 1,500 ft. An *order* not to fly over the course at less than 3,000 ft. would have been more adequate. An aeroplane howling only 500 yards from a bunch of highly-strung horses is not conducive to true form.—C. G. G.

NIGHT FLYING.

Aircraft of the R.A.F. will be night-flying without navigation lights in co-operation with air defence formations as follows:—

(i) Between 21.00 hours and 01.00 hours on July 10, 17, 24 and 31 and Aug. 7 at 1,000 ft. or above on the line Lingfield to Banstead.

(ii) Between sunset and sunrise from July 1 to Aug. 11 at any height above 2,000 ft. in the area Chessington, Addington, Holmwood and Cowden.

Aircraft taking part in these exercises will switch on their navigation lights if they see any other aeroplanes in their immediate vicinity.

THE G.A.P.A.N.

The Guild of Air Pilots and Navigators of the British Empire came formally into being at a meeting on July 1. Air Vice-Marshal Sir Sefton Brancker, K.B.B., A.F.C., Director of Civil Aviation, was elected first Master, and Sir Alan Cobham was admitted as a member.

As has already been made clear in THE AEROPLANE, the object of the Guild is to uphold the status and prestige of air pilots who are qualified as air navigators and of air navigators who may not happen to be pilots. Such a Guild is certainly necessary otherwise there would be no distinct line of demarkation between air navigators and ordinary "B" licence pilots who may be allowed to fly for hire or reward on the strength of having spent so many hours in the air, but without any serious qualifications as cross-country pilots.

Members of the Guild must be British subjects and must have been for not less than five years holders of a Class "B" licence, a first-class Airship Pilot's licence, or a Certificate of Competency as a first-class navigator of commercial aircraft. Apart from this the object of the Guild is to give consideration to all questions affecting aviation and to protect and advance the interests of its members and the business of commercial aviation.

RIVALS.—Mr. and Mrs. Alan Butler (of the De Havilland Co.), who are competing against one another in the King's Cup Race.

At the meeting on July 1 a resolution was passed indicating the Guild's willingness to participate in the arrangement which already exists between the Royal Aeronautic Society, the Royal Aero Club, the Society of British Aircraft Instructors and the Air League by which each Society supports the other and does not trespass on the activities of the other. Mr. Lawrence Wingfield was elected Secretary and communications should be sent to him at Wingfield, Halse and Trustram, 61, Cheapside, E.C.2.

One of the minor problems of the Guild is the acquisition of adequate armorial bearings, such as those which are borne by the great City Companies on which the Guild is modelled. If any artistic readers of THE AEROPLANE have ideas on this subject the Guild would be glad to see them suggestions. But one would remind them that a certain knowledge of heraldry is probably advisable.

All communications from pilots desirous of joining the brotherhood of air navigators should be made to Sq. Ldr. E. L. Johnston, O.B.E., A.F.C., Harrowden House, Harrowden, Beds.

THE CHANNEL ACCIDENT.

The official Court of Inquiry into the accident to the Imperial Airways air liner *City of Ottawa* opened at the Law Courts on June 25, and continued on June 26, 27 and 28, when it was adjourned until July 2.

A report of the evidence and findings of the Court will appear in THE AEROPLANE when the Inquiry is finished.

THE NEXT PARIS AERO SHOW.

The Committee of the *Chambre Syndicale des Industries Aéronautiques* met recently under its President, M. Lioré. It has decided that the next *Salon de l'Aéronautique* in Paris shall be held next year in 1930 from Nov. 27 to Dec. 7 at the Grand Palais.

The principle of a *Salon de l'Aéronautique* every two years has been confirmed by the Committee of the *Chambre Syndicale*.

This is a very sound idea. If all goes well we may hope that having another Aero Show in 1931 is worth while, and if a British Show and a French Show can be held alternately, with a Show at Berlin say every two years in the Summer, European Aviation ought to benefit thereby.

But one has grave doubts whether a show in the Summer is the right thing. One hears on all sides of orders being held up so that buyers can see whether there is anything new at the Show, when normally they would have bought machines a month or two ago. So that, although in the long run the Show will,—we all hope,—promote trade, it has been definitely a restraint on trade for a time.

On the other hand, a Show in the Winter would still interest just at the slackest time, and the new machines which would be ordered then would be brought out by the proud owners at the first sign of fine weather. Thus work in the factories would be kept more nearly level, instead of progressing in a series of rushes.—C. G. G.

INTERNATIONAL AERO EXHIBITION

OLYMPIA

July 16-27, 1929

Come and inspect at close quarters all the latest aircraft.

A vast array of machines and engines —British, French, German, etc.— are on exhibition.

You can view at leisure, land 'planes, seaplanes and flying boats.

Engines ranging from 1,000 H.P. to 60 H.P.

Aeroplanes from the small private machine to the great triple-engined passenger-carrying craft—from the single-seat fighter to the giant bombing machine.

Many new aircraft secret machines, just released by the Air Ministry, will be displayed for the first time at this exhibition.

The greatest and most up-to-date display of aircraft ever assembled under one roof.

Don't forget the R.A.F. Display at Hendon, Sat., July 13th, 3 days before the opening of Olympia.

THE ROYAL AIR FORCE.

The London Gazette.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted perm. comns. as Plt. Offs. on probation with effect from and with seniority of June 17:—335914 Sjt. L. R. S. Freestone; 335297 Sjt. E. Coleman; 362512 Sjt. H. E. Dicken.

Lt. the Hon. J. M. Southwell, R.N., is re-attached to the R.A.F. as a Flg. Off. with effect from June 16, and with seniority of June 16, 1924; Flt. Lt. A. T. Laing continues on half-pay, scale B, during the period June 20, 1929, to Oct. 19, 1929, inclusive; Flt. Lt. L. C. Wynne-Tyson is placed on the retired list at his own request (June 18); Flg. Off. W. G. Wainwright Fahey relinquishes his S.S. comn. on account of ill-health (June 26); Lt. S. C. Woolley, R.M., Flg. Off., R.A.F., ceases to be attached to the R.A.F. on return to Corps duty (June 15); Flg. Off. E. T. St. Maur Brett is removed from the R.A.F. (June 17).

STORES BRANCH.—Flt. Lt. A. Jukes, M.B.E., is placed on the retired list (June 24).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—R. D. Bednell is granted a comn. in Class AA (ii) as a Flg. Off. on probation (June 12); F. W. Winterbotham is granted a comn. in Class C as Flg. Off. (June 25); Plt. Off. on probation R. Harston is confirmed in rank (June 25).

The following officers are transferred from Class A to Class C:—Sq. Ldr. C. H. R. Johnston (May 8); Flg. Off. H. T. Messenger (June 24). Flg. Off. P. J. Waller is transferred from Class C to Class A (June 6). The following relinquish their comns. on completion of service:—Flt. Lt. H. G. Travers, D.S.C. (June 22); Flg. Off. J. Mitchell, D.S.O., D.F.C. (June 5); Flg. Off. B. S. Wilcox, D.F.C. (June 19).

PRINCESS MARY'S R.A.F. NURSING SERVICE.

Sister Mrs. G. M. Ruttledge resigns her appointment (June 20).

Appointments.

Week ending July 2.

GENERAL DUTIES BRANCH.—Squadron Leaders S. R. Watkins, A.F.C., to Home Aircraft Depot, Henlow, 14/6. J. Noakes, A.F.C., M.M., to C.F.S., Wittering, 1/6. A. S. Ellerton, O.B.E., No. 58 Sqdn., Worthy Down, 24/6.

Flight Lieutenants R. Grice, D.F.C., to No. 26 Sqdn., Catterick, 18/6. W. E. James, to R.A.F. College, Cranwell, 15/6. N. W. F. Mason, to No. 503 Sqdn., Waddington, 13/6. G. V. Howard, D.F.C., to No. 6 Sqdn., 'Iraq, 1/6. B. A. S. Lewin, to H.M.S. *Eagle*, Mediterranean, 1/6. F. J. Fressanges, to Aircraft Park, India, 27/5. J. Bussey, to No. 22 Group H.Q., S. Farnborough, 19/6. G. T. Richardson, to R.A.F. Depot, Uxbridge, 1/7. R. D. Starley, M.C., to R.A.F. M.T. Depot, Shrewsbury, 20/6.

Flying Officers R. R. Bennett, to No. 4 Sqdn., S. Farnborough, 19/6. J. G. Franks, to Station H.Q., Hal Far, Mediterranean, 1/4. V. G. A. Hatcher, to Station H.Q., Hal Far, Mediterranean, 1/4. K. E. Parker, to No. 460 (F.T.) Flight, Mediterranean, 1/6. R. J. O. Bartlett, to No. 5 Sqdn., India, 25/5. B. C. Mason, to No. 600 Sqdn., Hendon, 17/6. J. A. T. Ryde, to No. 406 (Fleet Fighter) Flight, Donibristle, 18/6. G. D. Harvey, to H.Q., Wessex Bombing Area, Andover, 7/6.

Pilot Officers A. C. R. S. Upton, to School of Naval Co-operation, Lee-on-Solent, 17/6. J. E. Allen, to No. 450 (Fleet Spotter Reconnaissance) Flight, H.M.S. *Argus*, 16/6. E. R. White, to R.A.F. Depot, Uxbridge, 1/7. R. L. Bennet and J. H. Brown, to No. 2 Sqdn., Manston, 15/6. J. M. Israel and J. D. Robertson, to No. 4 Sqdn., S. Farnborough, 15/6. G. W. J. Jarrett, to No. 13 Sqdn., Andover, 15/6. B. F. Cox and L. V. G. Barrow, to No. 16 Sqdn., Old Sarum, 15/6. A. K. H. Binney, to No. 58 Sqdn., Worthy Down, 15/6. F. C. E. Hayter, to No. 99 Sqdn., Upper Heyford, 15/6. I. M. Smith, to No. 101 Sqdn., Bircham Newton, 15/6. W. G. Stevenson and N. W. A. Cullum, to R.A.F. Base, Gosport, 15/6. J. C. L. Claxton, D. L. Ironmonger and G. R. O'C. Lempriere, to No. 9 Sqdn., Manston, 15/6. C. N. McLoughlin, to No. 12 Sqdn., Andover, 15/6. R. J. C. Hunt and R. C. W. Ellison, to No. 26 Sqdn., Catterick, 15/6. S. A. Davis, to No. 33 Sqdn., Netheravon, 15/6. K. G. Vandyck, to No. 35 Sqdn., Bircham Newton, 15/6. J. R. Ayling and H. E. Sales, to No. 100 Sqdn., Bicester, 15/6. F. K. Wood, to R.A.F. Base, Calshot, 15/6.

MEDICAL BRANCH.—Flight Lieutenant C. J. S. O'Malley, to Station H.Q., Heliopolis, 1/6.

Flying Officers A. R. French, to Station H.Q., Hal Far, 1/4. A. P. Atkins, to R.A.F. Training Base, Leuchars, 22/6. A. C. Lysaght, to Medical Training Depot, Halton, on appointment to a S.S. Comn., 11/6.

STORES BRANCH.—Flying Officer M. F. Tomkins to M.A.E.E., Felixstowe, 1/7.

Fatal Accidents.

The Air Ministry regrets to announce that as the result of an accident near Luqait, Iraq, to a Wapiti machine of No. 30 (Bomber) Sqdn. Hinaidi, on June 27, Flt. Lt. Christopher George Halliday, the pilot of the aircraft, was killed and No. 358535 AC.1. John Laverty was slightly injured.

The Air Ministry regrets to announce that as the resul of an accident at Hendon to a Siskin machine of No. 56 (Fighter) Sqdn., North Weald, on June 27, Flg. Off. Vickers Osborne Eyre, the pilot and sole occupant of the aircraft, diec of injuries.

At the inquest on Mr. Eyre, which was held at Hendon on July 1 Flt. Lt. J. I. T. Jones said that the machines were flying in "V formation at 11,000 ft. Eyre had to pretend that he was shot dow and go into a spinning nose dive. He went down to 300 ft. and trie to right the machine, but he left it a little too late and just a the machine was beginning to right itself it struck the ground.

The R.A.F. Display.

Preparations at Hendon for the R.A.F. Display on July 1 are now well advanced. Rehearsals by the Units takin part are being held every day and the various evolution formations and combats are improving in precision and effec tiveness. Vast new stands are rising in every enclosure an the railings are being put into place. Additional space wi be provided for spectators by the omission, this year, of th New-and-Experimental-Type Park.

Perhaps this will be allotted to the 10s. enclosure and wit out any boxes in front of it. A frequent cause of mild com plaint in the last few years has been the fact that nowhe in the 10s. enclosure can the spectators get up to the fro railings as is possible in the lower-priced enclosures. The are either two rows of boxes or else the Parliamentary an Public Schools' enclosures in between. And even buyers 10s. tickets sometimes want to have a look-see at t machines landing and taking off, not to mention the resu of bomb-dropping, etc.

On the far side of the aerodrome a dock complete wit trooper lying alongside, sundry dockyard buildings, a ligh house and a concrete gun emplacement, has grown out the grass. Only a few additional details are needed for t set piece to be ready for the evening of July 13.

Squadron Leader A. H. Peck.

Sq. Ldr. A. H. Peck, D.S.O., M.C., whose appointment to the Department of the Air Member for Supply and Research, Air Ministry, is dated June 10, was born at Monufferpore, Bengal, in 1889, and was educated at Clifton and at Christ's College, Cambridge. He served in the Devon Yeomanry before the War and in December, 1914, was gazetted Second Lieutenant in the Devonshire Regiment. He was seconded to the R.F.C. in August, 1916, and appointed Flg. Off. in October of that year.

In October, 1917, he was awarded the Military Cross for conspicuous gallantry and devotion to duty. The *London Gazette* (18.1.18) adds—

He engaged single-handed three enemy aeroplanes though they had superior height. He drove them back over their lines and prevented them carrying out their reconnaissance.

In November, 1917, he was posted to No. 111 Squadron in Palestine. In March, 1918, he was appointed a Companion of the Distinguished Service Order. The *London Gazette* states:—

For conspicuous gallantry and devotion to duty. During two months' aerial fighting he has never hesitated to attack the enemy when they were in superior numbers. On one occasion when piloting a scout, he engaged a hostile formation consisting of four scouts and two two-seaters, completely dispersing them and driving one down out of control. His dash, resourcefulness and skill have been most remarked.

In April, 1918, he was appointed to command No. 144 Squadron in Palestine with the temporary rank of Major. In July, 1918, he was awarded a Bar to the Military Cross. The *London Gazette* states:—

For conspicuous gallantry and devotion to duty. While patrolling at a height of 14,000 ft. he observed a formation of five enemy aircraft attempting a reconnaissance. He attacked the top machine, a scout, and drove it down out of control. He then attacked the second scout, which he also drove down out of control. He finally attacked a two-seater and so quickly that he got to close quarters and opened fire with both guns. That too he sent down out of control. His performance was a splendid one besides being costly to the enemy.

After the Armistice he was placed on the Unemployed List for six months and was then posted to Farnborough. In October, 1919, he was awarded a permanent commission with the rank of Flight Lieutenant. In April, 1920, he was posted to No. 4 (Army Co-operation) Squadron. In January, 1921, he was posted to No. 2 Flying Training School as an Instructor. In January, 1923, he was promoted Squadron Leader and the following month he was appointed to command No. 25 Squadron, then operating at Constanti-

nople, and subsequently commanded the Squadron at Hawkinge.

In January, 1927, he went to 'Iraq to command No. 6 Armoured Car Company and in April, 1927, he became Officer Commanding the Armoured Car Wing, 'Iraq. In April, 1928, he was appointed to command No. 55 (Bomber) Squadron, 'Iraq.

Central Flying School Categories.

The following officers and airmen have been re-categoried as under from the dates stated against their names:—

A2 to A1:—Flt. Lt. R. S. Greenslade, 16.3.29; Flt. Lt. L. Darvell, M.C., 15.5.29; Flg. Off. C. Clarkson, 6.5.29; No. 87076 F-S. J. E. Brown, 15.5.29.

B1 to A2.—Flg. Off. G. J. C. Mahony, 28.5.29; Flg. Off. E. H. Newman, 4.6.29.

Courts Martial.

Orders, decorations and medals are in future to be worn by all officers and airmen when attending general and district courts martial in any capacity. K.R. (para. 230) and A.C.I. will be amended accordingly.

The R.A.F. Memorial Fund.

The Executive Committee of the R.A.F. Memorial Fund held its third meeting of the current year at the offices of the Fund on June 26. Sir Charles McLeod, Bart., Chairman and Honorary Treasurer, was in the Chair.

The proceedings were almost entirely concerned with the financial position of the Fund, which was found to be satisfactory in all respects.

The Chairman informed the Committee that the trusteeship rendered vacant by the recent death of Lord Revelstoke, had been accepted, to the great satisfaction of the Committee, by the Right Hon. the Lord Weir of Eastwood, P.C.

The Committee approved of the issue by the Grants Sub-Committee and the Secretary of Grants, amounting in all to £1,904 16s. 8d., which had been issued from the Fund between May 1 and June 25.

It was announced to the Committee that two fresh grants had been made out of the "Salting Benefaction Fund" (which has been administered by the Committee since 1920) and also two grants were reported to the Committee as having been made out of the recently instituted Educational Fund which is known as the "Anonymous Education Fund."

The Committee adjourned for the Summer vacation and will hold their next meeting on Oct. 9, at three o'clock.

The Royal Air Force Club.

Notice is hereby given that an extraordinary general meeting of the above-named Club will be held at the Royal Air Force Club, 128, Piccadilly, London, W.1, on Friday, July 12, at five o'clock (*not 6 o'clock, as previously notified*) in the afternoon for the purpose of considering, and if thought fit, passing the subjoined resolution in manner required for the passing of Extraordinary Resolutions:—

To authorise certain alterations to Rules XXIV, XXV (a) and XXVII.

Dated this 28th day of June, 1929.

A. T. WYNYARD-WRIGHT, Captain-Secretary.

Polo.

The polo match between the Royal Navy and the R.A.F. to be played at Ranelagh has been postponed until July 11.

Inter-Services Athletics.

The Inter-Services Athletic Championships will be held at Uxbridge on Aug. 31.

The R.A.F. Athletic Championships.

The R.A.F. Athletic Championships were held at Uxbridge on June 26, 27 and 29.

The King's Cup for the Unit scoring the greatest number of points in the Senior Open competition was won by Henlow with 52 points. Halton were second for 43, Uxbridge third with 41, Cranwell fourth with 36, Flowerdown fifth with 14, Manston sixth with 10, and Andover seventh with 9.

The Air Council Cup for the Unit scoring the greatest number of points in the junior competition was won by Gosport with 40 points. Sealand were second with 30, Tangmere third with 20, Duxford fourth with 15, Upavon fifth with 13. Martlesham Heath and Grantham each scored 12. Digby came next with 11, Shrewsbury with 10, Old Sarum 9, Calshot 7, Wittering 6, Netheravon and Farnborough 5 each, Ruislip 4, Donibristle 3 and Eastchurch 1.

The Air Defence of Great Britain Cup for the Unit in that Command scoring the greatest number of points, was won by Tangmere, whose 20 points for so small a Unit was a highly creditable performance.

Marshal of the Royal Air Force Sir Hugh Trenchard took the salute at the march-past of athletes by Stations on the final day. The parade was headed by the R.A.F. Ensign carried by Cpl. S. Ferris, Marathon Champion of Great Britain, 1925-6-7-8-9.

The best individual performance of the Meeting was the new R.A.F. record for the Half-mile, put up by AC. R. Thomas of Henlow, whose time of 1 min. 53.3-5 secs., beat the existing record put up by Sjt. (now Flg. Off.) Snaith by 7.1-5 secs. It is interesting to note that the London Athletic Club's time for this distance at Stamford Bridge on June 29 was 2 min. 1.3-5 secs.

In the 120 yards Hurdles, individual championship, AC. D. O. Finlay of Tangmere actually beat the R.A.F. Record for this event, put up by himself as an Aircraft Apprentice by 2-5 sec., but had the misfortune to knock over a hurdle.

There were no new R.A.F. Records in the Team and Relay events but the times were better than last year in the Two Miles Relay (Open) and the 360 yards Hurdles Relay (Junior), and the distances were better than last year in Putting-the-Shot (Open) and Long Jump (Open and Junior).

The results in detail were:—

INDIVIDUAL CHAMPIONSHIPS.

100 *yards*:—1. L-AC. T. W. Elliott (Cranwell). 2. S. M. M. Maw (Halton). 3. AC. A. Trower (Grantham). Time 10 secs.

220 *yards*:—1. L-AC. T. W. Elliott (Cranwell). 2. AC. A. Trower (Grantham). 3. Cpl. T. Tillman (Henlow). Time 23 secs.

440 *yards*:—1. L-AC. J. D. Rose (Netheravon). 2. Cpl. W. Hen (Henlow). 3. AC. L. Evans (Martlesham Heath). Time 53.3-5 secs.

880 *yards*:—1. AC. R. Thomas (Henlow). 2. L-AC. H. Hester (U bridge). 3. AC. G. Brown (Martlesham Heath). Time 1 min. 56. secs.

One Mile:—1. AC. R. Thomas (Henlow). 2. Cpl. W. Tym (Mart sham Heath). 3. AC. F. W. Turner (Uxbridge). Time 4 min. 20. secs.

Three Miles:—1. Cpl. S. Ferris (Uxbridge). 2. AC. G. Moore (U bridge). 3. AC. Laing (Upavon). Time 14 min. 59.1-5 secs.

120 *yards Hurdles*:—1. AC. D. Finlay (Tangmere). 2. L-AC. Vernon (Halton). 3. Flt. Lt. G. A. Hadley (H.Q., C.A.). Time 15. secs.

MARCHING OFF.—The Parade of Athletes by Stations marching off the Stadium on the third day of the R.A.F. Athletic Championship Meeting at Uxbridge on June 29. —(*"Aeroplane" photograph.*)

Throwing the Javelin:—1. Cpl. R. Eyles (Henlow). 2. AC. N. Matthews (Wittering). 3. AC. P. Neale (Gosport). 161 ft. 2¾ ins.

Pole Jump:—1. AC. C. Boyd (Flowerdown). 2. Plt. Off. R. Cotton (Duxford). 3. AC. H. Oram (Calshot). 10 ft. 8 in.

Two Miles Walk:—1. AC. W. Golightly (Henlow). 2. L-AC. L. T. Castle (Halton). 3. AC. W. Reeves (Uxbridge). Time 15 min. 36.4-5 secs.

Long Jump:—1. Cpl. T. Tillman (Henlow). 2. Cpl. R. H. Allan (Halton). 3. Flg. Off. F. W. Cannon (Henlow). 21 ft. 5¾ ins.

Putting the Shot:—1. S-M.1. F. Parker (Halton). 2. Plt. Off. R. Cotton (Duxford). 3. Cpl. R. Eyles (Henlow). 36 ft. 11¼ ins.

High Jump:—1. Flg. Off. F. E. Nuttall (Duxford). 2. AC. D. Finlay (Tangmere). 3. Cpl. R. H. Allan (Halton). 5 ft. 10 ins.

TEAM CHAMPIONSHIPS.

Long Jump:—(Open) 1. Halton (62 ft. 7¼ ins.), 2. Cranwell. 3. Henlow. (Junior): 1. Gosport (41 ft. 9½ ins.), 2. Tangmere, 3. Calshot.

440 *yards Relay*:—(Open): 1. Henlow (46.3-5 secs.), 2. Halton, 3. Uxbridge. (Junior): 1. Martlesham Heath (47 secs.), 2. Grantham, 3. Gosport.

Putting the Shot:—(Open): 1. Henlow (100 ft. 5¼ ins.), 2. Halton, 3. Cranwell. (Junior): 1. Gosport (65 ft. 11¼ ins.), 2. Sealand, 3. Ruislip.

One Mile:—(Open): 1. Uxbridge, 2. Henlow, 3. Cranwell. First three home, AC. R. Thomas (Henlow) 4 min. 23 secs., AC. R. Turner (Henlow), L-AC. Hester (Uxbridge). (Junior): 1. Sealand, 2. Shrewsbury, 3. Old Sarum. First three home, L-AC Plank (Shrewsbury) 4 min. 41.4-5 secs., AC. Swift (Sealand), Plt. Off. Chambers (Sealand).

High Jump:—(Open): 1. Halton (16 ft. 2 ins.), 2. Uxbridge, 3. Cranwell. (Junior): 1. Duxford (10 ft. 11¼ in.), 2. Farnborough, 3. Grantham.

Two Miles Relay:—(Open): 1. Uxbridge (8 min. 20.3-5 secs.), 2. Henlow, 3. Halton. (Junior): 1. Martlesham Heath (8 min. 38.2-5 secs.), 2. Sealand, 3. Duxford.

360 *yards Hurdle Relay*:—(Open): 1. Halton (54.1-5 secs.), 2. Henlow, 3. Flowerdown. (Junior): 1. Tangmere (50.4-5 secs.), 2. Wittering, 3. Gosport.

One Mile Relay:—(Open): 1. Henlow (3 min. 38 secs.), 2. Halton, 3. Uxbridge. (Junior): 1. Sealand (3 min. 35.4-5 secs.), 2. Netheravon, 3. Gosport.

Three Miles:—(Open): 1. Uxbridge, 2. Henlow. (Junior): 1. Gosport, 2. Upavon.

Tug-of-War:—(Open team of 10—110 stone): Henlow beat Cranwell by 2 pulls to 1 in the Final. (Junior team of 8—88 stone): Gosport beat Digby by 2 pulls to nil.

At the end of the final day Lady Trenchard presented the Trophies, Cup and Medals, to the winners, and accepted a bouquet from the Captain of the Henlow Team.

AIR SURVEY AND THE EMPIRE.

There have been occasions when the peculiar form of mental laziness known as "muddling-through" was regarded as a British virtue. Lately people have come to realise that perhaps after all muddling-through is more of a vice and that such a policy may entail enormous waste.

The linked aggregation of Powers, Dominions, Nations and Territories, painted pink on the map of the World and representing the sum of English acquisition since the inception of the race, was gained in no ordered scheme and in the most haphazard way.

The finest stories lie hidden round our Empire's beginnings and await the story-teller of imagination. Learning, however, has her history books and the Rising Generation bored with dates and the like, turns to Fiction for tales of thrills and adventures.

Anyway, to revert to the Empire, it may be that the haphazard ways of its origin account for the fact that the surveyor follows long after the colonist and town-builder, the prospector and mine operator, have followed in the footsteps of the pioneer. An even more potent reason for the delays in obtaining good maps is that survey work takes time and lifetimes may be spent in mapping new territory.

Air survey has altered all this and country can be mapped from the air long before it is really opened up. Naturally aerial survey work appears expensive, but when the decreased time-factor is taken into account this consideration disappears. Also maps for each department of the Government are obtained from the start and with no increased labour. Information for the makers of Roads and Railways, Builders of Towns, the Forestry people, the Geologists, the Agriculturists and so on is all on the photographs.

Mention of light aeroplanes is frequently made, the Light Aeroplane Clubs figure in many speeches, air-lines and airships are all familiar topics. But somehow, probably because those responsible are too busy to talk much, there is not much mention of survey work.

There is in this country a growing organisation devoted to aerial survey-work, young and healthy, backed by no government aid and progressing to such a degree that it has now on order a machine built to its own specification. This machine will be shown at the Aero Show at Olympia and will attract attention because it is the first of its kind.

Five years ago the Aircraft Operating Company Ltd., as this growing organisation is called, consisted of three directors and a part-time secretary-typist, to-day there are six directors and a staff of 150 persons. The Chairman is Mr. Alan S. Butler, to whom the de Havilland Aircraft Company Ltd. owe so much. Mr. Butler's belief in aerial survey, which he very liberally backed, is now being justified; and further as a result of the extensive experience gained by the Company in Great Britain, Africa, Asia and South America Mr. Butler feels justified in authorising the expenditure of considerable sums of money on experimental work in the Aircraft Operating Company's premises at Hendon.

The new survey machine being built by the Gloster Company is also part of the experimental programme. This machine, which will fly or climb on either of its two engines, has been designed entirely to the Aircraft Operating Company's specification.

The Aircraft Operating Company believes that their new machine is going to revolutionise the possibilities of air survey in that it will extend the field of operation and will very much accelerate the rate of working.

The company has two expeditions abroad at the present time, one in South Africa and one in Rio de Janeiro where a staff of nearly one hundred persons is being employed in the production of a large-scale map of the city and its surroundings for town-planning and development purposes. The accompanying pictures, brought home by Major H. Hemming, Managing Director of the firm, give a good idea of this work.

In 1927 the Company sent out an expedition consisting of two aeroplanes and eight European personnel to Northern Rhodesia to make a photographic survey of some mineral concessions for Rhodesian Congo Border Concessions Ltd. This particular survey afforded a good example of the economy of the method, as the geologists received the photographs on the spot and used them right away. The same photographs were used by the Aircraft Operating Company to prepare a reconnaisance survey of 12,000 square miles for the Northern Rhodesian Government.

A strip survey of the Zambesi River and its two principal tributaries the Kabompo and the Lungwebungu was made for the same Government. The survey is being prepared on a scale of 4 in. to a mile and is to ascertain the possibilities of navigation on the Zambesi.

In Northern Rhodesia the Company photographed areas of approximately 100 sq. miles round each of the principal towns in Northern Rhodesia. From these photographs maps are being prepared which will be used for town-planning and allocating land for agricultural purposes.

During 1927-28 the Anglo-Belgian Boundary Commission, which had been endeavouring to locate the water-shed between the Zambesi and Congo basins, was working on an area neighbouring the country over which the Company was actually taking photographs, and advantage was taken of this to ask the Company to photograph the watershed as nearly as could be judged from the air.

Small-scale photographs taken from a high altitude were used. The watershed was extremely difficult to find, as it was low and in places swampy, but the photographs showed clearly the trend of the watersheds. Also the source and general direction of any drainage system could be clearly seen.

Working from the ground, such systems are difficult to trace and the work is very arduous and lengthy, as drainage systems, even when found, have to be followed for some way before the basin into which they are running can be determined.

During 1928 a photographic survey of 1,000 sq. miles on both banks of the Tigris above and below Baghdad was made, as the 'Iraq Government was interested in a proposal to irrigate this area. The work in connection with the final mapping from these photographs is at present being undertaken at Hendon, where the Company's Headquarters' drawing office is situated.

The 'Irak Survey Department will receive a photographic mosaic of the area, and conventional line maps are being prepared on a scale of 1/10,000. The mosaic and line map are being made on identical sheets covering 3 mins. (60 minutes = 1°) to the side so the two may be easily compared.

The particular survey found that the traces of ancient civilisation show up quite clearly under the desert sands. All over the area ruins of large cities and ancient irrigation canals of amazing straightness may be followed quite easily. One can see that very large areas of the Mesopotamian desert bordering the two Rivers were at one time densely cultivated—hence the *Arabia Felix* of the ancients. This name was not given in sarcasm as may be sometimes thought by those who know the country now-a-days.

RIO FROM ABOVE.—A vertical view of the Avenida Rio Branco, which is seen obliquely on the opposite page.

Digitized by Google

As a result of an investigation made by Mr. R. Bourne, Lecturer at the Imperial Forestry Institute, Oxford, who was making a tour of inspection in Northern Rhodesia at the same time as the Company's expedition was working in that area, the geological survey of an area may be carried out from aerial photos. A close study of the ecology of the area, i.e. of the relation between the soils and the vegetation thereon, is first necessary, then a careful study of the aerial photographs will disclose the necessary information.

Enough has been said to enable the reader to realise the work that can be, and has been, done by air survey. When one realises that the area of the British Empire is 14,000,000 sq. miles and that only 20% has been adequately surveyed, when one considers that on all sides there are calls to develop the Empire, when one finds that, in spite of the fact that Industry is employing 300,000 more persons than in 1913 there is an increase in unemployment with a decreased emigration rate, one begins to feel that those who call for development should first call for maps.

With these the areas to be opened up could be chosen and developed. Emigrants could be then sent to territories where development was certain and not to places where it was all a terrific gamble.

There is obviously a heap of work waiting to be done by aerial survey. And one hopes that those in authority will see that it gets done.

Aerial survey has been developed by the British, and there is no doubt that to-day we lead the world in this particular enterprise. The upholders of subsidies may be interested to see that we lead, as we have always led, in an industry developed by private enterprise.—T. J.

AN ECHO OF THE "ITALIA" DISASTER.

A report in *The Times* states that the Italian Government, which had conferred posthumously on the Swedish Professor Malmgren the gold medal for Civil Valour, has assigned to his mother a yearly pension of £110, and has further sent her all the relevant documents of the commission of inquiry into the loss of the airship *Italia* off Spitsbergen last year.

AN APPRECIATION.

A regular reader of THE AEROPLANE who has spent many years as a business man and a politician writes:—

One reads your paper not merely for the news but for the occasional lifting aside of the curtain that hides the future. Being interested in the political aspect rather than the mere commercial side, I find this of no small value—so please accept this modest compliment from a twenty-year air propagandist.

ON THE FRINGE OF THE BLACK COUNTRY.

On Friday last one paid a very interesting visit to the works of Rubery Owen and Co. at Darlaston, and those of Accles and Pollock Ltd. at Oldbury.

The rail service to Birmingham from London must be one which will hold its own against any form of aerial transport for many years to come. The total journey takes only two hours by the best trains, and then lands one in the heart of the City, so it will take a lot of beating by aircraft which have to use landing grounds that may be four or or five miles outside and cannot cruise more than 90/95 miles per hour, and at that are dependent on the weather.

However aircraft business is very definitely on the increase, despite its limitations on such main line journeys. This fact was brought forcibly home when one found that both these famous firms have large extensions in course of construction to cope with their rapidly increasing trade in aircraft material.

At Rubery Owen's one saw evidence of great activity in the large shop which is laid out for the production of all types of nuts, bolts, pins, turnbuckles, thimbles, shackles, etc.

This department is, naturally, run in accordance with the A.I.D. inspection principles which govern the manufacture of all aircraft components. All material, from the time it enters the factory store to the final packing of the finished article, is subjected to the most rigid inspection.

The store for the aircraft material is separate from the motor car material store and every bar has its code colour.

The shops are well laid out and one saw a plant consisting of about 100 capstan lathes, 20 milling machines, 50 automatics, 10 drills, 15 screwing machines, 6 tapping machines and 20 nut facing machines working on aircraft components and all in full swing.

Orders are in hand for nearly all the Aircraft firms in England besides many for those firms who redistribute the various goods to firms who do not buy direct from Rubery Owen.

All the components which are made here, be they nuts, bolts, or turnbuckles, are subjected to the same rigid inspection system. And all except the small sizes are stamped, and one can safely say that the standard which has helped to give British aircraft the name it has is fully maintained.

After inspection all parts except those of stainless steel or light alloys are dipped in hot oil and vaseline and when drained are packed in grease-proof paper ready for dispatch.

The firm of Rubery Owen is well known in many other

RIO FROM ABOVE.—The Avenida Rio Branco seen obliquely. Comparison of this picture with that on the opposite page is peculiarly interesting, as showing how small the most imposing buildings may be in plan.

Digitized by Google

spheres besides that of aircraft components, and during one's tour one saw many of the large motor-car parts, such as chassis frames, wheels, axle housings, etc.; also metal tanks, bridges and buildings and other lines with which the firm deals.

Mr. Owen told one quite an amusing yarn about why he started manufacturing such a varied assortment of things. He was at a well-known motor-car works—more years ago than he cares to remember!—quoting for the erection of a steel-framed workshop. His quotation was turned down for a cheaper one, in wood, and rather than be done completely, he said, "Look here, is there any other thing I can make for you, what about those bent angle-irons?" (these were the rear part of the chassis). "Can you do things like that quickly?" asked the motor-car man. "I'll let you have a sample the day after to-morrow," replied Mr. Owen. So he got an order. That sample was delivered the following afternoon! And since then he has always gone forward starting any particular line for which he could see a demand, and never being deterred because he had so far not done anything of the kind.

The manufacture of aircraft components was started about 20 years ago and has been growing steadily until now, as already mentioned, considerable developments are under way for housing further plant for this side of the business.

Nearly 2,000 men and girls are employed at present, of whom some 800 are on the aircraft work.

After a most cheery lunch we left for Oldbury and the works of Accles and Pollock Ltd. Here one imagined one would see the tube mills most in evidence and just a certain amount of parts made from the resulting tubes, but again the varied products appear to be the most important.

One certainly saw tubes of all shapes and sizes being drawn from the "blooms." These "blooms" are the comparatively thick and short lengths of tube from which the real tubes are drawn cold, and are made at an allied firm of Accles and Pollock called Tubes Ltd., whose mills are in another part of the adjacent country. But the volume of the business done with the finished tubes was an eye-opener.

There seems to be no end to the articles now made from tube and it would be impossible to mention more than a few which one saw.

Apart from aircraft parts one only had the chance to notice things casually as time was getting short. But one saw such varied things as tables (hospital trolleys), chairs, golf club shafts, parts of motor-cycles and pedal-cycles, spanners of all shapes and sizes, motor-car parts and so on.

On the aircraft side the firm does a very large trade in stock lengths of tube of various sections and specifications with aircraft manufacturers, but many of these firms let Accles and Pollock bend and weld up the tube into various components for them, and one saw every conceivable part from engine exhaust stubs to tail-skids.

It was a revelation, and a most gratifying one at that, to learn of the size of the export business done by this firm with American aircraft manufacturing firms. Tubes of many special sections as well as specific components, chiefly in chrome-molybdenum steel, are being exported in large quantities, and one was told that at present some 150,000 feet per week are being sent over. Golf-club shafts are another product which goes to that country, these are tapered steel tubes and are astonishingly flexible. Many parts are also made for the Ford Works at Manchester.

All the aircraft tubing is subjected to the most rigid inspection and tests, and tubes are supplied conforming to all the usual B.E.S.A. and D.T.D. specifications.

At present the firm does not draw light alloy tubes, their work with this material being confined to a few special orders for manipulation.

One would have liked a whole day at each of these factories because the more one sees of such things the more one realises how little one knows of the manufacture of much which is so commonplace as an article. And where aircraft are concerned, one cannot help being reassured at seeing the growth of this side of such business. However the train had to be caught at "Brum" and one was hurried off to travel back in company with prosperous manufacturers smoking cigars whose size almost made one think they had originated from the factory of Accles and Pollock.— C. N. C.

A NEW AERODROME AT FRIEDRICHSHAFEN.

A report in *The Times* states that a new aerodrome has been built at Friedrichshafen at a cost of 350,000m [£17,500], of which 100,000m. has been subscribed by the Dornier Aviation Construction Works, and 50,000m. by Friedrichshafen, the balance having been contributed by the German Reich, the State of Württemberg, and the town of Stuttgart. There will be a regular mail and passenger service between Friedrichshafen and Stuttgart.

"THE AEROPLANE" SHOW GUIDE ISSUE

Ready July 12

Should be ORDERED NOW to assure delivery.

This issue will contain over 160 pages, in which will be given complete specifications of all the aircraft and engines which are to be at Olympia.

There will also be a list of all exhibitors.

The issue will be in itself a complete guide to the Show.

It will be sent free to all postal subscribers.

Those who buy "The Aeroplane" through newsagents should place a special order at once.

Price One Shilling.

On Sale at Stand 36, "The Aeroplane," Olympia.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE ROTTERDAM MEETING.

Away back in 1826 George Canning wrote: "In matters of Commerce the fault of the Dutch, Is offering too little and asking too much." That was something over a hundred years ago. And anyhow it is true of any keen business man whether he be a Netherlander, a Yorkshireman or a Scotsman.

Those of us who have been to the Meeting of the Rotterdam Aero Club, which took place from June 27 to June 30 inclusive, are fully convinced that in matters of hospitality and sport the fault of the Dutch is offering too much and asking nothing whatever in return. The Dutch of little old New York must have been the people from whom the modern American learned his ideas of hospitality and of "throwing a party."

Exigencies of the Press, preparations for the Aero Show, and the growing boom in aviation generally, compelled one to miss the first day of the Meeting. But on Friday, June 28, by courtesy of the Koninklijke Luchtvaart Maatschappij, commonly known as the K.L.M., certain of us were wafted to Rotterdam in a Fokker monoplane, with two French Jupiter engines, piloted by Mr. Fryns,—or Frijns, if you prefer proper Nederlands spelling.

Leaving Croydon at about 18.00 hours we landed on the Waalhaven Aerodrome at Rotterdam at about 20.15 hours. Mr. Fryns has been to Batavia and back twice by air and what he does not know about over-water flying and cross-country flying cannot be worth much. The way he handled the Fokker was a lesson in what air-line flying ought to be. He kept steadily between 1,500 and 2,000 feet, cruising nicely with his engines doing 1,600 r.p.m. and his speed varying between about 90 miles an hour climbing when he was making out towards the coast, and a little over 100 m.p.hr. on the level.

He took off across the Channel right over Dover and when he was ready to turn North-East along the French coast he had the nose of the machine dead on Calais Harbour within gliding distance of the beach. After that, with the wind blowing on-shore, instead of flying over the sea so as to avoid the bumps and save himself trouble, he flew just so far inland that if both his engines had stopped at once he would have had a straight glide head-to-wind onto the beach, which is the only place where a landing is possible all the way up the Belgian coast. And though plenty of bumps could be felt hitting the machine it hardly so much as wavered, thanks to his excellent handling. His landing was more like sitting down on a cushion than hitting the hard earth,—there was none of that plunging which generally happens after even quite a good landing. Altogether his performance was a perfect example of what air-line flying should be.

We in this country pride ourselves on the skill of our air-line and air-taxi pilots, and certainly our best are not beaten by the pilots of any other nation. But good as they may be they certainly cannot beat these K.L.M. pilots. And careful as we are in the maintenance of our aircraft there are no better kept machines in the World than those of the K.L.M., as is shown by the fact that they carry on throughout the busy part of the year with something very like 100% efficiency and without a single machine in reserve. Mr. Plesman, the Chief of the K.L.M., Mr. Martin, the Business Manager and Mr. Guillemard, the Chief Engineer, are certainly masters of their professions.

ARRIVALS AT ROTTERDAM.

Officially the Rotterdam Meeting was called the Tweede Internationaal Concours voor Sportvliegtuigen, otherwise the Second International Meeting for Sport-Flying-Machines. And if ever there was sport-flying, that was it.

The show began on Thursday with the "coming of the part-takers," otherwise the arrival of the competitors. It was run on the lines of what has now become generally known as a Rallye, and the winner was Lord Carbery on his new Moth G-AAHT. The second was Mr. H. R. Law on Moth G-EBYJ, that good sportsman Mr. R. G. Cazalet in his Widgeon was third, and there was a special award to Mr. K. K. Brown, the instructor of the Cinque Ports Club.

Quite the most sensational arrival was Mr. A. J. Richardson of the Norwich Club. Mr. Richardson learned to fly about a year ago, and he is now 67 years of age. Having had about 80 hours' dual instruction he suddenly developed into quite a good pilot in that curious way that slow learners very often do. Then he bought himself a Klemm monoplane with a Salmson engine and has been doing quite a good deal of flying since.

Having made up his mind to come to Rotterdam he argued that going all the way round by Lympne was foolish and that he might as well go in a straight line. That meant leaving the coast of Norfolk somewhere about Cromer and doing something like 120 miles of open-sea flying, most

AT WAALHAVEN.—At the top of the picture are the K.L.M. offices, and four K.L.M. machines on the ground. On the right are the sheds for K.L.M. and visiting machines. Below them is the Club-House and the Koolhoven sheds. In the middle are some of the competitors' machines. To their right rear is the Army formation, with a Belgian air-liner behind it. And in the foreground is the Navy formation

—(K.L.M. photograph.)

of it over the North Sea which is outside of the steamship lanes.

Some people remonstrated with him about it but he argued that the Klemm is all made of wood and should therefore swim quite well. And he took with him a gallon of water so that if he did have to sit and wait to be rescued he would not die of thirst for at any rate a week.

Having done many hours of flying the revolutions of his engine were down a bit, and somebody wanted to tune it up for him. But he argued that it was a French engine and ought to have a French mechanic to tune it up, and said that even if he were a few revs. short he would merely fly rather more slowly.

So somehow he got special Customs clearance at Norwich and pushed straight off across the sea for Rotterdam, arriving, like the "Old Superb," more or less with the others, in spite of a strong North wind which must have pushed him considerably off his course. Of course he was given a wonderful reception by our hosts in Holland.

A SAD TALE.

Incidentally their hospitality shows itself in all kinds of different ways. One British pilot on the night of arrival went off with a party to Scheveningen, the Brighton of the Netherlands, and somehow became separated from his friends, who, thinking that he had gone home early, went

THE NEW KULLYBUS.—Mr. Frederick Koolhoven and the FK 42 (Hermes engine).

Digitized by Google

back to Rotterdam without him. Feeling very tired he sat on a doorstep to reflect and went to sleep. There he was found by a friendly policeman and taken to the local lock-up where he slept peacefully till the morning. When he woke they gave him tea and hot shaving-water and sent him back to his anxious friends. And the Rotterdam Club fixed things all right about the fine which he was due to pay.

The official entertainment that evening was a dinner at the Yacht Club in Rotterdam, which began somewhere about 20.00 hours and went on till about 23.00 hours, followed by a dance which went on well after dawn.

ROUND HOLLAND.

On Friday there was a Height Flying Competition in the morning, and in the afternoon there was a flight round Holland. The competitors left at 14.00 hours, flew round a stated course and landed at 15.00 hours at Soesterberg, which is the great aerodrome of the Netherlands Army, and quite one of the best organised institutions of its kind in the World.

It began well under its first Commanding Officer, Colonel Walaardt Sacré, and it goes on steadily growing in quantity and quality under its present Commanding Officer, Colonel J. H. Hardenberg. Here the pilots were entertained to tea and excellently looked after in the short time they were there.

At 16.00 hours they arrived at the Schiphol Aerodrome, Amsterdam, where again they were quickly but efficiently entertained. And at 18.00 hours they arrived at Waalhaven. Everybody enjoyed the trip thoroughly.

That evening the Rotterdam Aero Club itself gave a party at the "Gâité," which is what on the Continent is called "a dancing," otherwise what we, contrariwise, call a Palais de Danse, which was closed some few weeks ago for the Summer season,—all the business people being away on holidays or going sporting in the evening. It was reopened for that one evening's party. There was a first-class band and there were liquid refreshments of the best, and there was a good floor.

The birthday of Mr. Kolff, the President of the Club, happened thereabouts,—whether before or after midnight was not quite clear,—so hosts and guests combined to signify their approval in the usual manner. The dignified Mr. Kolff was transported round the room shoulder high, and thereafter was installed in the middle while the party danced round him in rings.

Some people went home from the party as early as 02.00 hours next day, and some did not. But nearly everybody turned up bright and smiling for the first competition at 10.00 hours the following morning,—such is the excellence of the climate and the alcohol of Holland.

REAL ENTERTAINMENT.

The competitors were housed and fed, entirely at the expense of the Rotterdam Club, at the Hotel Weimar. None of the visiting competitors was allowed to pay for anything, either there or at the aerodrome. And the Hotel Weimar is just about as good as any hotel you can find in London, besides being beautifully situated on the banks of two rivers, or canals,—whichever they happen to be.

Anybody who suffered at all from sleeplessness might consider it noisy. As one of the competitors put it, all the swing bridges in Rotterdam are close to it and at dawn, when the bridges are opened for the barges to go through, the motor-cars line up waiting for the bridges to close, and "every chauffeur presses the button of his hooter as if he had just bought it." Then the bridge closes and the motors go across and then all the barges whistle till the bridge is opened again.

None of us worried about it, because those who went to bed slept the sleep of the unjust,—and the others did not care.

Over and above all this free board and lodging the Club had a whole fleet of motor-cars which were always at the disposal of any of the visitors to run backwards and forwards between the hotel and the aerodrome. And at the aerodrome itself, where there is an excellent club-house much prettier and more cheery than anything which we have in this country, there was the same unlimited hospitality as at the hotel.

The organisation of the whole thing by the Committee, and the untiring energy shown by the Secretary, Mr. de Niet, in carrying out all the schemes for the welfare of the visitors was above all praise.

Of course all this has nothing to do with flying as such,

SOMETHING NEW.—The latest Pander (Gipsy engine) with its pilot, Mr. Redele, of the Rotterdam Club.

Digitized by Google

but it has to be set down faithfully because sometimes aviators from other nations visit us here, and distinctly are *not* entertained on the same scale. So one hopes that some day we may discover somebody in this country who will enable us to give a similarly open-handed sport-flying party to our friends from other countries.

SATURDAY'S SHOW.

Saturday, June 29, being a day when a crowd can be collected, the events were mostly confined to the aerodrome itself. Flying began with a landing competition. Unfortunately, owing to the direction of the wind, the landings had to be made right away at the far side of the aerodrome where the crowd could see nothing of them. Even the special enclosure for honoured guests was at precisely the wrong side of the aerodrome.

As a matter of fact, Waalhaven being a commercial aerodrome, and the K.L.M. station being naturally next to the road, there would be considerable difficulty in so arranging competitions that the public could see anything of them without the competitors' interfering seriously with the incoming and outgoing traffic. And as there seemed to be air-line machines arriving and departing about every ten minutes all through the day the difficulty is all the greater.

Just about lunch-time, when the mere aeroplanes were all on the ground, a stork, or a heron, or one of those very large birds, chose to come along and give quite a good exhibition of gliding over the aerodrome. We came to the conclusion that although he was more efficient aerodynamically than any of the aeroplanes, he was not half as good a pilot as human beings are. His turns were horribly flat and he never made an attempt to loop or spin.

Writing of lunch recalls the one really bad thing at Waalhaven,—some of us, who were not competitors but only onlookers, wishing to avoid being a dead charge on our hospitable friends of the Club, went to the Aerodrome Restaurant to get lunch, and failed. Although there were not many people there at the time, no service could be got. The waiters were insolent and rough. And one or two people who did have food there said it was poor and dear. So we went back and had to beg some sandwiches at the Club House.

After lunch there was a Relay Race, which caused the usual attacks of neo-apoplexy. But nobody actually died.

AEROBATICS.

While the Relay Race was going on a formation of five Fokker bombing machines (with Lorraine Dietrich engines) belonging to the Netherlands Navy came over and did some extremely pretty formation flying. The day was hot and sunny with a strongish wind and consequently desperately bumpy, but the formation was excellent. Although these

AT WAALHAVEN.—The Prince-Consort at the table with Sir Sefton Brancker. Mr. Plesman, of K.L.M., is on the left.

are big-span bombers, the reliable 450 Lorraines seemed to give them ample power for anything.

After that there was a general demonstration of aerobatics by anybody who cared to go up and do it. The pilots of the Rotterdam Club in their little Pander 1½-planes were very neat and agile. And one or two of our Moths put up quite a good show, but unfortunately none of our real star aerobatic pilots happened to be there.

A WORTH-WHILE STUNT.

At 15.30 hrs. we had a show of towed gliding which was quite interesting. This is a stunt which might very well be made a first-class entertainment. Herr Espenlaub, the famous German gliding expert, had brought two machines, one a monoplane glider of his original type, and the other a thing very like it with a very small two-cylinder engine in it.

The little machine with the engine towed the glider laboriously to a height of about 1,000 feet. At that height

AT WAALHAVEN.—A view from the terrace of the Rotterdam Club-House.

the pilot of the glider slipped the wire, which was about 200 feet long, and he took about a minute and a half or two minutes to glide down again, doing circles round the aerodrome and landing quite prettily close to the crowd.

A better-made and stronger glider, which would stand throwing about, towed to a height of 3,000 feet or so by a fairly high-speed aeroplane, and then brought down in a series of loops and spins and rolls, would be very effective. To the untutored crowd it would be more exciting than a parachute drop, for they would think that without an engine the pilot would be in imminent danger, and *must* fall.

It would in fact be very much safer, besides being genuinely educative to serious aviators. And it is to be commended to the notice of organisers of flying meetings in the future.

FIRST-CLASS FORMATION.

At 16.00 hrs. or thereabouts we had one of the finest shows of formation flying that one has ever seen. Captain Versteeg, of the Flying Corps of the Netherlands Army, brought over a formation from Soesterberg. These machines are Fokker C Vs with 600 h.p. Hispano-Suiza engines. They are big two-seaters carrying wireless and guns, and they are about the last things which one would expect to see handled as if they were single-seat fighters.

But nothing seems to come amiss to these Netherlands Army pilots. And on top of that there is the fact that these C Vs are evidently very light on their controls, and that the great 600 h.p. engines answer their throttles with all the amiability of motor-cycle engines.

The formation took off with only four machines, because unfortunately one engine had set fire to its carburetter when about to start, owing to over-doping,—of the engine not the pilot.

The formation manœuvred very prettily in a diamond of four machines. Then the fifth machine, having recovere from its dope, came up and joined them. And the flyin which they did would have been a credit to our best at th R.A.F. Display.

The pilots did not indulge in anything in the way of com bined aerobatics, but in spite of the bumpy weather thei formation was quite perfect. Once when passing over th club-house, where the Prince-Consort of the Queen of th Netherlands was sitting on the terrace with Sir Sefto Brancker, the wing-tips of two machines touched, and f a moment there seemed a possibility of an accident. B the outer pilot of the two merely swerved away and with a minute was back in his old position.

When the formation broke up it did so in a perfe feather, of the type identified with the Prince of Wal and after that individual pilots did give us some aerobat flying.

One particular pilot, one fancies that it must have be Captain Versteeg himself, did the smallest loops and t quickest spins one has ever seen done with a big machi And, here be it said, the 600 h.p. Hispano-Suiza is a ve fine engine. When these machines were diving past formation they were as thrilling as were the Fairey Fox with the Curtiss D.12 engines at the R.A.F. Display.

Captain Versteeg is one of the quite early pilots of t Netherlands, and he must be all of 40 years of age. But flies with all the dash of quite a young pilot, plus th beautiful accuracy and soundness which is hardly ever fou except in a pilot of middle age. The Netherlands Army c tainly is to be congratulated on the quality of its men a machines.

COMIC RELIEF.

Later in the day we were treated to a new version

"bombing the baby." A good hefty youth in a little frock, and with a cardboard baby's head on his shoulders, rode forth onto the aerodrome on a singularly disreputable mule, which apparently took no interest in the proceedings whatever. To tell the truth the bombing was exceedingly bad, so there was nothing to excite the mule. Possibly a flour bag on his nose or tail might have produced perceptible movement.

After that some of us went back to Weimar in a K.L.M. 'bus, by courtesy of the management—the Club cars being all away. Here we had the fun of meeting the juvenile members of the Plesman family,—or the little Plespeople, as somebody called them. It was a very entertaining voyage. We came back later because that night, instead of a dance-party, there was a demonstration of night-flying.

This was really very fine indeed. Lieutenant Schmidt-Crans, the Rotterdam Club Instructor, until recently one of the Netherlands Navy's best pilots, and Lieutenant Sandberg, one of Captain Versteeg's formation pilots, went up on the Club's Panders and played about in the beams of three or four searchlights. The little silver Panders looping and rolling and spinning in the beams looked just like misguided moths round a candle. The flying was extremely pretty and very skilful.

Also one of the K.L.M. twin-engined Fokkers made several night flights, landing chiefly by the light of a motor-car headlight built into the nose of the machine. Lady Bailey went up in one of these flights and said that from the machine the lights of practically the whole of Holland could be seen.

One of the Club officials said later that there were about 30,000 people in the aerodrome during the day, not counting many more tens of thousands of "hedge-guests" outside the palisading. After the flying there were fire-works and that also entertained the crowd hugely.

Following this came a joyous ride home in a 12-seater motor-'bus with about eighteen people in it, conducted, as one Trench remarked, by a chauffeur with a fierce clutch and ginger hair. The road runs along canals and across railway lines and at one or two places there is circulating traffic round what looks like a large concrete plate,—banked the wrong way, presumably to enforce reduced speed. We seemed to take one of these on two wheels —one of them the spare.

At one cross-road a late-going street 'bus cut across us, our brakes worked admirably, and everybody nose-dived into the front of the 'bus. When we were somewhat disentangled the voice of that same Trench continued explaining,—"they run these things to schedule, and that chap was a bit late."

Still, we missed his tail-lamp by a good half-inch and arrived home quite happily. And regretfully one left a deep Anglo-Dutch argument on Service flying and the equipment of army co-operation machines while the sky was still more or less dark.

SUNDAY'S FLYING.

Sunday's flying was mostly kept within the aerodrome. There was a Get-Off competition, and there was the final of the relay-race, and there was Espenlaub's glider performance, there was some balloon bursting, and there was also a Speed Race.

AT WAALHAVEN.—The Hon. Lady Bailey (right) and Mrs. Walter Longton, who flew with her from England and accompanied her in the competitions. This was the only feminine crew in the Meeting,—and, so far as can be remembered, is the first feminine crew to compete right through a flying meeting.

This speed race was run over a course well outside the aerodrome, and for a while there was some anxiety because two of the pilots who had gone out over the course did not come back. Eventually they were found to have landed safely, though the country round that part of Holland, consisting of big rivers or of tiny fields cut up by dykes, is about as bad as it can be for forced landings.

An interesting thing about this race was that the new Koolhoven monoplane with a A.D.C. Cirrus-Hermes engine made its first appearance piloted by Lieut. Schmidt-Crans. It was certainly faster than anything else in the air except

THE ARMY'S LATEST.—The CV Fokker, with 600 h.p. Hispano Suisa engine.

perhaps the Gipsy-engined Pander with the clipped wings. And it obviously handled excellently.

The race was actually won by Lady Bailey because the Koolhoven machine was flying *hors concours*. Mr. Frederick Koolhoven did not expect it to be finished in time, so he had not entered it for any races. But it created a very good impression.

Just after the Speed Race Flt. Lt. Shaw, late R.A.F., and now of National Flying Services Ltd., took up somebody else's Moth and did some very pretty flying with it. Also he took up the Koolhoven Coupé monoplane, with the Siemens radial engine in it of only 60 h.p., and showed what an astonishingly good get-off it has for so small an engine. He expressed his surprise at its unstallability coupled with its controllability.

A Problem in Acoustics.

All through the Meeting the K.L.M. twin-engined Fokkers had been taking up joy-ride passengers as hard as they could. Their performance impressed on one the accuracy of Air Vice-Marshal Sir Sefton Brancker's remark at a Royal Aeronautical Society meeting a good many months ago.

Some of our high-browed scientists had been discussing, with their usual lack of practical sense, the question of noise in aircraft, and Sir Sefton, always practical, tried to persuade them that the noise which an aeroplane makes when heard from the ground had nothing whatever to do with the noisiness of the same machine's cabin.

Coming over in the twin-engined Fokker one was struck by its comparative quietness. Polite conversation would have been difficult, but remarks about places along the way were quite easy. But when those machines were getting off, as they passed the enclosure at a distance of perhaps 400 yards, for a matter of five or six seconds while they were actually passing, the engines made a shattering noise just about as loud as that of the diving Foxes at the R.A.F. Display, and even when shouting the human voice was inaudible.

At the meeting aforementioned Sir Sefton had commented on this phenomenon and said that the noise on the ground was caused by the reflection of the sound from the monoplane wings. The amount of noise is all the more remarkable because the engines have exhaust-rings and are not firing into the open. Of all sciences the Science of Acoustics seems to be the least understood, but the Mediæval architects knew something about sounding-boards which our aircraft designers do not.

The Close of the Meeting.

After the flying was over at about 18.00 hours General Schneiders, still as active as need be in mind and body at the age of 76, proceeded to present the prizes.

General Schneiders commanded the Netherlands Army when flying first began and did everything possible to encourage military aviation in Holland when other countries were only thinking about Service flying. During the War 1914-18 when the Flying Services of the Queen of Holland were mobilised to protect the country against invasion (by Germany from the land and by England from the sea) General Schneiders was Commander-in-Chief of the combined sea and land Services and did his work most ably. Though now a civilian he takes the keenest interest in flying.

He made a very graceful speech in perfect English, saying how pleased the Netherlanders were to see so many visitors and said, that while congratulating Lady Bailey on the prizes which she had won, they could hardly add to the laurels which she had acquired by her great flight round Africa.

He then presented the prizes for the Arrival Competition the first prize to Lord Carbery, the second to Mr. Law, and the third to Mr. Cazalet. Mr. Brown was not there to receive his special prize, as he had gone back to the Cinque Ports Club to work on Friday.

The prizes for the the Relay Race went to Lady Bailey Mr. Jackaman and Mr. L. Richardson (not he of the Klemm). The magnificent Cup which was given for the principal competition, the Flight Round Holland, and the best all-round performance, was won by Mr. Jackaman, with Mr. "Harold Brooklyn" second, Lord Carbery third, and Lady Bailey fourth.

The first prize in the Landing Competition went to Mr. Jackaman, and a special consolation prize was awarded to Miss Winifred Brown.

Thereafter Mr. Kolff returned thanks to General Schneiders. And the British contingent, which was very strong numerically and vocally, gave three rousing cheers for our hosts.

Everybody went back to the Weimar early, because there was going to be an official closing banquet. Because of the demands of The Aeroplane, which meant getting this article and the accompanying photographs, into black and white on Monday or not at all, one had to tear oneself away from what looked like being the grand climax of the whole show. In the words of one of the guests, these people of the Rotterdam Club certainly can "push out a good boat."

A Lesson in Air Transport.

After that one had a lesson in the benefits of air transport. At the Hook of Holland one was stowed away in a 24-year-old boat with turbines which were built in the dark ages of the form of machinery, among a pentecostal crew of aliens obviously affluent and all loud-voiced. The boat was gross overcrowded and was consequently late in leaving.

Apparently it could not make up lost time by running

THE STANDARD TRAINING MACHINE.—One of the Club Panders (Walter engine).

Digitized by Google

full throttle, so it was nearly an hour late at Harwich. There was more delay getting masses of baggage out of the boat onto the train, or through the Customs, so we sat in that wretched train, which should have left at about 06.30 hours, till something much nearer 08.30 hours, and arrived at Liverpool Street as many hours overdue as would have allowed a K.L.M. machine to travel all the way from Rotterdam to Croydon.

Apparently our beautiful London and North Eastern Railway, which is built up of several competing lines amalgamated to promote efficiency with the result that they have merely lost the spur of competition, thinks less about being a couple of hours late on a little run like that than Imperial Airways would think about the Air Mail being late from Karachi to Croydon. So much for our highly organised rail and water transport.

If only somebody with really big money behind them would start in and organise air transport properly, and advertise it as lavishly as the railways advertise, air transport would very soon be a better paying business than railway transport.

By the time one has paid for taxies and tipped porters and stewards and waiters, and paid for meals on a boat and paid for meals on a train, and taken in the value of time wasted and energy uselessly expended, and moral and intellectual damage generally, there is no doubt that rail-and-boat transport costs the passenger more in the end than does air transport.

Anyhow, in spite of the L. and N.E.R., the photographs and the writer of these notes did ultimately arrive in London and here are the results.

A RECORD OF THOSE PRESENT.

For historical purposes the expenditure of the necessary space in which to record what machines were at the Meeting seems justified. To begin with there were the five Fokkers of the Army formation, and there were the five Fokkers of the Navy formation. Then there were two Fokkers belonging to K.L.M., which were continually taking up joy-riders during the Meeting.

The other Netherlands machines were:—PH-AGO, the new Koolhoven open tandem two-seater with the Hermes engine; PH-AER, the Koolhoven Coupé with the Siemens engine; PH-AEV, a new Pander of the old type with a Walter engine; PH-ADV, PH-ADW and PH-AEJ, all old-type Panders belonging to the Club, PH-AGM, one of the new speed-model Panders with a Gipsy engine; and PH-AGN, one of the new model with a Cirrus. Also there was a Pander labelled in large letters "Sopla," evidently used only for flying within Holland for advertisement purposes. That made 21 Netherlands machines in all.

Of Belgian machines there were:—OO-AKJ, a side-by-side thick-wing full-cantilever monoplane with a 5-cylinder Renault; OO-AGH and OO-AJG, two-bay biplanes with Renard engines; OO-AJJ, a two-bay biplane with a 10-cylinder Anzani belonging to the Antwerp Club; OO-AJU, a single-bay biplane with a 5-cylinder Anzani; OO-AJP, another two-bay biplane; OO-ABI, a little thick wing monoplane, the St. Hubert, which one last saw when only the fuselage had been built by the S.A.B.C.A. engineer, Mr. Joseph Goudentops; and OO-AKG, a monoplane very like a Widgeon. (Eight in all.)

Sad to say there was only one-and-a-half German machines, namely, Mr. Espenlaub's tiny machine, labelled "Dapolin," also as an advertisement, and his glider, which can only be counted as a half.

There was one French machine, FA-JGB, a queer little low-wing monoplane built by M. Delanne. It looks very like a wooden Junkers and it certainly has a great deal to recommend it. On top of the fuselage is a sort of conservatory in which pilot and passenger sit side-by-side. The machine is fitted with a fire-extinguisher, a compressed-air starter, a turn-indicator, which must mop up a good deal of air power in its working, and two parachutes. The engine is an Anzani of problematical power. If the engine disintegrates, or if the fire-extinguisher does not work, then you pull one bolt, and the whole conservatory comes off the top and you climb out with your parachute. To ensure ease and comfort in getting over the side M. Lalanne has thoughtfully provided a hand-rail along the outside of the fuselage.

There was one American, NC8809, a Stearman biplane with a Wright Whirlwind and two open cockpits in tandem. It was painted blue and red and yellow with an arrow all along the fuselage to show it which way to go, and the name "Hollywood" in large letters on the arrow. Its crew consisted of two quaint Americans known respectively as "Chet" and "Ross." One knows that, because each had his name painted on the side of his own cockpit, apparently in case either might get into the wrong hole. Rumour said that those were only the first syllables of their first names and that they have proper surnames as well. One is long and thin, the other short and thick, and their clothes are as alarming as the colour-scheme of their biplane. Chet (or Ross), the long one, wears brown and white shoes and startling black and white stockings. Ross (or Chet), the short one, wears the most paralysing jumper and stockings to match of a black and red and yellow tartan apparently designed by a cinematographic Scot. And Sunday being cold he wore on top of this a kind of Zouave jacket of black monkey fur. They threaten to come to England for the R.A.F. Display. Unfortunately none but Service machines are allowed in the arena, or they would be a great success with the crowd.

The list of British visitors is long and varied. It is given just as one jotted down the numbers and not in any kind of order. G-EBYJ, Mr. H. R. Law's Cirrus-Moth; G-AAHE, Avian (Cirrus) belonging to Mr. Cubitt of the Norfolk Club; G-EBQX, the Norfolk Club Moth presented by Messrs. Holmes and Hardy, and flown by Messrs. Moore and Brett; G-EBXE, a Norfolk Avian flown by Messrs. Gough and Surtees; G-EBGS, Mr. Tyzack's Moth with Flt. Lt. Shaw; G-EBRM, Mr. Cazalet's famous Widgeon; G-EBVZ, Miss Brown's Avian with Mr. Adam; G-AAAG, Moth; G-EBUR, Moth, Mr. and Mrs. Ivor McClure; G-EBST, single-seat Moth, Mr. Downes-Shaw; G-AABH, Moth; G-AAHT, Moth, Lord Carbery; G-EBRQ, Widgeon, Mr. "Harold Brooklyn"; G-AAEE, Moth, Lady Bailey and Mrs. Longton; G-AABX, Moth, Mr. Jackaman; G-EBPQ, a black and white Moth, Mr. L. Richardson (?); G-AAAV, Moth, Mr. Cooper; G-EBRI, the Cinque Ports Club Moth, Mr. Brown; and there was Mr. A. J. Richardson's little Klemm. (19 in all.)

The pity is that even more British pilots did not go to Rotterdam. Our friends in Holland would have been delighted to entertain them, and nowhere can a better time be had than in Holland. But, as one has said in the beginning, there is really no way of getting back on our hosts in Holland, so, unless we can raise something by way of retaliation before this time next year, no decent British aviator will have the face to go to Holland again.—C. G. G.

A NEW LIGHT AEROPLANE.—The Parnall Elf (Cirrus-Hermes engine), which has just been completed by George Parnall and Co. of Yate, Bristol. This machine will be at the Aero Show.—(*"Aeroplane" photograph.*)

THE PROGRESS OF THE "SOUTHERN CROSS."

The tri-motored Fokker (Whirlwind engines) *Southern Cross* piloted by Mr. Kingsford Smith left Sydney on June 25 for Derby on the North coast of Australia. The machine arrived at Derby on June 26, and left again on June 27 for Singapore. It reached Singapore on June 28 and left for Rangoon on June 29. Magneto trouble with one of the engines is delaying the party at Rangoon.

All reports of the journey refer merely to "Captain Kingsford Smith and his companions." No names are given, and no mention is made of Mr. Ulm. Therefore the conclusion seems obvious that, because of the censure of Mr. Ulm by the Committee of Enquiry in Australia, concerning the allegations that the landing of the *Southern Cross*, which cost the lives of Mr. Keith Anderson and Mr. Hitchcock, was a publicity stunt, Mr. Ulm is no longer a companion of Mr. Kingsford Smith.

ACROSS AMERICA AND BACK.

Captain Frank Hawks, who recently beat the record for the flight from Los Angeles to New York while flying a Lockheed Air Express monoplane with a Wasp engine and N.A.C.A. cowling, has put up a new record for the double trip across the Continent and back.

Capt. Hawks, who is an air-mail pilot on the trans-Continental route, flew on June 27 from New York to Los Angeles in 19 hrs. 10 min. 32 sec. He reached New York again at 01.16 hrs. on June 29, after a flight of 17 hrs. 38 min. 56 sec. from Los Angeles. His flying time was thus 36 hrs. 49 min. 28 sec. No information is yet to hand as to the time of his departure from New York on Thursday, so the total time taken is not available. Seven hours were reported as being wasted by repairs to a leaking carburettor.

THE ROYAL AERONAUTICAL SOCIETY.

At a Council Meeting of the Royal Aeronautical Society, with which is incorporated the Institution of Aeronautical Engineers, Col. the Master of Sempill, A.F.C., A.F.R.Ae.S., was elected President for the year October 1929-1930.

The following were elected Vice-Presidents of the Society for the year October 1929-1930:—

Air Vice-Marshal Sir Vyell Vyvyan, K.C.B., D.S.O.
Lt. Col. J. T. C. Moore-Brabazon, M.C., F.R.Ae.S., M.I.Ae.E.
Mr. H. E. Wimperis, C.B.E., F.R.Ae.S.

LARGER AND LARGER.

The largest aviation company in the United States has just been formed by the amalgamation of the Wright Aeronautical Corporation with the Curtiss Aeroplane and Motor Company. The capital is £14,000,000. Nine smaller companies are affected by the amalgamation.

The new combine will endeavour to secure expansion abroad by means of associated companies in Canada and in Europe.

There seems to be so much financial re-arranging and so much organisation of distributing agencies in the States that the mere layman is tempted to ask whether there is any aviation product in the World ready for finance and distribution in such elevated terms.

A NEW LIGHT AEROPLANE.—A side view of the Parnall Elf (Cirrus-Hermes engine) with wings folded. George Parnall and Co. have equipped their works to produce this machine in quantities.

FOR THE KING'S CUP.—An Avro Avian IV (Cirrus-Hermes engine) with a metal fuselage, which will be competing in the race for the King's Cup.

A NEW CHANNEL ISLANDS SERVICE.

A new flying-boat service to the Channel Islands was billed to open on June 29, and will run daily henceforth to Jersey from Southampton (Woolston) and back, calling at Guernsey on each trip outward and homeward.

The service is in the hands of the Tour and Travel Association Limited, who have taken over the Woolston Air Port near Southampton from Imperial Airways and will operate from there.

The company has bought several Supermarine amphibian flying-boats, with Napier Lion engines, and has had the boats modified to carry one pilot and six passengers. Every machine is to have Handley Page Slots.

The machines will leave Woolston at 11.30 hrs. each day and will arrive at Guernsey at 12.45 hrs. and at Jersey at 13.25 hrs. On the return journey they will leave Jersey at 17.45 hrs., Guernsey at 18.30 hrs. and arrive at Woolston at 19.45 hrs. On Sundays the machines will leave Woolston at 12.15 hrs. and Jersey at 17.20 hrs.

The return fares to Guernsey and Jersey are £6 10s. from Woolston, and between Guernsey and Jersey £1 15s. return.

The company hopes to be able to duplicate the service shortly and also to run day trips at reduced rates. They also hope, at a later date, to be able to cater for private parties for air tours of the coasts of France and Spain.

THE NORFOLK AND NORWICH AERO CLUB.

The second Annual General Meeting of the shareholders of the Norfolk and Norwich Aero Club was held on June 25. Mr. A. A. Rice (Chairman) presenting the Report, said that the membership, which had stood at 162 in 1927-8, had increased to 384 for 1928-9. After writing off £494 for depreciation the accounts showed a profit of £417 on the year's working. This had been made possible chiefly by the income derived from the Government subsidy, which had amounted to £1,201.

The Club had had no serious accident throughout the year although 846 hours had been flown, much of it in bad weather and including a number of extension cross-country flights

The first 250 members of the Club had been admitted without payment of entrance fee. Now that this number had been passed the Council had decided to charge an entrance fee to all new members of £3 3s. for flying members and £1 1s. for associates.

The Club had three aeroplanes, two Moths and an Avian. Also four private owners used the aerodrome and Club facilities. With the impending production of cheaper aircraft the Management Committee might probably have to consider the question of increased hangar accommodation. The City Council, which had a claim on the aerodrome, was interested in developing the City as an air port and the Club's position in regard to the aerodrome might be involved.

The Report and Accounts were approved.

For eight vacancies on the Council the following were elected:—C. R. Bignold, N. Brett, J. Collier, C. G. Gowing, R. J. W. Moore, J. D. North, A. A. Rice, G. F. Surtees.

Mr. C. R. A. Hammond was re-elected hon. treasurer, Mr. H. O. Bennett hon. secretary, and Mr. R. G. Adcock hon. auditor, the Chairman expressing the thanks of the Club to these officers.

Mr. A. A. Rice, on the question of the election of chairman, said he had been their chairman ever since the Club was formed and felt that someone should be chosen for the position who had more time.

Capt. Cater, proposing that Mr. Rice should again be their chairman, said they would like to thank him for all he had done for the Club in the last year. Mr. Rice was one of the few people capable of doing the job in the way he had done it in the past. (Applause.) Mr. Barrett seconded the proposition, which was carried unanimously.

Mr. Rice, returning thanks for the honour they had done him, hoped that next year someone else would come forward.

Before the business proper began the President (Mr. H. N. Holmes) made a presentation to Mr. F. Gough (Managing Director) from a large number of members. It consisted of a gold cigarette box and cigarette case. Mr. Holmes said that Mr. Gough had sacrificed a good deal of his ordinary business for the benefit of the Club and had done an immense amount of work for it. The presentation was an expression of the Club's deep appreciation.

PROGRESS AT NOTTINGHAM.

The Nottingham Aero Club has to give up its quarters at Hucknall at the end of July and, accordingly, is moving to Tollerton where the Nottingham City Council is making its municipal aerodrome.

The question of accommodation has not yet been settled. The City Council may possibly build sheds and a club-house and let them to the Club or the Club may have to construct their own buildings and come to some arrangement with the Council over the tenancy of the land.

A further suggestion is that the Club should be allowed to use the aerodrome on condition that it undertakes to maintain certain services including keeping a pilot and machine there ready to fly to any part of the country to order. This would give the Club a leg up until it was in a position to build for itself.

The move to Tollerton ought to improve the affairs of the Club, the progress of which has been seriously handicapped by the need for a club-house. Tollerton is only four miles from Nottingham and there is a very large Country-Club-Hotel there which is only separated by a couple of fields from the Tollerton Flying Ground,—which ought to be a distinct attraction to visiting aviators.

In spite of its handicaps the Nottingham Aero Club continues to make steady progress both in hours flown and in the number of its members. And in Flt. Lt. R. L. Bateman it has a capable pilot-instructor who is not only keen on flying but has a businesslike way of doing things which ought to make the club a commercial success.

THE BROOKLANDS SCHOOL.

The Moth Showroom at Brooklands has now been opened. Within the first two days the new Gipsy-Moth on show was sold to Mr. G. D. Shallabear. Evidently Moths are quick-selling stock. The School has already sold Moth G-ERRX to Mr. R. D. King.

CLUB RECORDS.

The recent fine weather has helped Club flying a good deal. The Bristol Club has broken its record for a single day's flying by putting in 14 hours and 40 minutes, which, with one Instructor (Mr. E. W. B. Bartlett) and two machines, is very good going. The Newcastle Club has broken its record for a week's flying having done 61 hours 30 minutes. The Instructor, Mr. G. M. S. Kemp, is to be congratulated.

A CHOICE OF ENGINES.

The Desoutter Aircraft Co. Ltd. intimate that the standard engine for the Desoutter Sports Coupé, the modernised version of which, as it will actually be supplied to customers, was described and illustrated in THE AEROPLANE, is the Cirrus Mark III. with the Cirrus-Hermes as an alternative. The D.H. Gipsy engine can be fitted when specially ordered.

FLYING TRAINING MANUAL, PART I.

Flying Training Manual, Part I, which has been out of print for some time, has now been re-printed and copies may be had from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, E.C.4, at 3s. 9d. post free.

This is an Air Ministry publication containing all the accumulated knowledge of the Air Force, and is the best and cheapest book in the World on the subject.

No Visitor to London should miss the

ROYAL AIR FORCE DISPLAY

Hendon Aerodrome

Saturday, July 13th

The Display is designed to afford an opportunity to the public to witness the progress and efficiency of the Royal Air Force in a series of Service exercises that hold the sustained interest of spectators from first to last. Nearly 200 aeroplanes will take part.

PROGRAMME

Great air battle and attack on a fortified port, involving its destruction by bombing. Individual combats in the air. Crazy flying. Air races. Balloon hunting. Air drill. Parachute dropping. Aerobatics, and other spectacular events.

Booking now proceeding at Messrs. Keith Prowse and other Agencies.

ENCLOSURES—Tickets 10/- and 5/-.

RESERVED SEATS in Grand Stands, 3/- and 2/6 extra.

Car tickets (including chauffeur), 7/6, 5/-, and 2/-.

2/- Tickets at Aerodrome on day of Display.

WORLD'S GREATEST AIR PAGEANT.

Accommodation for 100,000 spectators and 15,000 cars.

CROYDON NOTES.

Talking to Mr. van Lear Black immediately after his arrival back in London, one gathered that his unfortunate experiences at Dum Dum Aerodrome, Calcutta, had done nothing to damp his enthusiasm for flying. His boat and train journey back from India indeed has done a great deal to confirm him in his opinion that there is only one method of travel for a gentleman, and in consequence he is busy preparing plans for more flying as soon as he can obtain a new machine. [British Manufacturers please note.—C. G. G.]

A fairly strong difference of opinion seems to exist regarding the aerodrome obstruction markings at Dum Dum Aerodrome where Mr. Black's three-engined Fokker stood on its nose in a soft patch.

Messrs. Geysendorffer and Scholte never saw any obstruction marks at all and these pilots have far too much experience to taxi into a clearly marked danger-zone when en route to Tokio and back via Siberia. In this case therefore it seems fairly clear that something was wrong with the aerodrome organisation and not with two of the finest and most experienced long-distance touring pilots in existence.

The trip was not abandoned on account of the upending of the plane in the Dum Dum swamps as some people seem to imagine, but on account of a record gale which sprang up the same night and tore the machine from its moorings and bowled it over and over like a fallen leaf. Incidentally it jumped a small hedge in the course of its involuntary flight.

A story is told here at Croydon of a certain well-known pilot, whose identity we must disguise under the fictitious name of Organ P. Golley. This aviator flew to a certain north-country city and on landing was accosted by a charming individual who earnestly required him to come and be introduced to the Mayor. Such is the retiring and modest disposition of our hero that he flatly refused to come forth into the blinding glare of personal publicity.

Moreover he was inspired to damn all Mayors, Corporations, Municipal bodies, Town Clerks, Beadles and Bum-Bailiffs into large heaps, and especially the Mayor of the City which was then trying to arrange a Civic ovation for him. Eventually the charming stranger pointed out he could hardly weigh in for the official (free) lunch unless he sort of said "howdy bo" to the Mayor. With that our gallant aeronaut stepped forward with a blush and performed the necessary handshake.

All the way to the Town Hall in the municipal Bentley the charming stranger chuckled and giggled to himself and at last Mr. Golley, feeling he might have a blob of Castrol "R" in one of his ears or something, asked him why he was so mirthful. The stranger apologised and said that Mr. Golley's remarks about the Mayor had delighted him hugely, inasmuch as the Mayor was his paternal relative.

It is recorded in letters of gold, to be read from right to left or up and down as the case may be, in the annals of the Aerodrome that Miss Anna May Wong crossed to Paris by Imperial Airways on Tuesday, July 2.

The inquiry into the loss of the *City of Ottawa* on June 17 has been a Heaven-sent opportunity for certain persons more remarkable for their verbosity than for their intelligence to make all manner of surprising comments.

One of the best was a fairly well known designer of aircraft who urged that motor boats travelling at 45 miles per hour should travel ceaselessly to and from across the Channel looking for aircraft which might be in trouble. This would be especially beneficial in a thick fog, and other fast motor boats could be kept handy to go to the rescue of the first lot and so on *ad infinitum*.—SPRY.

STAG LANE NOTES.

An interesting order placed during last week was for a Gipsy-Moth, with inter-changeable float and ski undercarriage, by Sir Douglas Mawson for use on his forthcoming Antarctic Expedition. Sir Douglas's ship, the *Discovery*, will leave London at the end of this month bound for Cape Town where she will pick up the pilot and mechanic for the Moth who are coming from Australia.

New English private owners are Major Allen, M.C., of Oxford, Mr. G. D. Shellabear, of the Eccentric Club, Mr F. S. Lee, of Exeter, and Mr. C. J. Scaramanga (through Malcolm Campbell Ltd., St. James's Street).

A new Spanish private owner is Senor Latona.

Apropos the rescue of the crew of the Spanish Dornier Wal in the Atlantic off the Azores by *H.M.S. Eagle* there is interest in recalling that one of the crew—Major Gallarza—only recently flew a Moth from Stag Lane to Madrid in company with three other Spanish pilots. These four Moths were for delivery to the Compania Espanola de Trabajos Fotogrametricos Aeroeos and were specially adapted to take special Zeiss survey cameras.

Herr Udet took part in the Berlin Flying Day held at the Tempelhoferfeld on June 23 with the Genet-Moth, formerly G-EBOU, and with it he performed the outside loop and other advanced manœuvres. This particular machine was one of a batch of six built for the Air Ministry which took part in the 1927 R.A.F. Display. Later it became the property of Flt. Lt. F. O. Soden, who this year disposed of it in part exchange for a new Gipsy-Moth through Malcolm Campbell Ltd. This latter company sold it to Herr Udet and after reconditioning by the De Havilland Company it was flown away from Stag Lane to Germany by her new owner.

This machine has probably endured more complicated stunting than any other light aeroplane not only in this country at the R.A.F. Display and at sundry flying meetings but also at the 1928 Orly Meeting and now in Berlin.

An interested visitor to Stag Lane last week was the Hon William Finlayson, Minister of Lands and Forests, Ontario, accompanied by his son, daughter and a friend. They all had flights in a Moth. Mr. Finlayson flew in the first Gipsy-Moth to arrive in Canada and by virtue of his post in Canada he is familiar with the good work done by Moths in forestry patrol and other work by the Ontario Provincial Air Service.

AIR-PORT M.O.s.

Mr. Stuart Hirst, one of the pioneers of commercial aviation many years before the War 1914-18, writes:—

A paragraph that struck me on account of its future significance appeared under your Croydon Notes dated June 19. You said there was a feeling at Croydon that the time had come when the amount of passenger traffic called for the provision of a resident medical officer. You have here touched, perhaps unconsciously, upon an important oncoming need in air transport. Just as we have our Port Sanitary Authority for the seaboard, I think very soon we shall require to establish under the authority of the Air Ministry an Air-Port Sanitary Authority.

It is not merely a matter of medical aid in case of personal illness upon arrival of aircraft, but a matter of checking the propagation of infectious disease. The fact that aerial journeys from distant infected countries can now be accomplished in times less than the incubation periods of certain major infectious diseases calls for serious thought.

Passengers by air from India, for example, may now land at Croydon in the incubation stage of Eastern small-pox and for all that is thought or done at present subsequent development of the disease may occur in the midst of a large community. The time taken up for travel by sea permits of a warning by manifestation of the disease en route. The recent *Tuscania* incident at Marseilles illustrates the point. In view of the amount of infectious disease prevalent in India and the Far East preventive methods will certainly have to be considered by the Air Ministry.

An article on the subject of "Air Travel and Public Health" appears in this month's issue of the technical journal *Public Health*. Owing to the intelligence and foresight displayed by the writer I would recommend you getting a copy of the journal and making your comments.

I believe the Air Ministry have already had trouble on this matter and Sir Sefton Brancker tells me that it is one of his problems of which he does not see a solution at present.

About a year ago there was a plague in 'Iraq and all passengers coming from 'Iraq to Europe had to be put into quarantine at the Heliopolis Aerodrome for some days. The discomfort of tent life will not help to popularise air transport.

While the writer in *Public Health* rather accentuates small-pox I believe this is really unimportant as compared with plague and cholera, which are going to be our great difficulties in the East. Directly the journey from London to Karachi is being done in four days this problem will become even more complicated, and I suggest that your advocacy of the establishment of an Air Port Sanitary Authority will be what we journalists know as "intelligent anticipation."

[Let Mr. Hirst have all the credit for the intelligent anticipation. The case for Air-Port Medical Officers could not be put better. The way out of the quarantine difficulty seems to be that adopted by the French Authorities lately,—namely to put each person coming from an infected country under observation for the period of incubation. Let them go to their homes, or other destinations, with a health card, which has to be signed every day—or perhaps every second day—by a doctor till the quarantine period is over.—C. G. G.]

NEW COMPANIES.

Liverpool Air Lines Ltd.—Private company. Registered June 26. Capital, £100 in £5 shares. Objects: To carry on the business of constructors, designers, manufacturers and letters on hire of and dealers in aeroplanes, aeroplane engines, airships and flying machines of all kinds, organisers and providers of private and public conveyances, etc.

The subscribers (each with one share) are: W. W. Mattingly, 4[illegible] Witherington Road, Highbury, N.5, secretary of a fidelity guarantee association. A. G. Langley, 82, St. Ann's Road, Notting Hill, W.1[illegible] clerk. Solicitors: Wainwright Pollock and Co., 9, Bush Lane, E.C.4.

Mono-Spar Company.—Mono-Spar Company Limited was registered as a "private" company on June 25 with a nominal capital of £12,40[illegible] in 8,000 "A" shares of 1s. each and 12,000 "B" shares of £1 each. The holders of the "A" shares are entitled to half the net amount certified as the annual profit until the sums reserved in dividends on such shares amount to £30,000 and thereafter to 40%. The holders of the "B" shares are entitled to the residue. On a winding up the assets available for distribution are to be paid as to 40% proportionately to the holders of "A" shares and as to the remaining 60% rateable to the holders of the "B" shares. The objects are to engage in any scheme or business for the development, investigation, financing or encouragement of aircraft, aeronautic and airship construction and in conjunction therewith or apart therefrom, to carry on business in all its branches and in any part of the world as a general trading and investment trust, mortgage, finance and agency, company especially in businesses concerned with aeroplanes, airships and aeronautic development, and with its subsidiary apparatus, appliances and inventions, etc.

The first directors (to number not less than 2 nor more than [illegible]) are:—H. J. Stieger, 54, Bathgate Road, Wimbledon, designer. R. A. Haga Haig, 5, Clarendon Street, S.W.1, consulting engineer. A. E. Chorlton, 55, Lower Belgrave Street, S.W.1, consulting engineer. W. S. Stephenson, 143, Harley Street, W., engineer. C. W. Haywar[illegible] Rosedale, Dunstall Road, Wolverhampton, engineer. A. H. Ka[illegible] Dalkeith, Upper Park Road, Kingston Hill, sales manager. M. [illegible] Bramson, 26, Hanover Square, W., engineer. G. O. Mitchell, Co[illegible] Wood Cottage, Ducks Hill, Northwood, solicitor. The three first nam[illegible] are to hold office for three years. Secretary (pro tem.): G. O. Mitche[illegible] Solicitors: Norman Hart and Mitchell, 21, Panton Street, S.W.1. T[illegible] registered office is at 4, Broad Street Place, E.C.3.

PERSONAL NOTICES.

Deaths.

EYRE.—On June 27, at Redhill Hospital, as the result of a flyi[illegible] accident at Hendon on the same day, Vickers Osbourne Eyre, Flg. O[illegible] R.A.F.

Mr. Eyre passed out of Cranwell, where he was a Flight Ca[illegible] Serjeant, in December, 1925, and was posted to No. 56 (Fighter) Sq[illegible] He was promoted Flying Officer in June, 1927. No. 56 (F) Sqdn. w[illegible] practising for the R.A.F. Display when the accident happened.

HALLIDAY.—On June 27, at Luquait, 'Iraq, as the result of a flyi[illegible] accident, Flt. Lt. Christopher George Halliday, R.A.F.

Flt. Lt. Halliday served with the R.A.F. during the War 1914-18 a[illegible] retired in 1919. In August, 1920, he rejoined the Service with [illegible] rank of Flying Officer and was posted to the R.A.F. Depot, Uxbrid[illegible] In April, 1921, he was posted to No. 39 Sqdn. and in March, 19[illegible] he was transferred to No. 100 Sqdn., then at Spittlegate. In Janua[illegible] 1925, he was promoted Flight Lieutenant and shortly after he [illegible] posted to the Experimental Section, R.A.E., Farnborough. In Aug[illegible] 1925, he went to Halton to the Training Flight. In March, 1928, [illegible] was posted to the Aircraft Depot, Hinaidi, 'Iraq.

Marriages.

FESTING-SMITH—MAGUIRE.—On June 20, Patrick de Cou[illegible] Festing-Smith, R.A.F., only son of the late Alfred Charles Festi[illegible] Smith, L.R.C.P., L.R.C.S., of St. Budeaux, and the Hon. Mrs. Win[illegible] botham, of Ambury, Cheltenham, to Edith Ann Veronica, youn[illegible] daughter of the late Daniel Maguire, of Country Monaghan, Irela[illegible] and of Mrs. Maguire, of Liverpool.

TRACE—JOHNSON.—On June 17, at The Cathedral, Salisbury, [illegible] Rhodesia, Garth Trace, D.F.C., elder son of Mr. and Mrs. James Tr[illegible] of Bournemouth, to Doris Mary, only daughter of Lieut.-Col. H. [illegible] and Mrs. Johnson, of Sheffield.

Forthcoming Marriage.

COLQUHOUN—KINGSLEY.—The engagement is announced betw[illegible] Flt. Lt. James Woods Colquhoun, R.A.F., eldest son of the Rev. R. [illegible] and Mrs. Colquhoun, of Congresbury, Somerset, and Miss J[illegible] Kingsley, daughter of the late Mr. A. Kingsley and Mrs. Kings[illegible] Shakespeare Road, Bedford.

Births.

BUSK.—On June 27, at 4, Banks Terrace, Sheerness, to Enid, [illegible] of Flt. Lt. C. W. Busk, M.C., A.F.C., R.A.F.—a son (stillborn).

GOLDIE.—On June 21, to Sylvia Mary, wife of Flt. Lt. A. H. Gol[illegible] R.A.F. (formerly Bedfordshire Regt.), of The Mount, Harefield R[illegible] Uxbridge—a son.

LYWOOD.—On June 21, at a nursing home, Uxbridge, to Hi[illegible] wife of Sq. Ldr. O. G. Lywood, R.A.F.—a son.

STEVENTON.—On June 18, at "Mantua," Birchington-on-Sea, [illegible] Doris (*née* Barnes), wife of Flg. Off. C. F. Steventon, R.A.F [illegible] daughter (still-born).

PRACTICAL FLYING.

"A" Licences are Cheaper at Reading.—Moth Machines. No waiting. First-class Instructors and Equipment. Phillips and Powis School of Flying, Reading Aerodrome. 'Phone 2633.

BROOKLANDS SCHOOL OF FLYING employs three pilots who have been instructing since 1916. Take advantage of their experience and let them teach you on a Moth or an Avro. Private accommodation on the aerodrome, which is only 50 minutes by rail or road from Waterloo. 'Phone: Byfleet 436-7. Visit our Stand No. 180 at Olympia.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth Equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone. 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—**LEARN AT LYMPNE.**

Lancashire School of Aviation Limited.—"A" and "B" Licenses. £3 per hr. Apply "Airwise," Squires Gate, Blackpool.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines, Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS VACANT.

Wanted, Good Ground Engineer at once, for Le Rhone Avros. Apply Box No. 5671, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Certificated Ground Engineer required at once by Scottish Flying Club. Apply Secretary, Moorpark Aerodrome, Renfrew.

The Westland Aircraft Works, Yeovil, have vacancies for Aircraft Fitters and Erectors, also Tool Makers used to Press Work. Capable men can be assured of continuous work, at the district rate plus production bonus. Apply personally, or by letter, with age and experience, to Labour Clerk, as above.

MISCELLANEOUS.

A leave suggestion.—A Country Holiday at Lake Vyrnwy Hotel and its beautiful estate of 10,000 acres. Trout fishing, lake and rivers. Grouse, pheasant, duck and rabbit shooting. Hill-hunting, riding, tennis.—Further particulars apply Graham Martin, Lake Vyrnwy Hotel, via Oswestry.

"Chequers Inn," Slaugham, Board Resident. Golf and coarse fishing half-mile. London 35 miles. Brighton 17 miles. Proprietor.

Petrolmotor Castings, partly machined, ½ horse, 9s. 9d. per set. Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

Schneider Cup Visitors accommodation—view from windows overlooking pier S. Parade and I.O. Wight. Write Caudwell, 8, Redcliffe Gardens, Southsea.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Riggings, and Aero-Engine Fitting and Riggings; also expert training for Ground Engineers (Categories A, B, C and D) and Special Pilots (Licence B). Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, London, W.C.2.

ON THE KING'S CUP RACE.

THE DAWN PATROL.—Getting ready for the start at Heston. Mr. Broad's "Pull-over" or "Turkish Bath" is in the foreground.

For once in a way the King's Cup Race has been an undiluted success,—except for those competitors who did not win. Whether the cause was the increasing airmindedness of the public, or whether it was the topographical attraction of Heston Air-Park, or whether it was the businesslike enthusiasm of the Proprietors of the Air-Park one does not pretend to say, but on a cold, windy and threatening-to-be-wet morning there were more people out to see the start than there have ever been at a King's Cup Race. And at the finish not only were there far more people than have ever come to see the finish of a King's Cup Race (at any rate since the immediately post-war enthusiasm of the popular press died down), but the people who came to Heston were distinctly of a better class than have ever assembled at any air meet with the exception of the R.A.F. Pageant.

This is not said in any spirit of snobbishness, but merely to show that the right people, that is to say the people whose support has all along been necessary to make aviation a success, are taking an active interest in flying. Let us hope that the Aero Show will demonstrate that this interest is going to take a practical form in hard cash.

At the Start.

Heston Air-Park, for all its cheeriness, was a mighty cold place when the competing machines turned out on Friday morning. The first away was Flt. Lt. Ashton in the old familiar H.A.C. II Minus, G-EBOO. Presumably it is called Minus because it has lost its lower plane since it was first built. The little light aircraft was, to use the stock aerodrome phrase, "bumped to blazes" getting off, but it got away in good style. The next away, forty minutes later, was Mr. H. H. Leech, R.A.F., in the sole surviving original Baby Avro (Cirrus I). Just what happened has not been learned, but the machine bounced and trickled the whole length of the aerodrome without getting off. He taxied back to the starting line, made the necessary adjustment, and got away quite well considering the age and low power of the machine.

Over half-an-hour later the first of what might be called the big light-aeroplanes went. This was a Simmonds Spartan (Cirrus III), booked to be piloted by Lieut.-Col. Strange. Unfortunately he was ill, so Mr. Staniland, the firm's test pilot, took it over. Then two minutes afterwards went Mr. H. V. Ashworth in the first of the Avians (Cirrus II). At the same time Mr. V. N. Dickinson, of Birmingham, in a Moth X (Cirrus II), and Capt. H. H. Balfour, M.C., our latest flying member of Parliament, also in a Moth X (Cirrus II), and Flt. Lt. T. B. Bruce, M.C., in a Simmonds Spartan (Cirrus III), and Mr. G. E. F. Boyes, of National Flying Services, likewise in a Spartan (Cirrus III), were booked to start. But actually they were started at half-minute intervals, and the odd half-minute was adjusted in their starting time at Blackpool next morning.

Four minutes later went Mr. H. R. Law, who is the son of the late Mr. Bonar Law, with Mr. MacDonald, R.A.F., in a Moth X (Cirrus II). Why they were giving four minutes' start to machines of precisely similar specification was not evident, but the handicappers knew best. On the same mark was Mr. R. W. Jackson, R.A.F., in a Spartan (Cirrus III), also pulled back four minutes compared with similar machines.

THE FIRST AWAY.—Flt. Lt. Ashton taxying out to the start on the Halton "Minus."

Digitized by Google

AN ANCESTOR.—Mr. Leech (and passenger) getting off in the original Baby Avro. —(*"Aeroplane" photograph.*)

Three-and-a-half minutes behind him went Colonel the Master of Sempill in one of the new Bluebird IVs (Cirrus III). Presumably the handicappers were suspicious that the catalogue performance figures were too modest, or else they assumed that Col. Sempill's experience can get a good many miles more out of an aeroplane than the engine gives it normally.

A minute behind him was Wing Commander E. R. Manning, D.S.O., M.C., in his own Westland Widgeon III (Cirrus III), who was given six minutes' start from Mr. R. G. Cazalet in a precisely similar machine. The difference in this case seemingly was that Wing Commander Manning had a passenger and Mr. Cazalet had fitted a lid over his passenger seat and was flying alone.

On the same mark as Mr. Cazalet was Lieut. L. G. Richardson, R.N., in a Moth (Cirrus III). Lieut. Richardson, as is now pretty well known, turned out to be second in the King's Cup Race and to be the winner of the Siddeley Trophy,—a good show.

The next away was Flt. Lt. C. F. le Poer Trench, R.A.F., in an Avian (Cirrus III) all alone, with the machine stripped and streamlined to the last ounce. His handicap was cut down by five minutes because when the handicappers saw the machine it looked so much faster than any self-respecting Avian ought to be.

THE GIPSY BRIGADE.

Just behind him came the first of the Gipsy-Moths flown by Lieut. A. M. Kimmins, R.N., who is a Flight Lieutenant in the Fleet Air Arm. This was on the same mark as an identical machine flown by Mr. B. E. Lewis, of Malcolm Campbell Ltd., with Flt. Lt. J. G. D. Armour, R.A.F., who served in the same squadron with him during the War. Their take-off was the first sensational effort of the morning. Getting off at the same time as Lieut. Kimmins, either Mr. Lewis or Flt. Lt. Armour (whoever happened to be handling the controls at the moment) held the machine down on the ground till she was well up to her speed, jerked her up into the air and threw her round onto her right shoulder, gaining about a hundred yards on the turn down-wind.

A minute and a half later Mr. D. S. Schreiber, a new and very sporting private owner, started in a Gipsy-Moth with Flt. Lt. David Bonham-Carter (who has recently qualified for membership of the Caterpillar Club) as passenger. Rumour had it that Mr. Schreiber, being still a new pilot, was not a good insurable risk for a race, so he imported Flt. Lt. Bonham-Carter to satisfy the demands of Mr. Lamplugh of the British Aviation Insurance Group. The result showed good judgment on the part of all concerned.

On the same mark was the first matrimonial crew in the race, Mr. and Mr. J. W. P. Chalmers, also in a Gipsy-Moth. If one's memory serves, this is the first time that a husband and wife have flown in the same machine in an important race. Incidentally also this was the first machine in the race with slots, and the said slots insisted on opening while the machine was on the ground,—which seemed to worry some of the friends of the crew somewhat.

Also on the same mark was Mr. P. P. Grey, in a Gipsy-Moth, and Capt. W. R. Bailey in a Gipsy Coupé-Moth, and Mr. M. Brunton in an X-Moth (Cirrus III). In this case the apparently curious arrangement of handicap was due to the fact that Mr. Brunton was flying alone and had the front seat of the X-Moth covered over.

The next pair to go were Mr. G. Thorne, R.A.F., in an Avian I (Cirrus II), solus and streamlined, and Mr. "Wellworth," or "Woolworth," in a Widgeon III (Armstrong Siddeley Genet). The number of the machine, G-EBRQ, will be familiar to readers of this paper. This time the owner was flying without a passenger, and had the front seat streamlined in, so it was not as at Rotterdam.

After that went Mrs. Alan Butler in her Gipsy-Moth Coupé with Mr. Reeves of the De Havilland Co. as chief engineer and spare pilot.

The next starter was Mr. A. F. Wallace in a Gipsy-Moth. After him went Mr. C. S. Napier, alone in a Widgeon

BAD LUCK.—Mr. Staniland in the Simmonds Spartan, who sank at Hamilton. —(*"Aeroplane" photograph.*)

England to India

4130

miles

without stop

"The two Royal Air Force pilots, Squadron-Leader A. G. Jones-Williams and Flight-Lieut. N. H. Jenkins, who flew non-stop to India in a Fairey monoplane in just under 49 hours, returned to-day to Cranwell Aerodrome with very little more ceremony than that attached to the start of their flight of 4130 miles.

The engine, a Napier Lion of 530 horsepower, not only ran perfectly throughout the flight, but was not touched until it had covered another 2500 miles on the return journey to Egypt. Then, it was explained, more as a matter of precaution than anything else, it was given a top overhaul. Certainly to-day when the graceful monoplane with its 82 feet spread of wing came flying over the aerodrome, the engine was running as sweetly as if it had just left the Works."

The Times—17/6/29.

THE LEADING WIDGEON.—Wing Cdr. Manning going out to the start. —(*"Aeroplane" photograph.*)

THE SPEEDED-UP AVIAN.—Flt. Lt. Le Poer Trench in the cowled and streamlined single-seater. —(*"Aeroplane" photograph.*)

(Gipsy),—the only Gipsy-engined Widgeon of which one wots. Mr. Napier is the son of Mr. Montagu Napier of D. Napier and Son Ltd., the great engine makers, and has only learned to fly comparatively recently. He has the makings of a very good pilot.

On the same mark with him was Mr. A. C. M. Jackaman, alone in his Bath-Moth (Gipsy), and Capt. Geoffrey d Havilland with a passenger. Why Capt. de Havilland with passenger should be on the same mark with Mr. Jackama alone is one of those little mysteries of handicapping ex plainable only by the supposition that, good pilot as is M Jackaman, the handicapper has a still higher opinion c

AT HESTON AIR PARK.—Mr. G. Thorne (Avian, Cirrus II) and Mr. "Woolworth" (Widgeon, Genet) just starting. —(*"Aeroplane" photograph.*)

Digitized by Google

AN UNUSUAL COMBINATION.—Mr. C. S. Napier (the son of Mr. Montagu Napier, of D. Napier and Son Ltd.) in a Westland Widgeon with a De Havilland Gipsy engine, starting from Heston.

Capt. de Havilland. The results showed that the handicapper was right, as Capt. de Havilland finished two places ahead of Mr. Jackaman.

FEMININE COMPETITION.

Miss Winifred Spooner was the next starter, alone in her very much streamlined Gipsy-Moth, giving one-and-a-half minutes to Capt. de Havilland. She got off with one of the most perfect turns of all the starters.

Mr. J. D. Irving of the Newcastle Club in a Gipsy-Moth was on the same mark as Miss Spooner and one-and-a-half minutes after him went Lady Bailey, alone in her Coupé-Moth.

That finished the normal, or almost normal, light aeroplanes in the race. From then on there was rather more variety about the machines.

Hereabouts happened a distinctly funny incident. A little Press photographer came up to a group of us standing by the next machine to start and wanted to know what machine had number 2 on its tail, because just when it was going a man had rushed up and kissed the pilot. Reference to our programme showed that the pilot was a distinguished officer in the Air Force and the action, though doubtless indicative of affection, seemed unusual in any of the British Services, though, judging by the number of bewhiskered Frenchmen who dashed onto the Court and kissed the French victors at Wimbledon, it might not seem so unusual across the Channel. Further inquiry discovered that another machine started at the same time as this particular one, whereas the accused officer had started on his own. A little further study of the programme showed that of the two machines that started one was piloted by a feminine competitor whose brother had come to see her off and quite naturally bade her a fond farewell.

A VARIETY SHOW.

The next starter was No. 7 in the entries,—Flt. Lt. T. Rose, D.F.C., formerly of the Midland Club, flying an S.E.5a (Airdisco engine) belonging to Mr. W. L. Handley, a member of the Midland Club. In past years we have all become so accustomed to the S.E.5a that we have almost learned to regard it as an aeroplane. Only after watching the strings of Moths and Avians and Widgeons starting and then bumping into this funny old kite did one realise what an atrocity it was. And yet the wretched thing used to get along quite well during the War 1914-18 with a bare 180 h.p. Flt. Lt. Rose's take-off was worthy of his reputation as a pilot and instructor.

After him went Mr. Neville Stack, A.F.C., in an Avian IV M (Cirrus-Hermes engine),—the first public appearance of the Hermes. The machine had the special cowling designed by A.D.C. Aircraft Ltd. for the Hermes, and the rest of the machine was streamlined down to the last projection till, as a bystander said, it had about as much head-resistance as an orange pip,—and the Hermes engine sounded beautiful.

THOSE WICKED HANDICAPPERS.

Mr. Stack had been handicapped on the assumption that his machine would be something like an ordinary Avian, but with the extra power of the Hermes. When the handicappers saw it, and the way it had been cleaned up, they rushed for their slide-rules, ran them rapidly up and down, and, by the time they had got them to the verge of overheating, decided that Mr. Stack must have nine minutes docked off his handicap. Whereupon Mr. Stack was escorted to the starting line uttering low moans and proclaiming to the World that his chance of winning the King's Cup Race was now destroyed entirely, though he had had hopes of winning it before.

On the other hand, even knocking ten minutes off his original handicap did not console the pilots of the Speed-Moths, who were still set by the handicappers the task of giving him anything between ten and twenty minutes on the first day's flying. Judging by the fact that Mr. Stack was wailing about not having enough start, and that Messrs. Hope, Butler and Broad were firmly convinced that he had

too much start, one came to the conclusion that the handicappers were not very far out.

THE SPEED STUFF.

The next starter was Mr. W. Lawrence Hope, who won the race last year and the year before. He was flying a Gipsy-Moth painted bright scarlet, and streamlined down to about the same degree as Mr. Stack's Avian. Also it had tiny little wheels not much bigger than furniture-castors, and one was moved to wonder whether in next year's race we should see the Moths starting off on "domes of silence."

In starting Mr. Hope put his right wing-tip firmly on the ground, at least it looked like it, after travelling about twenty yards, spun round on it, hooked himself into the air, and went straight off on a steady fast climb to about 1,000 feet, where he would get every breath of wind that was blowing. Which was very wise seeing that the wind happened to be going at about 40 miles an hour the same way that he was.

Some of the less experienced pilots, and several who ought to have known better, started by flying low, although

INTERNATIONAL AERO EXHIBITION OLYMPIA

July 16-27, 1929

Come and inspect at close quarters all the latest aircraft.

A vast array of machines and engines —British, French, German, etc.— are on exhibition.

You can view at leisure, land 'planes, seaplanes and flying boats.

Engines ranging from 1,000 H.P. to 60 H.P.

Aeroplanes from the small private machine to the great triple-engined passenger-carrying craft—from the single-seat fighter to the giant bombing machine.

Many new aircraft secret machines, just released by the Air Ministry, will be displayed for the first time at this exhibition.

The greatest and most up-to-date display of aircraft ever assembled under one roof.

Don't forget the R.A.F. Display at Hendon, Sat., July 13th, 3 days before the opening of Olympia.

DUM SPIRO SPERO.—Mr. Lawrence Hope, in the first streamlined Moth, setting out to retrieve the Cup. —("Aeroplane" photograph.)

there was a favouring wind, which was obviously much stronger higher up. They had evidently got into their heads the idea that hedge-hopping was the right thing on a windy day, regardless of whether the wind was ahead or aft.

Mr. Alan Butler, who started about five-and-a-half minutes behind Mr. Hope, was also flying a well-streamlined Gipsy-Moth. One of Mr. Butler's outstanding characteristics is his apparently irresistible desire to tell the truth,—a rather unusual characteristic either in sport or business. He said quite frankly, before he got into his machine, that their engines were the only thing the De Havilland speed-team had to worry about. The engines had very naturally been tuned up to pretty nearly the last ounce, and so, he said, the great thing would be "to keep 'em ticking."

The proof of how well all the Gipsies had been tuned is that out of sixteen Gipsy-Moths which started only one, that flown by Mr. Lewis and Flt. Lt. Armour, was brought down by engine stoppage,—and that stoppage was not the fault of the engine, as will appear hereafter.

Mr. Hubert Broad's Moth, entered by Sir Charles Wakefield, was the last of the light aeroplanes. It was one degree more streamlined than the rest, and that fact, coupled with Mr. Broad's vast experience, was probably why he had to give five minutes' start to Mr. Butler and ten minutes to Mr. Hope.

The cockpit was covered over by a little cap, or lid, the top of which was within an inch of the top of Mr. Broad's skull. The front windows were so close to his face that he said they were just like looking through a large pair of spectacles. The two side windows were made to slide back so that the cockpit was quite well ventilated, and, although from the outside there appeared no possibility of the pilot having any view at all, Mr. Broad said that it gave him just as good a view as any machine with an open cockpit. In effect, closing the lid was almost exactly the same thing as putting on a flying cap with goggles.

Being white (or cream) and green, like Mr. Jackaman's bath-room Moth, it was promptly nicknamed "the Turkish Bath." And certainly its speed on the first day, when Mr Broad picked up 10 mins. on Mr. Stack, indicated that it must be pretty hot.

The next starter was Mr. A. H. Wheeler, R.A.F., in a S.E.5a (Viper), entered by the Duke of Northumberland. Here again we had a sight of what used to be, and were moved to wonder how on earth such a mass of wires and struts and odd pieces could be pushed through the air as fast as the thing used to go.

HORS CONCOURS.

The next starters after this were outside of the Competition. One was G-EBMR, a Handley Page with two Rolls Royce Eagles, which Mr. Van Lear Black had chartered to take himself and a few friends, first of all to Lympne, and then to Blackpool, to see as much of the race as possible.

As the great lumbering thing came taxying across the aerodrome and swung round head-to-wind its tail-skid ploughed a huge furrow in the delicate young grass of the Air-Park. It was an excellent example of how we in this country cling to antiquated ideas. In America tail-skids are practically obsolete and tail-wheels fitted with brakes are universal,—in heavy machines at any rate. How long are we likely to go on allowing tail-skids to commit atrocities on our aerodromes in this country when in any intelligent community they would have been prohibited two years ago at least.

The other non-competitor was Sir Sefton Brancker, in a Coupé Moth flown by Flt. Lt. J. I. T. Jones,—commanding the Communication Squadron at Hendon. The machine was a cream-and-blue demonstration machine belonging to the D.H. Co., and very smart it looked.

MORE ANTIQUES.

After the old Handley Page had lumbered off there was

THE TURKISH BATH.—Mr. Broad's Moth (Gipsy) with the lid closed, and Mr. Broad in front.
—(" *Aeroplane* " *photograph.*)

wait of three-quarters of an hour before the two Grebes started. One, entered by Sir Walter Preston, the new M.P. for Cheltenham and that part of the World, who is showing strong symptoms of airmindedness, was flown by Mr. R. L. R. Atcherley, R.A.F., under the *nom de vol* of "R. Llewellyn,"—Somebody suggested that he ought to have taken the Shakspearian form of his name—Fluellyn—because he flew well in the race.

The other Grebe, with Mr. E. H. Fielden, A.F.C., late R.A.F., as pilot, carried as passenger Squadron Leader the Right Honourable F. E. Guest, C.B.E., D.S.O.,—the entrant of the machine. Sq. Ldr. Guest has always been a sportsman, a great hunting man and polo player, and he has been in most of the wars which have happened since his childhood, but he is not quite a young man in these days, so that his performance in flying round the course in such appalling weather in the back seat of a machine which was intended to be a single-seater is no mean effort.

A curious point about these two machines is that they both bore Service lettering and markings and were apparently not registered as civil machines. This seems somehow to need some explanation from the Air Ministry.

The fact that there should still be machines of this type to enter for a big race, and that anybody should think it worth their while to enter them and still more that one of them should win the race, is an amazing example of how little we have progressed in the last ten years. Intrinsically the Grebe is the direct descendant of all the B.Es. and S.Es. that were ever built, crossed with the Sopwith Pup,—which resulted in the Nighthawk, built by the B.A.T. Co. in 1919, which was the grandfather, or perhaps even the father, of the Grebe.

The only essential difference is that they have the excellent Armstrong Siddeley Jaguar engine instead of the entirely unreliable Dragonfly, and that the structure has been strengthened up to stand its weight and power. The Grebes have been Service equipment in the R.A.F. for at least five years, and they have been abolished. So the fact that the race for the King's Cup, which was intended not merely to stir up interest in aviation all round Great Britain but was also intended to promote the production of ne and efficient aircraft, should be won by a machine which very nearly a genuine antique, is utterly pathetic.

The last away was Mr. J. Summers, the new test pilot Vickers Ltd., in the Vickers 141 (Rolls-Royce FXI). It a peared in the programme as a single-seater, but it is qui big enough for a three-seat fleet-spotter. The relationsh between it and the Victoria is as obvious as the relationsh between a whale and its calf. All the same, it got off tl ground quite quickly and the engine sounded lovely.

THE NORWICH CONTROL.

Observed by C. M. McAlery.

The first stopping-place in the race for the King's Cu was the Mousehold Aerodrome, Norwich, the Headquarte of the Norfolk and Norwich Aero Club. All the arrangemen for the Norwich control were handled by officials of tl Club. The timekeepers at Norwich were Mr. T. D. Dutt and Mr. F. T. Bidlake. Help was also given by the Adjutar 84th Brigade, R.F.A. (T.A.), who loaned field telephones ar provided an operator; the Norfolk Branch of the Briti Red Cross Society, who provided an ambulance; and M Seaman, who has grazing rights over the aerodrome ar arranged to keep his stock from interfering with the race.

A Royal Air Force detachment from Bircham Newt maintained wireless communication with the other contro and the meteorological information centres, and also su plied a Hucks-Ford starter in case of need. Wing C Hubbard flew over from Bircham Newton in a Service Ly Aero, and provided the only non-competing visiting aer plane.

A good number of Club members and other spectatc turned up at the aerodrome by car and on foot in spite the early hour and the fact that it was a week-day.

Mr. J. W. Pickthorn, of the Norfolk and Norwich Ae Club, broadcast what the B.B.C. call a "running comme tary" on the race, which added very considerably to t interest of the spectators. His supercharged eyesight warn them of the approach of each competitor long before appeared to the ordinary vision, and his knowledge of t

THE SCRATCHMAN.—Mr. J. Summers starting in the Vickers 141 (Rolls-Royce F.11).—(" *Aeroplane* " *photograph.*)

A SPORTSMAN.—Sq. Ldr. the Hon Frederick Guest (right), with his pilot, Mr. E. H. Fielden, at the start of the race.—This picture might be called "Speeding the parting Guest," seeing that Sq. Ldr. Guest parted with the money to provide the machine, and then flew in it.—(*"Aeroplane" photograph.*)

machines and the flying records of the pilots gave colour to the otherwise grey gaps in the morning.

The Club has certainly done a lot towards making Norfolk air-minded, in spite of the local inhabitant who said that he had seen all the machines arrive and depart, but, personally, he would rather walk, if it took him all his life. East Anglia, being essentially chivalrous, nearly everybody hoped "the ladies" would win, presumably all three in a dead-heat for choice.

The first weather report gave the wind at from 20 to 25 miles an hour, with visibility excellent and clouds at 4,000 feet. As the wind was mostly behind them, the competitors made good time between Heston and Norwich, the slowest machine, the H.A.C. 2 Minus (Bristol Cherub III. engine) doing the 119 miles in 72 minutes 20 seconds, and the scratch machine, the Vickers 141 (Rolls-Royce F. XI. engine) doing it in 42 minutes 1 second.

Nearly all the pilots of the low-powered machines complained of the bumpy state of the atmosphere. Some of them had been badly thrown about. Mr. B. E. Lewis and Flt.-Lt. Armour, flying a D.H. Gipsy Moth, had a forced landing between Henlow and Norwich, and was the first casualty after the start. Mr. R. W. Jackson, flying a Simmonds Spartan (Cirrus III. engine), had the bad luck to get an ineffective compass, with the result that he went off his course and lost over half an hour.

Mr. T. N. Stack, flying the Hermes Avian IV. M., got to Norwich in just under 49 minutes. Flt.-Lt. T. Rose brought the S.E. 5A (Airdisco engine) along in 56 minutes 20 seconds, and enlivened the proceedings with an aerobatic climbing turn after crossing the line. Mr. A. H. Wheeler, flying an S.E. 5A (Viper engine), was nearly five minutes faster over the course. Lt.-Col. Strange, in a Simmonds Spartan (Cirrus III. engine), looked strangely unfamiliar, but turned out to be Mr. C. S. Staniland.

Sq.-Ldr. Guest, who was a passenger in the two-seater Gloster Grebe (Jaguar engine), which he had entered for the race, was not very pleased with the Mousehold aerodrome. He thought that the dip into which the machines had to land, because of the direction of the wind, ought to be filled in. Judging by some of the landings made, that dip, in the opinion of the present writer, was the only thing that prevented certain competitors from running straight into the North Sea.

Talking of landings, a candid critic described some of them as "paper-bag" landings, and certainly a good many of them gave rise to the conclusion that the bumps in the air had become a habit. However, the only Norwich casualty was Capt. W. R. Bailey's Gipsy-Moth, which was written off with a broken longeron and other damage, having hit the aerodrome apparently tail-skid first, and with slots wide open. It was towed into a shed, where it was last seen surrounded by Club members wondering whether there was any chance of holding it as a hostage, duly repaired, for their own use.

Considerable interest was shown by the knowledgeable in the new steel airscrew for Moths, made by the Metal Propeller Co., and fitted to Capt. H. H. Balfour's D.H. Moth (Cirrus engine). The new low Gipsy-Moth entered by Sir Charles Wakefield and flown by Mr. Broad was also a centre of admiration. A good name for it might be the Moth "Pull-over."

As early in the race as the Norwich halt great mystery surrounded the identity of "R. Llewellyn," the writer's suggestion that he was "atchually" somebody else was quelled with uproar.

Mr. Summers, flying the Vickers 141 (Rolls-Royce FXI. engine), arrived covered with oil, but apparently his endurance ratio is high, as he left again on time under the same conditions. The speed of the 141 from Heston was 178 m.p.h., and the actual time 41 minutes 54 seconds.

THE CONTROL AT LYMPNE.

Observed by R. Dallas Brett.

Mr. H. R. Law, the Cinque Ports Club's representative in the Race, arrived late at Lympne, owing to having gone to Hunstanton by mistake, and having to return to Norwich. However, he proceeded in spite of the weather and an impossible handicap, and only retired at Blackpool on account of serious magneto trouble. We wish him better luck next year.

The handling of the Lympne control for the race was made exceedingly difficult by the high wind, which necessitated the machines being held down or chocked all the time they were on the ground. It was solely due to the very hard work of the Officers, N.C.O.'s and Airmen of No. 25 (Fighter) Squadron, R.A.F., Hawkinge, who so sportingly volunteered to help the Club Officials, that only one accident occurred, when Mr. Ashworth's Avian was blown over just after landing and broke its propeller, necessitating retirement from the race.

We offer our apologies to any competitor who suffered inconvenience or delay at our control, but we feel sure that all competitors appreciated the very great difficulties under which the control was worked, and we do not actually know of anyone who suffered delay.

We would like also particularly to thank Squadron Leader Payn and his Officers, N.C.O.'s and Airmen for the most sporting way in which they came to our assistance and for the very hard work which they performed so efficiently.

THE BRISTOL CONTROL.

Observed by Major G. S. Cooper, D.S.O.

The event of the week was the halt here in the King's Cup Race. In spite of rough weather we had a good assembly of spectators who constantly had to shelter in their cars—heavy showers intermittently falling all the afternoon.

The first arrival was anxiously awaited and then excitement was well maintained, almost too well perhaps for those controlling the aerodrome!—sometimes three and four machines landing almost at once. Everything however appeared to pass off smoothly, thanks very largely to the organising ability of Mr. C. T. Holmes, and his volunteer staff, and we hope that competitors were satisfied with the arrangements made for them.

The management of the aerodrome was made much easier owing to the ready and able assistance rendered by the R.A.F. who have lately arrived here,—to whom our very grateful thanks.

Over 200 teas were served in the hangar and Club-house, almost entirely run by voluntary work of Club members. The control work of the A.A. was as usual admirable, and the Bristol City Marine Ambulance and the Rev. Mr. Gay and his Boy Scouts gave splendid assistance selling programmes and tea tickets. Our official ambulance, the Bristol City and Marine, under Capt. Tresize was, as ever, ready for any eventuality.

After the departure of the last competitor we threw a typical Bristol "party" in the Club House—this continued until the early hours elsewhere and with some only died an unnatural death about lunch time on Saturday.

AN IMPRESSION AT BLACKPOOL.

Observed by Lester D. Gardner, U.S.A.

These impressions of the King's Cup Race are being written, quite appropriately, on board the Imperial Airways Handley Page *City of Pretoria*. That incessant air traveller Mr. Van Lear Black chartered it so that he and his guests might see the start of the race at Heston, the arrival at Lympne, the finish of the first day's flying at Blackpool, the start and finish of the first day's racing, and do it all with the luxurious comfort that only a well-appointed air liner affords. Air Vice-Marshal Sir Sefton Brancker also flew from Heston to Blackpool in a Moth, not only to act in his official capacity, but to give the occasion a properly cheery tone.

With "true Southern hospitality," as it would be known in Baltimore, where Mr. Black lives when he is not flying to all the far ends of the earth, this correspondent *pro tem.* of THE AEROPLANE was invited to join the party, and is therefore scribbling these lines between luncheon courses en route from Blackpool to Heston. This may be the beginning of a custom which will make writing for THE AEROPLANE so delightful that even C. G. G.'s pen might lose some of its—to coin the only word that occurs at the moment—*caustiferousness*.

It was difficult to leave the monkeys, the midgets, the goose-stepping lion and the thousand other attractions that make Blackpool and Coney Island so similar, and to go out to a mere aerodrome to see another so-called air race—where, as they say in Ireland, the inevitable never happens and the impossible always occurs. But C. G. G. wanted American impressions, and he could not be disappointed, as several years ago he had favoured *Aviation* readers with his amusing ideas of the Dayton air races—and the citizenry of that air-minded city are stinging yet from his caustiferous praise.

Before going to the aerodrome a call should be made on the Lancashire Aero Club, which was celebrating under the watchful eye of Mr. Alan S. Goodfellow. As the hour was midnight, a time when Coney Island would be at the height of its festivities, Blackpool resembled the quiet of the Wall Street district on Sunday night. The similarity to the nights before the races in Baltimore, Los Angeles or Detroit became evident immediately. It resembled Detroit perhaps a little more. There it is so easy to get from Canada that apparently necessary lubricant which all over the world is required to ensure a smooth-running air-meet. The Quiet Birdmen at their zenith have nothing on the hospitality of the Lancashire Aero Club before, during, and "the morning after" an air-race.

When we reached the aerodrome on Friday afternoon and saw only a small group of spectators we received our first shock. Imagine such a lack of interest in Italy, or even in the U.S.A., where we have no gracious King to encourage aviation. My mind naturally recalled the Ford tour, which resembles a flying advertisement for everything under the sun, arriving in, say, Kansas City, Wichita, or even Montreal. The whole populace of these cities would be packed around the field, thousands of motor-cars would be parked near by, the enthusiasm that would greet the leader of the first leg would be tumultuous. The loud-speakers would belch forth to all parts of the field informative comment and no the mournful "one never knows" which was the Blackpool announcer's repetition on almost everything in connection with the events of the afternoon.

To one who had always regarded the King's Cup Race as the blue riband of British Aviation, the complete lack of interest in an amusement (*sic*) centre like Blackpool was depressing. True, the most agreeable and entertaining Lord Mayor was present with the other dignitaries of the city government: but as for the public, one of the Blackpool papers was accurate when it said that the crowd had gone home to tea when the contesting planes arrived. Either such contests will be run only for the air enthusiasts, they will become a Derby or Wimbledon. But, of course, even the officials do not receive any information as to the progress of the race until the aeroplanes arrive, the crowd cannot be expected to come.

So much for the crowd. With the arrival of the plane one American hat went high in recognition of the efficiency of the control of the field. Everything was done perfectly. The racing aeroplanes had a clear field, they were ushered immediately to their appointed place, and the pilots were allowed to disappear to the quiet of a hotel instead of being made the victims of an over-zealous Entertainment Committee of local air modocs who wish to bask in the reflected glory of air heroes.

One noticeable fact was the deference with which the Press and cinema representatives approached their victim. Even the calm Miss Spooner left them flat with the remark "Horrid people you are." Which put us all in our proper place. Evidently the blessings of publicity are not valued as highly in England as in the U.S.A., where pilots of the

gentler sex give their first thought to the Press—often for a handsome consideration.

The complete lack of enthusiasm at the field was not in evidence at the hotel. Led by the amiable Lord Mayor, who gave every evidence of being a true member of the air clan, "a good time was had by one and all," as our small-town U.S. newspapers would say. But as I have heard that THE AEROPLANE is read by some of the best families as well as by aviation people generally, and as it is its policy to draw a veil over any view that might shock some of its readers, perhaps Lord Melbourne's remark will be appropriate: "It doesn't matter what we say so long as we say the same thing."

As a sporting contest the King's Cup Race has been the most productive of results of any air race in the world. Pilots, as well as the development of sport-planes, have been given that impetus which has put British aviation ahead of the world in this field.

The possibilities of using the race to interest the public is best expressed by the prayer of the Scots: "Oh, Lord, keep our minister humble and we will keep him poor."

THE BLACKPOOL CONTROL.

Observed by C. N. Colson.

When the stars are winking down on Blackpool sands,
O-o-h! I want ROMANCE! —*Beachcomber.*

One is tempted to ask, Has "*Beachcomber*" ever been to Blackpool? And, if so, did he go by train? His pseudonym suggests his acquaintance with a possible setting for Romance—sands—beach—comber—roamer—but surely even Boltonians prefer comparative solitude for such matters. Or can it be that they like it *en famille*—or, more correctly, *en masse*?

The stars may twinkle, but I doubt whether their light can penetrate the solid mass of humanity that seems to enjoy the sands until the early hours! And "Beachcomber" resides in London, and one can fairly safely say that all Romance would be bored out of him by the time he reached Blackpool were he to go by train.

Seven or more hours for a journey of roughly 228 miles, or approximately 32½ miles per hour!—in these days, and often no restaurant car on the train, at that!

But probably he copies his eminent rivals, whose "flying photographic studio" *Geraldine* carries its lucky occupants to such places in an easy 2-3 hours, and does not subject them to pushing and crushing or to the unwelcome attentions of other people's sticky infants.

From the above diatribe 'tis obvious where one spent the time during the race for the King's Cup, and also that the journey by train thence may be taken as a cure for anyone whose "air-minded complex" is not yet up to THE AEROPLANE standard.

Actually one left Euston at 6.45 hours (evidently the Editor had never tried to get transport at that time of the mornin when he advised that train!), and arrived at 13.47 hour with one's main fuel tank in a sad state of vacuum. Hov ever, a visit to the Queen's—the Headquarters of the Lai cashire Aero Club during the race—soon remedied this d fect, and one hurried out to Squire's Gate aerodrome.

A varied programme had been arranged to keep the spe tators amused until the arrival of the King's Cup compet tors, and was admirably carried through more or less t schedule. But evidently "Beachcomber's" effort had fire the potential crowd to look for Romance elsewhere, as ther could not have been more than 2,000-3,000 onlookers at an time.

THE END OF THE FIRST DAY.—Mr. Neville Stack, first at Blackpool, being congratulated by Miss Winifred Brown, and Mr. Brown (no relation) of the Lancashire Aero Club.

THE SOCIAL FOCUS.—The Central Building at the Heston Air-Park on King's Cup Day. The Household Brigade Flying Club owned the upper terrace on the right and the middle bay is their club-room.

Digitized by Google

Digitized by Google

Our admirable D.C.A., Sir Sefton Brancker, who is indefatigable, had flown up after seeing the start at Heston in the morning [isn't it high time the Editor took a lead from Sir Sefton, and sanctioned the provision of, say, a Robin for such jobs as these?] and was understood to be going to reverse the procedure after the start on Saturday morning so as to be in again at the kill.

The aerodrome is, like many others, a disused race-course, and except for the very bad furrows which were filled with clinker and stones, and so nearly caused the retirement of the ultimate winner, does not make a bad landing ground.

The grand-stand has been arranged for the club-room and the office of the Lancashire School of Aviation; who, by the way, were doing, as is usual, a steady trade in joy-rides with two of their Avros. It was also the Press stand which, except that it was a trifle far from the actual landing-ground, provided a fine vantage point.

The general enclosure was defined by a barrier right across the main part of the ground, and was large enough to accommodate many tens of thousands.

No doubt the Committee had good reason for their action, but it certainly seemed unnecessary to keep all cars back in a special enclosure and not to allow them to be used as private grand-stands, as is usually done. However, the new Municipal Aerodrome, on what is said to be an ideal site, was announced to be shortly becoming an accomplished fact, so no doubt arrangements there will be up to date.

Loud-speakers were installed, and the services of Mr. Will Hay had been secured as announcer. His inimitable wit greatly enlivened the proceedings.

The attendance of visiting aircraft was distinctly poor, and one gathered that many more than those present had promised attendance. Actually there were only about five Moths and five Avians, consequently the various events lacked much real support.

A successful effort was made to depart from the rather time-worn bombing of a car by having a motor-cyclist instead, and he skilfully rode up and down, while ziz-zagging—*à la* war-time convoys—the whole length of the spectators' barrier. But the bombers' aim was not good, and one thinks they might gain much good advice from those "knights of the flour-bag" who jousted at the last Conington meeting.

The programme became somewhat strung out as time wore on, because the clouds had been piling up and getting blacker and blacker, and no one was surprised when it was announced that heavy weather and head winds had caused an extra hour or more to be added to the probable time of arrival of the first competitor.

Various pilots gave exhibitions of aerobatics as part of a local competition, and Miss Brown showed that she could hold her own in this branch—her loops being particularly neat.

We were treated to the hair-raising spectacle of a supposedly old lady taking off, flying round, and finally landing, despite the protests of the authorities—her identity was not disclosed. One hopes that the episode will not cause friction with Mr. Lamplugh, for one was recently told by a prominent insurance manager that the raising of premiums of all lady car-drivers was being seriously considered, so as to prevent the penalisation of drivers in general in insurance matters! And may be he is following suit.

A pilot then gave a pretty display of aerobatics on Mr. Will Hay's banana machine, as he called it—a Moth with a bright yellow fuselage!

It had previously been announced that Mr. Van Lear Black and party were flying up in an Imperial Airways machine, and now Mr. Hay reported with stentorian voice that the machine G-EBMR, a twin-engined Handley-Page, was actually in sight and had on board (or does one say "in" an aeroplane,) Mr. Van Lear Black—the well-known Dutch millionaire—and party. Mr. Black is the owner of *The Baltimore Sun,* and one wondered whether he appreciated being called a "Flying Dutchman!"

The real business started shortly after this, when Mr. Hay told all and sundry that though he was supposed to be short-sighted—when occasion demanded!—he could see the first machine arriving.

It was a distinctly thrilling moment, as one instinctively thought of the bad weather which had been reported, and as one saw the black speck drawing closer, just skimming the house-tops, flying well below some factory chimneys standing in the distance. One thought of the physical and mental strain of flying full out for some 500 miles through such bumpy weather.

It was soon obvious that it was no amateur coming in, flat out, dead on his right course, and hedge-hopping with perfect judgment. In the few seconds that remained one ran through the various high-powered machines in one's mind, as it was certain that the fast machines would do best in that weather. But this machine did not seem like any of them. Then in a second or so one saw it was an Avian, and No. 49. A yell arose, and the loud-speaker said: "Good old Stack, have you brought your uke?" [Mr. Hay's allusion being to Mr. Stack's pet ukalele, which travels everywhere with him.—ED.] A half-circuit, and a perfect landing, a rush of Press photographers, a few minutes' cheering, and one was eagerly scanning the ominous bank of black clouds for the next arrival.

WINDING UP THE CLOCK.—Putting in the starting-handle of the Vickers 141.

About ten minutes elapsed, then she came—obviously a high-powered machine, this time. Down she dived over the line, then up in a light-hearted Service zoom, and "R. Llewellyn" had arrived in the first Grebe.

But tragedy followed all too quickly. The wind had veered round to the north, and landings had to be made across those furrows already mentioned. Had the machines been directed to land further down the S.E. end of the aerodrome all would have been well, but as it was, there were several deep, stony furrows right across where they came. And as the Grebe came in, necessarily fairly fast, the tail-skid caught up the stones and broke away. Luckily she just slewed round and stopped in such a position as to keep the following machines clear of the danger area.

The second Grebe came along 1½ minutes later, and then machines arrived almost too fast for one to note the times.

Miss Spooner was the first woman in, having gained many places, and once more proving her ability as a pilot. Incidentally it is marvellous how she has recuperated since her accident, for though obviously tired out, she was by no means so "done" as many of the men.

There was much movement in the "Gloster" camp during the night, and the requisite parts were rushed up by road through the dark, arriving about 3 a.m. With the help of certain sportsmen from the Club, who stuck to the job all night, a new skid, rudder, sternpost, and lower fin were fitted, and the Grebe was ready in time to leave next morning.

When it was certain that everyone who was going to arrive had done so, one repaired to G.H.Q. for refuelling.

It was soon obvious that all and sundry had read and thoroughly imbibed "Beachcomber," and had "a year's high spirits that are ripe to burst"—and burst they did!

Talent was soon forthcoming, both vocal and instrumental, and the inimitable and only Stack obliged with delightful renderings of "The Persian Kitten," "Something better than Love," etc. Others, whose names one was unable to get, sang and showed versatility on the piano, and provided together a very cheery evening.

As the first man was due away at 8.00 hours next morning everyone was up betimes to do their share of marshalling, and so forth.

Mr. Staniland was the first man away, in his Spartan, and was followed by the others without hitch.

Much relief was expressed that "R. Llewellyn's" Grebe was O.K., and he had an especial cheer when he left, from those few spectators who had arrived.

Four more retired, Flt.-Lieut. Bruce, V. N. Dickinson, H. R. Law, F. O. Wheeler—who felt, as they put it, "they hadn't an earthly," and so mostly flew straight down to Heston to see the finish.

Finally, Mr. Summers took off the Vickers 141, 3 hours 1 minutes after Mr. Staniland, and rapidly roared away out of sight, and so ended Blackpool's part in the race.

THE GLASGOW CONTROL.
Observed by John Talbot.

As a mere refuelling station Glasgow had not the pleasure of entertaining overnight the competitors in this year's King's Cup Race. In spite of this, however, the Scottish Flying Club took advantage of the circumstances to stage an all-day flying programme at Moorpark Aerodrome, and the public turned up in such numbers as to beat all previous records, and unfortunately to show glaring weaknesses in the official organisation.

As to the race itself, competitors arrived, taxied out of sight of everybody for filling up, and departed to schedule with monotonous regularity, almost without incident. The wind was unfortunately in the worst possible direction, giving a short, uneven width of the aerodrome for landing and taking off. The two Grebes and the new Vickers 141 were, however, the only machines to have difficulty in alighting, Mr. Summers trying three directions before finally making a perfect landing.

With the departure of the back-marker, the rapidly increasing crowd settled down to see our own local pilots "do their stuff."

The proceedings were opened with an aerobatic display by a club member, Mr. George Yuill, whose polished show was only marred by the fact that he performed in quite the wrong quarter of the sky for comfortable observation. Thereafter we had the usual bombing—this time a wedding party which was bombed in handfuls by the disappointed suitor; a height-guessing competition; wing walking (by the Berkshire Aviation Tours, Ltd.), and a club race for a Cup presented by "Mobiloil" proprietors. The programme as printed was rapidly reduced to chaos, time became a matter of no importance, and several items were missed out entirely for no apparent reason.

The star event was a delayed drop parachute descent by Mr. Tranum, but as he "took off" from only about 1,200 feet, the "delay" was not very noticeable.

One hates to criticise adversely a young and flourishing body of enthusiastics, but one feels sure that the Scottish Flying Club *can* and *will* do better in the future, and that they will receive such criticism in this spirit.

The public enclosure consisted underfoot of unrolled road metal, while the car park resembled nothing so much as a builder's yard.

The closest ground view obtainable of any of the Cup machines or pilots was about 500 yards, and in fact the competitors were never seen out of their respective cockpits for the reason already stated at the beginning of these notes.

THE MATRIMONIAL MOTH.—Mr. and Mrs. J. W. P. Chalmers after finishing.

THE FIRST FEMININE FINISHER.—Miss Winifred Spooner, after coming in fifth.

The best view of all the day's events was obtained by t many thousands of hedge-crashers who lined the east ed of the aerodrome—while, conversely, the already bli hangar-side road was carefully screened by canvas.

To a certain extent one's sympathies go out to the sec tary and his committee who, having provided a rabbit hut were presented with a herd of elephants.

BEFORE THE FINISH.
Observed by C. G. G.

Heston Air Park on July 6 looked very like what Londo fashionable aerodrome should look like on a King's C day. The crowd in the reserved enclosure were the be looking lot one has ever seen at an aviation meeting.

One learned that the Air Park Secretariat, which consi chiefly of Miss Slade, herself a pilot of considerable abil who has her own Moth, had invited the whole of the Ho of Commons as guests,—to teach them something ab aviation. Whether many of them were there seems dou ful,—they could not have been such good-lookers. Perh they gave away their invitation tickets to their really r relations. Actually the crowd was very much more like Ascot crowd in sports clothes than an ordinary flying-c or aerodrome crowd,—and people of that sort are th whom we want to interest themselves in aviation.

Probably the quality of the crowd was helped a good by the fact that the Household Brigade Flying Club adopted Heston as its home aerodrome and has also stalled itself in the best room in the Social Focus as its club premises. But be that as it may, if the lads and la of the village and their thoroughly nice elderly relati whom they had obviously dragged to Heston, either buy a planes themselves or persuade the said relatives to them, Aviation is obviously going to be the done th within the next 12 months.

And when it is, not only shall we have to thank He Air Park largely for the new development, but the prietors of Heston Air Park will profit very handsomely the new fashion.

For the first time in the history of Aviation the r people were taking an interest in an air race,—which very right and proper seeing that the attraction was race for the King's Cup. Fortunately Fate and Mr. Da and his assistant Mr. Rowarth, provided a really exc finish. And anybody who was there for the first time have gone away with the idea that even long-distanc racing is thoroughly exciting sport.

"Bristol"

BULLDOG

ALL METAL
SINGLE SEATER
FIGHTER

The following is an extract from a well-known test pilot's report upon the machine.

"..The performance is something to enjoy and wonder at. When fully loaded the climb to 20,000 feet takes only thirteen minutes, while the speed at that height is 165 m.p.h. A normal cruising speed of 130 m.p.h. can be maintained without in any way over-running the engine. If the pilot is one to whom stunting appeals, the Bulldog will prove his ideal machine. The metal structure with its very high factor, ensures absolute rigidity under all manœuvres, while when diving at a maximum speed of 270 m.p.h. the machine is just as steady as when cruising at 130 m.p.h. There is no tendency to flutter, and the longest spin is immediately stopped by the normal use of the controls. All normal aerobatics are within the power of this machine and it has actually completed inverted loops after being dived at speeds over 200 m.p.h., a fact which illustrates more clearly than most the exceptional strength of this aircraft.

A Sporting Event.

By way of keeping things going while the crowd was arriving, and before the King's Cup competitors arrived, the Household Brigade Flying Club held a landing competition for the Gwynn Madocks Cup, a trophy presented in the finest sporting spirit by the parents of the late Mr. Gwynn Madocks of the Coldstream Guards,—who was killed at Brooklands just before the opening of the club's first meeting.

The cup was won by Mr. Robert Quilter, late Grenadier Guards, with full marks for style, approach and landing. His actual landing was 8 inches from the target, or mark. The second was Mr. E. Somerset, Coldstream Guards, with 92 marks, 8 yards from the target. The third was Mr. A. V. C. Douglas, Scots Guards, 44 yards.

The also-landed were Mr. E. L. Donner, Irish Guards, 58 yards, Mr. R. L. Preston, Coldstream Guards, 105 yards, Capt. T. Rhodes, late Grenadier Guards, 130 yards, and Mr. W. R. West, Grenadier Guards, 142 yards,—for which he was given only 29 marks.

After that there was a variety of other flying, and sundry visitors arrived. Mr. Van Lear Black and some friends, including Mr. Lester D. Gardner, the founder and until lately the proprietor of *Aviation*, New York, the leading American aviation paper, arrived from Blackpool.

Sir Sefton Brancker, still piloted by Flt. Lt. Jones, also arrived from Blackpool in the coupé Moth,—the official G-EDCA Moth being laid up for repairs,—and confessed himself converted to travelling in a coupé though he has always stood out for open machines.

The Official Opening.

Then Lord Thomson, our alternative Secretary of State for Air, arrived from no stated point of origin, in a London Aeroplane Club Moth, piloted by Major Travers, the Club's chief instructor,—who remarked that he hoped that his wheels had stopped spinning when he landed.

Thereafter Lord Thomson hied himself to the microphone of the loud speaker and in a few of his usual well-chosen words declared the aerodrome officially opened and wished it long life and prosperity. Mr. Nigel Norman, replacing Lord Thomson at the microphone, said how much honoured he and his partner Mr. Muntz were to have their aerodrome opened by the Secretary of State for Air, and promised a hearty welcome to all good aviators and fealty and allegiance to the Air Ministry and all its regulations.

And then the Chairman of the local Urban District Council, including Beaversfield, said how happy they were to have this new Social Centre established in their midst. And so everybody was pleased.

When these ceremonies were over the loud speakers announced that the leading competitors had left Birmingham,—with Mr. Stack well ahead pursued by Lieut. Richardson, R.N., Mr. Atcherley, Mr. Fielden and the leaders of the Moth Brigade.

THE FINISH.

Just about when the winner ought to have been coming in, a cloud which looked very like a rain-storm blew along from the direction in which they were expected. The worst of it blew over before the first machine appeared. To everybody's surprise, instead of Mr. Stack's Avian the leader showed up as a Grebe,—obviously Mr. Atcherley's.

A few seconds after it a light aeroplane was spotted and people began to think that the Grebe had caught the Avian in the last mile of the course. But instead of the aluminium with a black nose of Mr. Stack's machine this showed up as black all over with a white deck, and was recognised as Lieut. Richardson's Moth,—whereat there was great jubilation among private owners at seeing one of their own number putting up such a good show and getting second place in the big race besides winning the coveted Siddeley Trophy.

Hardly had the winner and the second machine landed before two more light aeroplanes showed up close together. The bright scarlet of the leader announced him as Mr. Hope and the beige with the red stripe of the next machine showed it as Mr. Alan Butler's.

Here one recommends to owners the use of a distinctive colour scheme. All these machines could be recognised by their own colours long before anybody could pick out the racing numbers on their tails or the registration lettering on their sides.

A Sporting Effort.

After Mr. Butler had landed there was a gap, and then Miss Spooner's Moth appeared. As usual, she had put up a magnificent show. With a standard machine merely streamlined a bit for the occasion she had averaged over 105 miles an hour, which was the fastest speed of any of the light aeroplanes except those which were deliberately made into racing machines for the occasion.

Unfortunately, this time Miss Spooner gets nothing for her trouble, because the Siddeley Trophy, plus £75 presented by Mr. Alan Butler, goes to Lieut. Richardson, and the second prize of £25 from Mr. Butler goes to Mr. Lawrence Hope. And if there had been a third prize in the Siddeley Trophy Race Mr. Butler would have won it himself.

A Tale of Woe.

The sixth arrival was Mr. Stack. As he came in to land over the crowd his engine could be heard firing obviously only on three cylinders, if that. After he had landed he

THE FIRST SHOWING

IN GREAT BRITAIN OF THE

FORD TRI-MOTORED ALL-METAL TRANSPORT

WILL BE AT THE

INTERNATIONAL AERO EXHIBITION AT OLYMPIA

As a prominent example of American aircraft built solely for commercial work, the Ford tri-motored, all-metal transport monoplane offers much of interest.

It is designed to seat fourteen passengers in addition to crew of two and to give the general excellence of performance, stability and maneuverability needed in commercial flying — as contrasted with military requirements which accentuate one feature at the expense of others. Its high speed is 135 miles an hour; cruising speed 115 miles an hour; landing speed 60 miles an hour. Its service ceiling is eighteen thousand feet. Its weight light is 7600 lbs.; all up weight, 13,500 lbs. The disposable load is 5900 lbs. The radius of action, five to six hours.

The entire structure and covering of the Ford plane is metal, all exposed surfaces being "Alclad" alloy which is non-corroding. Aside from the obvious advantage of freedom from rotting, splitting, tearing, and warping, all-metal construction assures the perfect fit of all replacement parts, and its strength may be pre-determined with accuracy.

The power is provided by three Pratt & Whitney radial Wasp engines of 425 horse-power each. The Ford plane will fly and climb, with full load, on any two of its engines.

Independently operated hydraulic brakes on the wheels and the tail wheel instead of the skid provide motor-car control of the plane on the ground, and remove any need for a handling crew either while taxi-ing or testing the engines.

Ford planes are operating in regularly scheduled transport service over thousands of miles of airways in North, Central and South America. While accurate figures are not obtainable, we believe there are more Ford planes being used in the Western Hemisphere than all other tri-engined transports combined.

The price of the various models of Ford tri-motored transports, at Dearborn, Michigan, U.S.A., ranges from £8670 to £11,355.

CROSSING THE LINE.—The winner arriving.
—(" *Aeroplane* " *photograph.*)

THE WINNING CREW.—Mr. R. L. R. Atcherley (left) and Flt. Lt. G. H. Stainforth.—(" *Aeroplane* " *photograph.*)

explained that something went wrong in the engine after leaving Birmingham,—where he had an easy ten or fifteen minutes in hand if he had only maintained his speed round the rest of the course. Which shows that the handicappers were not so very far out in their estimates of his machine and engine, and were in fact not in the least optimistic.

The first thing he noticed after the obvious cutting out of one cylinder was that his oil pressure went down, and the engine began throwing out clouds of oil. Consequently he made for the R.A.F. Aerodrome at Bicester,—which was only a trifle off the course. There he landed and prayed for oil.

A very willing airman explained what Mr. Stack knew perfectly well, of course, that he could only get oil from R.A.F. store with a written permit from the Orderly Officer of the day. So the Orderly Officer had to be found by telephone from the aerodrome to the station office. And by the time he had arrived and given the necessary order and the oil had been put into the machine, thirty-five minutes had passed, and Mr. Stack had lost the race. If he had been able to get the oil in ten minutes instead of thirty-five he would just have won.

The odd twenty-five minutes was nobody's fault. Aviators cannot expect to drift down into a Service aerodrome and be supplied with oil for cash across the counter any more than a passing motorist can expect to pull up at a Roy Army Service Corps Mechanical Transport Repair Depot ar have a mechanical repair made on the instant. At a small Service aerodrome with a single squadron possibly tl twenty-five minutes might have been saved. But such a the fortunes of war and racing.

A.D.C. Aircraft Ltd. have very sensibly issued a full e planation of why the Hermes broke down. That is so muc better than hushing it up and pretending that it was nothir but bad luck. As a matter of fact, it *was* bad luck, and tl Hermes put up an extraordinarily fine show considering th it was its first public appearance.

Anyhow, Mr. Stack got £50 for being first at Blackpoc which is more than most of the people got who stood gallantly such a hammering all the way round the course.

Just after Mr. Stack the other Grebe arrived, and M Fielden explained that within a few miles of Birminghar when they were close behind Mr. Atcherley, they broke flying wire and had to go easy as far as the control. Thei they fitted a spare flying wire which they were carryin and so finished the race. Which only shows how extraord narily silly it is to have a machine with flying wires

HISTORICAL MOMENTS, I.—Harold of England meets the Conqueror.—Mr. Atcherley and Flt. Lt. Stainforth in the winning Grebe are met by Mr. Harold Perrin, Secretary of the Royal Aero Club.

Digitized by Google

break when aeroplanes can perfectly well be built without any wires at all.

The eighth machine was Flt. Lt. Trench's Avian (Cirrus III). The ninth was Capt. de Havilland's Gipsy-Moth. The tenth was Mr. J. D. Irving's Gipsy-Moth, and the eleventh was Mr. Jackaman's Gipsy-Moth, all close together and all practically off the same mark at the start, showing how very little there is in it between the speeds of the standard machines.

The twelfth machine to finish was Mr. Thorne's Avian (Cirrus II).

The thirteenth was Mr. "Woolworth," who explained with something like pride that a standard Widgeon will maintain 90 m.p.h. air-speed on four cylinders of a Genet engine. He had broken a rocker-arm leaving Bristol and had flown the whole way to Blackpool on four cylinders at that air-speed.

The fourteenth to finish was Mrs. Butler, and the fifteenth was Wing Cdr. Manning. The sixteenth was Mr. Schreiber and Flt. Lt. Bonham-Carter,—who saved their insurance after all.

The seventeenth machine was that of Mr. and Mrs. Chalmers, who, considering that they are absolute amateurs, had put up an astonishingly fine show in going through with the race after having such a knocking about on the first day. The eighteenth was Mr. Wallace, another private owner in a Gipsy-Moth.

The nineteenth was Mr. P. P. Grey in Mr. Ingram's Gipsy-Moth. And the twentieth was number 20, Mr. Broad, in the "pull-over" Moth entered by Sir Charles Wakefield.

AN UNPLEASANT ADVENTURE.

As the table on page 76 shows, there was only a small fraction of a mile an hour difference between Mr. Broad and Mr. Alan Butler on the first day of the race. But on the second day after crossing the Cheviots from the Glasgow side Mr. Broad ran into a heavy storm somewhere between Wooler and Alnwick. Knowing that he had high ground in front of him and being able to see nothing through the storm he was forced to land,—apparently quite near Chillingham Castle, the home of Lord Ossulston, an enthusiastic Moth owner and pilot.

A friendly farmer found him and gave him lunch, and discussed cattle and crops and sheep with him, what time Mr. Broad, knowing that he was by now out of the race, resigned himself to paddling home at his own speed, when the weather cleared. He came to the conclusion that Alnwick beer was good and that the life of a shepherd at £2 10s. a week with a free cottage and a free garden and various other free products of the earth was not at all to be despised after our strenuous existence,—and especially after the bumping he had had all through the previous day.

After Mr. Broad came Lady Bailey in her Coupé-Moth, and last of all Lieut. Kimmins, R.N., in Mr. Tiark's Moth.

The last twelve to finish knew perfectly well that they were out of the race in any case and merely finished out of sheer sportsmanship. So they deserve every credit for seeing the race through.

THE SIDDELEY TROPHY WINNER.—Lt. Richardson, R.N., receiving the trophy from Lord Thomson.
—("Aeroplane" photograph.)

THOSE WHO FELL OUT BY THE WAY.

Of those who did not finish Flt. Lt. Ashton stopped at Hamble and Mr. Leech stopped at Lympne because obviously their machines were too under-powered to get through to Blackpool in such awful weather.

Here the statement may be made that though there was a whole gale blowing on Friday the weather was beautifully clear and nowhere round the course was there any need for navigation, as such. Course-keeping was merely a matter of map-reading, except once or twice when pilots met sudden violent storms such as that which brought Mr. Broad down,—and then navigation would not have helped in any case.

After he left Blackpool nothing was heard of Mr. Staniland till next day, when word came that he had landed somewhere near Hamilton. Mr. Ashworth upset at Lympne. Mr. Dickinson started from Blackpool but returned with some form of trouble. Capt. Harold Balfour retired at Hornchurch on the outward journey. Flt. Lt. Bruce retired at Blackpool as he was then eighteenth and obviously out of the race. Mr. Boyes landed somewhere about Lydney in the Forest of Dean on the way between Bristol and Blackpool with engine trouble.

HOME AGAIN.—Mrs. Alan Butler greets Mr. Butler on landing. Mr. Reeves is in the front seat.
—("Aeroplane" photograph.)

Digitized by Google

Mr. H. R. Law retired at Blackpool with magneto trouble. His opinion and that of his partner, Mr. MacDonald, on magnetos, is well worth hearing. One recommends that they be asked to lecture to some of the manufacturers of magnuisances, as dear old Cody used to call them. Apparently much of the so-called "engine trouble" in the race was magneto trouble of one sort or another.

Mr. Jackson retired with engine trouble at Ipswich. Colonel Sempill came down somewhere between Leeds and Birmingham, and all one knows is that he informed the World at large from 2LO that his machine would have to be got out of its landing place by mechanical transport and not by air power. Mr. Cazalet was forced to land near Hamble.

Mr. Lewis and Flt. Lt. Armour returned to Heston not very long after the start, reporting that they found a whole rabbit, *with* his fur, in the petrol tank. Which being interpreted means that they suffered from a choked jet in their carburettor full of that inexplicable fur which somehow grows in petrol tanks and finds its way through the best of filters. Flt. Lt. Armour's explanation, which seems reasonable, was that they must have filled up through a new chamois-leather instead of an old one which had been thoroughly washed.

Capt. Bailey broke his undercarriage landing at Norwich and retired. Mr. Brunton landed somewhere near Harrow, through some cause unexplained. Mr. Napier retired at Hamble. Flt. Lt. Rose found his oil supply disappearing somewhere between Sittingbourne and Maidstone, and sat his machine on the Downs where he left it tied to a hay-stack. Mr. Wheeler, in the Duke of Northumberland's S.E.5a, stopped at Blackpool. And that seems to account for the lot.

Indications of Progress.

On the whole the race was an extraordinarily good show. The three faked Moths, that is to say faked in the sense that the machines were cleaned-up to give extra speed and the engines were tuned up to give extra power, together with Mr. Stack's equally cleaned-up Avian with the Hermes engine, gave some idea of what ought to be got out of any aircraft designed according to advanced ideas, with similar power, in these days.

Apart from those machines the standard Gipsy-Moths and Avians put up quite a good show, but comparison with speeds of winning machines and fastest times in previous years indicate that we have made remarkably little progress since the first King's Cup Race in 1922.

For the rest, the entries were purely pathetic. The King's Cup is open for anybody to win with a British machine and a British engine. To see people entering ancient things like Grebes and S.E.5as would be funny if it were not so tragic.

Surely to goodness there must be somewhere in this bright little island of ours some manufacturer with enough loyalty or patriotism or common business sense to see that he ought to put up a really high-speed all-British aircraft for this race.

Even in the poverty-stricken years before the War firms which used to wonder where they could buy their next turnbuckle used to sit down and solemnly contrive real speed machines to compete for the Aerial Derby round London, long before His Majesty honoured Aviation by graciously presenting a Cup to be won, so to speak, from his own hands.

If the wealth of the British Aircraft Industry, which is spending its tens of thousands of pounds on showing its machines at Olympia, cannot put up a decent speed show in a race for the King's Cup then it is quite time that somebody in all due humility suggested to His Majesty that in future the race should be made International. Then free and independent Republics like the United States and France, with their deep attachment for anything which is closely associated with Royalty, would probably send over a few machines to show us how to fly.

So far as the management of the race was concerned it was excellent. Mr. Harold Perrin deserves every congratulation on the way in which the whole race was organised. For weeks before he had been going round the various clubs arranging for adequate officials at the turning points and for proper transmission of information from those points. And on the whole everything worked wonderfully.

The people at the Heston Airpark, whom Mr. Perrin had backed against the opinions of a good many people to get the place ready for the race in time, excelled themselves. Without exactly making a garden out of a wilderness, they had certainly made a very good aerodrome establishment out of a brick-heap within a few weeks, and had made farms and garden allotments into a very good aerodrome within a few months.

On the whole the Royal Aero Club is for once to be congratulated on having done a thing thoroughly well, and purely as an expression of personal opinion one believes that the Heston Airpark is going to be the real Social Focus of Sporting Aviation in the future.—C. G. G.

THE KING'S MESSAGE.

The following telegram of congratulations to the winner was received from Buckingham Palace:—

"To Secretary, Royal Aero Club, Heston Air Park, Hounslow.—Please convey to Flight-Lieutenant Atcherley the King's hearty congratulations on winning the King's Cup Air Race.—Private Secretary."

THE PRIZE-WINNERS.

King's Cup and £250 presented by Sir Charles Wakefield to the entrant of the winning machine: Sir Walter Preston, M.P. (pilot, Mr. R. L. R. Atcherley, R.A.F.). Second prize, £100 presented also by Sir Charles Wakefield: Lieut. L. G. Richardson, R.N., entrant and pilot. Third prize, £50, presented by Sir Charles Wakefield: Mr. W. L. Hope, owner and pilot.

Special prize of £100 presented by Sir Charles Wakefield to entrant of the aircraft completing the course in the fastest time: Sir Walter Preston, Gloster Grebe.

First machine at Blackpool, prize of £50 presented by Councillor F. W. Millington, of Blackpool: Mr. T. Neville Stack, Avian (Hermes).

Siddeley Trophy presented by Mr. J. D. Siddeley for competition among the light aeroplane clubs, and £75 presented by Mr. Alan S. Butler: Lieut. Richardson, R.N. Second prize, £25, also presented by Mr. Butler: Mr. W. L. Hope.

THE HAROLDISATOR AT HESTON.

Mr. Harold Perrin wishes it to be known that anyone who held winning tickets for the Royal Aero Club's Totalisator for the King's Cup Race, who has not yet drawn a dividend

AFTER THE BATTLE.—The tarmac and aerodrome viewed from the upper terrace of the Social Focus at the Heston Air-Park.

Digitized by Google

Digitized by Google

can do so by applying to him at the Royal Aero Club, 3, Clifford Street, W.1.

A five shilling ticket for the winner returned a dividend of £3 4s. which is very much better odds than those offered by bookmakers at previous races.—G. D.

MOTH SERVICE IN THE KING'S CUP RACE.

The arrangements made by the De Havilland Company at the King's Cup Race to "service" the Moths and the Gipsy engines taking part in the race, was even more complete this year than it was last year.

There were 16 Gipsy Moths and 5 Cirrus Moths competing in the race, besides an Avian and a Widgeon fitted with Gipsy engines. Additional to the De Havilland personnel with complete service equipment at every control, two roving service machines were in action over the Course with bits of Moth and Gipsy tied all over them, in the manner of the armament of war-time B.Es. Fortunately these machines had very little work to do, as the Moths and Gipsys in practice required practically no service whatever. The two service machines were a D.H.9J, G-EAAC, which was flown completely round the course by Mr. C. A. Pike, and the other was a Moth G-EBTD, flown by Mr. Tyler.

G-EAAC is now something of a historic machine, being the third machine ever registered when Civil Aviation began in this Country after the War, and is the oldest civil relic in existence.

It was used for many years by Mr. Alan Cobham as an air taxi and was actually flown by him in the first race for the King's Cup. It has on occasion been crashed and rebuilt and a few years ago it was fitted with an Armstrong Siddeley Jaguar engine in place of the original Puma, and taken over by the De Havilland School of Flying. [It ought to just about win the King's Cup next year, or at any rate do fastest time, if one may judge by the table of fastest times published in this issue.—C. G. G.]

G-EBTD is the Gipsy Moth which is now doing the Reliability Test, and previous to the Race, had already done 475 hours with its engine completely sealed by the A.I.D.

Pilots who flew Moths, or had Gipsy engines, testify to the completeness of the D.H. Service arrangements, and wherever they were, either at a control or on the various legs of the Course, they were hardly ever out of the influence of the De Havilland Service Arrangements.—G. D.

AEROPLANE PHOTOGRAPHS.

Copies of Aeroplane Photographs (indicated as such in the inscriptions under the pictures) may be had from:—THE AEROPLANE Office, 175, Piccadilly, London, W.1. Single prints 6 in. × 8 in., cost 2s. 6d. each, and 1s. 6d. per print for three or more. Larger sizes or larger quantities may be had at special prices.

HERE IT IS!

THE DESOUTTER 3 SEATER SPORTS COUPÉ

20 YEARS' EXPERIENCE BUILT IT.

SALOON COMFORT FOR PILOT & TWO PASSENGERS

The ideal light plane. Comfortable cabin accommodation for 3 people. A cruising speed of 86 m.p.h., perfect visibility for everyone. In no other plane but the D.A.C. can you get such performance and comfort at the price. It costs very little more to buy, and less to maintain, than an ordinary two-seater light plane, but how much more pleasurable for three to fly in the comfort of a fully enclosed cabin. Write for fuller particulars of this *unique light plane.*

We have adopted the Cirrus Mark III and Cirrus "Hermes" engines as standard for the D.A.C. Sports Coupe. This, in itself, is sufficient guarantee as regards the power plant.

THE ROYAL AIR FORCE.

The London Gazette.

July 2.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following Plt. Offs. are promoted to the rank of Flg. Off.:—O. G. Williams (Jan. 18); D. Menzies, J. D. Richardson, H. G. Hamilton (June 9); H. H. Leech, J. E. Allen, E. J. Hill (June 17); M. Lowe (June 30). The following Plt. Offs. on probation are confirmed in rank:—R. A. Chignell, C. Stephenson (Dec. 13, 1928); H. Bailey, V. S. Bowling, N. W. Creasy, E. D. Elliott, J. H. T. Simpson, W. R. Tope, L. E. A. Wright (Dec. 30, 1928); A. F. Britton (Jan. 21); J. B. Fyfe (April 30); G. C. Butler, C. W. F. Carter, D. B. McGill (May 9); F. A. R. Bishop (May 17); R. L. Bennet, A. K. H. Binley, J. H. Brown, F. C. E. Hayter, J. M. Israel, G. W. J. Jarrett, I. M. Smith, W. G. Stevenson (June 29).

Group Capt. P. F. M. Fellowes, D.S.O., Air Aide-de-Camp to the King, ceases to be seconded for duty as Director of Airship Development, Royal Airship Works, Cardington, with effect from July 1, 1929.

Flt. Lt. J. M. J. C. J. I. Rock de Bescombes is placed on the half-list, scale A (June 8). The following Flg. Offs. are transferred to the Reserve:—CLASS A.—C. Clarkson, I. W. C. Mackenzie, R. H. Holmes, W. L. McLaren, C. R. Cubitt, W. F. Parkinson (June 30); B. W. Barton (July 3). CLASS C.—A. L. Ottway (June 30).

STORES BRANCH.—The following Flg. Offs. are granted perm. comns. in this rank with effect from April 28, 1928, on completion of probationary service:—R. N. Hesketh, B. G. Pool.

ACCOUNTANT BRANCH.—Plt. Off. on probation T. C. Reep is confirmed in rank and promoted to the rank of Flg. Off. (June 11).

MEDICAL BRANCH.—A. C. Lysaght is granted a S.S. comn. as a Flg. Off. for a period of three years on the active list with effect from June 11 and with seniority of June 11, 1928.

RESERVE OF AIR FORCE OFFICRS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class AA (ii) as Plt. Offs. on probation:—A. C. Buck, C. P. S. Smith (June 20). Plt. Off. C. R. S. Smith is promoted to the rank of Flg. Off. (June 13). The following Plt. Offs. on probation of the Special Reserve are confirmed in rank:—J. F. Bristow (Sept. 8, 1928); R. C. Newton (Dec. 31, 1928).

Flt. Lt. A. J. G. Anderson is transferred from Class B to Class C (July 1); Flg. Off. J. M. S. Taylor is transferred from Class A to Class C (June 8). The following Flg. Offs. relinquish their comns. on completion of service:—E. K. Clifford (June 27); G. C. Sclater, A. L. Harris (June 28).

Flg. Off. F. A. Pumphrey, D.C.M., relinquishes his comn. on account of ill-health and is permitted to retain his rank (July 3).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 600 CITY OF LONDON (BOMBING) SQDN.—The following Plt. Offs. to be Flg. Offs.:—E. J. Earnshaw (July 25, 1928); P. G. Stewart (Sept. 1, 1928).

No. 601 COUNTY OF LONDON (BOMBING) SQDN.—The following to be Plt. Off.:—N. R. W. Seely (April 9).

No. 602 CITY OF GLASGOW (BOMBING) SQDN.—The following to be Plt. Off.:—D. L. Lloyd (April 21).

No. 605 COUNTY OF WARWICK (BOMBING) SQDN.—The following to be Plt. Off.:—J. M. Abell (May 14).

PRINCESS MARY'S R.A.F. NURSING SERVICE.

Matron Miss Muriel B. Botwood is placed on the retired list at her own request (June 28).

The Half-Yearly Promotion List.

The following promotions are made with effect from July 1:—

GENERAL DUTIES BRANCH.

AIR VICE-MARSHALS TO BE AIR MARSHALS.—Sir E. L. Ellington, K.C.B., C.M.G., C.B.E.; Sir W. G. H. Salmond, K.C.B., K.C.M.G., D.S.O.

AIR COMMODORES TO BE AIR VICE-MARSHALS.—R. H. Clark-Hall, C.M.G., D.S.O.; A. E. Borton, C.B., C.M.G., D.S.O., A.F.C.

GROUP CAPTAINS TO BE AIR COMMODORES.—P. F. M. Fellowes, D.S.O., Air Aide-de-Camp to the King; P. B. Joubert de la Ferté, C.M.G., D.S.O.; R. P. Mills, M.C., A.F.C.; W. R. Freeman, D.S.O., M.C.; W. G. S. Mitchell, C.B.E., D.S.O., M.C., A.F.C.

WING COMMANDERS TO BE GROUP CAPTAINS.—G. I. Carmichael, D.S.O., A.F.C.; M. Spicer; I. G. V. Fowler, A.F.C.; G. P. Grenfell, D.S.O.; R. J. Bone, C.B.E., D.S.O.; S. Smith, D.S.O., A.F.C.; J. E. A. Baldwin D.S.O., O.B.E.; F. E. T. Hewlett, D.S.O., O.B.E.; C. H. K. Edmonds D.S.O., O.B.E.; R. E. C. Peirse, D.S.O., A.F.C.; H. R. Nicholl, C.B.E.

SQUADRON LEADERS TO BE WING COMMANDERS.—C. H. Nichols, D.F.C A.F.C.; J. C. P. Wood; G. S. M. Insall, V.C., M.C.; G. W. Robart M.C.; D. G. Donald, D.F.C., A.F.C.; N. C. Spratt, O.B.E.; R. M Bayley, D.F.C.; W. B. Hargrave, O.B.E.; L. T. Lloyd; R. Collishav D.S.O., O.B.E., D.S.C., D.F.C.; C. O. Modin, D.S.C.; Sir C. J. (Brand, K.B.E., D.S.O., M.C., D.F.C.; N. H. Bottomley, A.F.C.; H. (Smart, O.B.E., D.F.C., A.F.C.; F. P. Don; A. H. Peck, D.S.O., M.C G. C. Bailey, D.S.O.

FLIGHT LIEUTENANTS TO BE SQUADRON LEADERS.—A. P. Sanders; T. P. Moore; P. D. Robertson, A.M.; E. F. Turner.

FLYING OFFICERS TO BE FLIGHT LIEUTENANTS.—F. Porter; D. Mitchell, M.B.E.; W. H. Jinman, M.B.E.

LIEUTENANTS, R.N., FLYING OFFICERS, R.A.F., TO BE FLIG LIEUTENANTS.—R. A. Peyton; A. P. Colthurst.

CAPTAIN, R.M., FLYING OFFICER, R.A.F., TO BE FLIGHT LIEUTENANT A. B. Woodhall.

STORES BRANCH.

SQUADRON LEADER TO BE WING COMMANDER.—J. A. Stone.

FLIGHT LIEUTENANT TO BE SQUADRON LEADER.—E. Meynell, D.C.M.

FLYING OFFICERS TO BE FLIGHT LIEUTENANTS.—E. C. Farman; H. Slei F. W. Taylor; R. T. Rich; J. E. Truss, M.C.; A. E. F. McCreary; G. Wilson; F. C. Griffin; A. J. Cox, M.B.E.; E. N. D. Worsley.

ACCOUNTANT BRANCH.

SQUADRON LEADER TO BE WING COMMANDER.—H. F. Fuller.

FLIGHT LIEUTENANTS TO BE SQUADRON LEADERS.—J. S. Griffiths; P Farmer.

FLYING OFFICERS TO BE FLIGHT LIEUTENANTS.—J. L. Armstrong; B. Drake; E. C. Green; F. M. Hall; J. H. S. Richards; R. T. Car J Charles.

MEDICAL BRANCH.

GROUP CAPTAIN TO BE AIR COMMODORE.—J. McIntyre, M.C., M M.A.

WING COMMANDER TO BE GROUP CAPTAIN.—James MacGregor, M M.D.

SQUADRON LEADER TO BE WING COMMANDER.—Percival Maurice Ke D.P.H.

FLIGHT LIEUTENANTS TO BE SQUADRON LEADERS.—John Kerr Ri Landells, M.B.; Edward Demetrius Dalziel Dickson, M.B., F.R.C.S D.L.O.

FLIGHT LIEUTENANT TO BE HONORARY SQUADRON LEADER.—Ernest E Isaac.

RESCUED.—The Spanish Dornier Wal flying-boat "Numancia," M-MWAP, on the deck of H.M.S. "Eagle" after she was rescued with her crew in the Atlantic.

PRINCESS MARY'S ROYAL AIR FORCE NURSING SERVICE.

SENIOR SISTER TO BE MATRON.—Miss Winifred Eveline Molesworth (Acting Matron).

Appointments.

Week ending July 8.

GENERAL DUTIES BRANCH.—Flight Lieutenants B. A. Malet, D.F.C., to E. and W. School, Flowerdown, 7/6. F. G. S. Mitchell, to No. 1 F.T.S., Netheravon, 3/7.

Flying Officers A. H. W. J. Cocks, to E. and W. School, Flowerdown, 1/6. I. J. Fitch, to E. and W. School, Flowerdown, 25/5. F. S. Hodder, to Home Aircraft Depot, Henlow, 7/6. D. I. Stewart, to School of Naval Co-operation, Lee-on-Solent, 25/6. L. B. McGoverne, to No. 84 Sqdn., 'Iraq, 8/6. F. G. Fairhead, to No. 30 Sqdn., 'Iraq, 7/6. G M. Buxton, to Home Aircraft Depot, Henlow, 25/5. S. H. Hardy, N. C. Pleasance, B. H. Ashton and H. V. Forbes to Home Aircraft Depot, Henlow, 7/6.

Pilot Officers D. Menzies, to No. 47 Sqdn., Middle East, 12/6. P. K. Robertson, to No. 14 Sqdn., Middle East, 13/6. C. V. Howes, to No. 45 Middle East, 9/6. J. K. Flower and J. Wilson, to No. 216 Sqdn., Middle East, 12/6. C. E. W. N. C. Pelly, to No. 216 Sqdn., Middle East, 12/6. The following Pilot Officers are all posted to R.A.F. Depot, Uxbridge Supernumerary, for a short disciplinary course on appointment to S.S. Comns. (on probation) with effect from 28/6: G. E. Agard-Butler, N. Alexander, F. C. Allen, C. A. Ball, G. Bearne, G. Calvert, N. J. Capper, D. I. Carlyle, I. A. Critchley, C. H. Glover, D. H. A. Golege-Steel, W. E. Grant, D. C. Harrison, W. J. Hodge, A. H. Houghton, G. M. Ievers, F. J. B. Keast, D. W. Lydall, I. L. S. McNicol, C. W. Marriott, T. G. Mellor, C. E. Morse, J. T. Mynors, B. Paddon, H. G. J. Purcell, N. Stratton, J. M. Waddell, G. N. Warrington, G. E. S. Williams, and S. N. Wiltshire.

STORES BRANCH.—Flight Lieutenants S. D. Dennis, to R.A.F. Depot, Uxbridge, 24/6. R. G. Gore, to Air Ministry (D. of E.), 24/6.

Flying Officers C. S. Whellock and D. G. McDiarmid, to R.A.F. Depot, Uxbridge, 24/6.

ACCOUNTANT BRANCH.—Flying Officer G. H. White, to No. 501 Sqdn., Patchway, 17/6.

MEDICAL BRANCH.—Flying Officer M. Clancy, to School of Naval Co-operation, Lee-on-Solent, 15/5.

The Third Levée.

By Command of the King a Levée was held on July 2 at St. James's Palace on behalf of His Majesty. Among those in attendance upon His Royal Highness was Air Chief Marshal Sir John Salmond, Principal Air Aide-de-Camp. Air Commodore P. F. M. Fellowes, Aide-de-Camp in Waiting, was also present.

The following officers of the R.A.F. were presented to the Prince of Wales by the Secretary of State for Air:—Flt. Lt. D. Blackford, on appointment; Air Commodore F. Bowhill, C.M.G., D.S.O., on appointment as Director of Organisation and Staff Duties, Air Ministry; Flt. Lt. T. Brown, on appointment; Flt. Lt. N. D'Aeth, on appointment; Sq. Ldr. N. Douglas; Sq. Ldr. A. Durston, A.F.C.; Flt. Lt. A. Ferris, on appointment; Flt. Lt. R. George, M.C., on appointment; Wing Cdr. R. Knowles; Flt. Lt. A. MacDonald, on appointment; Wing Cdr. W. McClaughry, D.S.O., M.C., D.F.C., on promotion; Flt. Lt. L. Polter, on appointment; Flt. Lt. E. Reid, on appointment; Sq. Ldr. J. Sadler; Flt. Lt. H. Scroggs, on appointment; Flt. Lt. E. Searle, on appointment; Flt. Lt. F. Skoulding, on appointment; Sq. Ldr. J. Slessor, M.C.; Sq. Ldr. M. Thomas, D.F.C., A.F.C.; Flt. Lt. C. Walter, on appointment; Flt. Lt. C. Weedon, on appointment.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident near Netheravon to an Atlas Machine of No. 1 Flying Training School, Netheravon, on July 2, Plt. Off. Ronald Yule Bootes, the pilot and sole occupant of the aircraft, was killed.

Flying Instructors.

The following officers of the R.A.F. have been categorised as "B" Flying Instructors and are thereby entitled to six months' antedate under para. 10 (ii) (g) of Weekly Order 103 of 1928:—

Flt. Lt. J. S. T. Fall, D.S.C., A.F.C., Flt. Lt. G. E. Wilson, Flt. Lt. J. W. Baker, M.C., D.F.C., Flt. Lt. J. Bradbury, Flt. Lt. C. Crawford, Flt. Lt. C. T. Walkington, Flt. Lt. A. L. Fiddament, D.F.C., *p.s.a.*, Flt. Lt. G. A. H. Pidcock, Flt. Lt. P. R. Chamberlain, A.F.C., Flt. Lt. C. B. S. Spackman, D.F.C., Flt. Lt. H. E. Forrow, Flt. Lt. J. Oliver, A.F.C., Flt. Lt. J. E. Kingston McCloughry, D.S.O., D.F.C., *p.s.a.*, Flt. Lt. F. W. Long, Flt. Lt. F. Wright, Flt. Lt. C. R. Steel, D.F.C. *p.s.a.*

Vacancies for Aircraft Apprentices.

Six hundred aircraft apprentices, between the ages of 15 and 17, are required by the R.A.F. for entry into the Schools of Technical Training at Halton, Bucks, and at Cranwell, near Sleaford, Lincs. They will be enlisted as the result of an Open Competition and of a Limited Competition which will be held in the near future by the Civil Service Commissioners and the Air Ministry respectively. Successful candidates will be required to complete a period of twelve years' regular Air Force service from the age of 18 in addition to the training period. At the age of 30 they may return to civil life or may be permitted to re-engage to complete time for pension.

Full information regarding the dates of the respective examinations, the methods of entry and the aircraft apprentice scheme generally can be obtained if early application is made to the R.A.F., Gwydyr House, Whitehall, London, S.W.1. In this connection the sons of officers, warrant officers and senior N.C.O's. of the three Services receive special consideration.

Vacancies for Stores Officers.

The Air Ministry announces that about eight vacancies for permanent commissions in the Stores Branch of the R.A.F. will be offered for competition among young men of between 23 and 25 years of age on Jan. 1, 1930, who have had not less than five years' business experience in a firm of standing. This will be the fourth competition under the scheme inaugurated in 1926 for the purpose of obtaining men with a business training to control and administer the supply of the highly valuable and complex equipment of the R.A.F.

Application should be made to the Secretary, Air Ministry (S.7), Kingsway, London, W.C.2, for the regulations and for application forms. Completed application forms should

reach the Air Ministry by Aug. 15 next, or at the latest by Sept. 1.

British Officers Honoured.

On July 4 Major Franco, Major Gallarzo, Capt. Ruiz de Alda and the mechanic, Serjt. Madariaga, together with Captain Laurence, Commander Robson, Engineer-Commander Paffett, R.N., Wing-Commander Field, R.A.F., and Lieutenant Kilroy, R.N. (Flg. Off. R.A.F.), of H.M.S. *Eagle*, were the guests of the Spanish Ministers of War and Marine, representing the Government, and Mr. Alexander Adams, Commercial Attaché, representing the British Embassy at Madrid.

Scenes of the greatest enthusiasm greeted their arrival at the Capital, and the crowd took matters into their own hands, climbing over trains and buildings and breaking down all barriers to get close to the party at the station. Government employees were excused work until 11 a.m. to allow them to take part.

The Marqués de Estella presided at a banquet in their honour at the War Office, and they had lunch with the Queen of Spain on the following day.

After a banquet at the Aero Club on July 6 Captain Laurence and his officers left for Seville, where they are being joined by other officers from the *Eagle* to visit the Exhibition and they will then return to their ship by way of Algeçiras.

On Saturday morning Captain Laurence and his officers were decorated with medals of Naval Merit by the Minister of Marine. The full list of honours comprises all ranks on duty when the crew of the flying-boat were rescued.

Celebrations similar to those in Madrid have been arranged at Algeçiras and also at Barcelona, where the *Eagle* will spend three days on her way to Malta.

The King of Spain, attended by the Spanish Naval Attaché, Captain Juan Pastor y Tomasety, was received by the First Lord of the Admiralty and the First Sea Lord at the Admiralty on July 3. His Majesty expressed, on behalf of the Spanish Nation, his appreciation and thanks for the services rendered by the Royal Navy on the occasion of the rescue of the Spanish aviators by H.M.S. *Eagle*.

The Dornier Wal is now on its way from Gibraltar to Cartagena in the Spanish steamer *Rionavia*, where it will be overhauled.

Spanish Awards.

Five officers of the aircraft-carrier *Eagle*, which rescued the crew of the Spanish Atlantic seaplane *Numancia*, were invested with the Spanish decorations awarded to them at a ceremony at the Ministry of Marine, Madrid, on July 6.

Captain N. F. Laurence, D.S.O., Captain of H.M.S. *Eagle*, received the Grand Cross of the Order of Naval Merit.

Lieutenant-Commander H. A. Taylor, Engineer-Commander W. F. Paffett, and Wing Cdr. R. M. Field, R.A.F., received the Medal of the Order of Naval Merit (second class).

Lieutenant R. A. Kilroy (Flg. Off., R.A.F.), of No. 402 (Fleet Fighter) Flight, R.A.F., received the Cross of the Order of Naval Merit (first class).

Wing Commander Norton.

Wing Commander E. W. Norton, D.S.C., whose appointment to command No. 58 (Bomber) Squadron is dated April 18, was born in 1893 at Newtown, Montgomery, and was educated at the Modern College, Oswestry. He served in the Royal Welch Fusiliers from 1910 to 1914 and in the Montgomeryshire Yeomanry from February 1914 to May 1915, when he was appointed a Probationary Flight-Sub.-Lieut. in the Royal Naval Air Service after a course of flying at the C.F.S.

In August 1915 he was posted to No. 5 Squadron, R.N.A.S., Dover, and a month later he went to No. 1 Wing, R.N.A.S., at Dunkirk. He was wounded in action in March 1916. He was promoted to Flight Lieutenant in June 1916 and in October of that year he was awarded the Distinguished Service Cross for shooting down the Ostende kite balloon under severe anti-aircraft fire. A description of this incident is contained in Admiral Sir Reginald Bacon's book, "The Dover Patrol."

In June 1917 he was promoted Flight Commander and posted to R.N.A.S. Headquarters. In December 1917 he was promoted Squadron Commander. His foreign decorations include the Belgian Order of the Crown (Officer), the French Croix-de-Guerre (with palm) and the Belgian Croix-de-Guerre.

On the formation of the R.A.F. he became a Major and about the same time he was posted to Cranwell. In October 1918 he was posted to No. 5 Group, H.Q. British Expeditionary Force, and from there, a few days later, to No. 204 Squadron. In August 1919 he was appointed to a permanent commission in the R.A.F. with the rank of Squadron Leader.

In March 1920 he went to Halton to the Staff of the School of Technical Training (Boys). In October 1923 he was posted to No. 1 Flying Training School, Netheravon. In December 1924 he was appointed to command No. 6 Armoured Car Company, 'Iraq.

He was promoted Wing Commander in July 1925, and the following December he took over command of No. 70 (Bomber) Squadron, Hinaidi. In September 1926 he returned to England and attended a course at the R.N. Staff College, Greenwich. From July 1927 to December 1928 he commanded No. 58 (Bomber) Squadron at Worthy Down and since then has been on the Staff of Station H.Q., Worthy Down.

No. 501 (Bomber) Squadron.

The postal address of the newly formed No. 501 (Bomber) Squadron is Filton, near Bristol. The telephone number is Filton 4, and the telegraphic address "Aeronautics, Filton."

No. 501 (Bomber) Squadron is the new Cadre Squadron, the *personnel* of which include a number of the Special Reserve.

The Andover Pageant.

The Royal Air Force, Andover, held their annual At Home on July 5.

The programme of flying consisted of ten events, several of which were in the nature of a rehearsal for the R.A.F. Display at Hendon on July 13. These included an air combat between one Sidestrand of No. 101 (Bomber) Squadron and two Siskins of No. 19 (Fighter) Squadron. The performance of the Sidestrand recalled mildly those entertaining manœuvres which Sq. Ldr. Haig and Sq. Ldr. Longton used to perform in byegone years in the Bourges and the Bugle. One Siskin is demolished without delay and the second had to rely on every art known to an experienced Fighter pilot to avoid the same fate.

Another item from the Display Programme was the individual aerobatics by two Gamecocks of No. 23 (Fighter) Squadron. This pair won the open competition for the honour of performing at the Display and there is doubt whether their performance can be equalled by any two pilots in the World.

Six parachutes were released from three Vimys of the Home Aircraft Depot, Henlow.

Also, a Wing of Virginias and Hyderabads flew over the aerodrome. Their return as they wandered in to land impelled a leader of a fighter squadron to suggest that they were coming home to be milked.

No. 41 (Fighter) Squadron demonstrated their usual accuracy and efficiency in a converging machine-gun and bombing attack on a tank. In the Display the tank will be replaced by an encampment.

Events at Andover which will not take place at Hendon were some stunting by the Hawker Hornbill from the Royal Aircraft Establishment at Farnborough, and a Fly-past of different types of aircraft. In addition to the standard Service types the spectators saw the Hornbill, the Gorcock and Service types not often seen, the Flycatcher Mark I, and the Dart.

A Squadron of Foxes also took part in the Andover Pageant. They dived past followed by two formations of Bristol Bulldogs, which were so quiet that they seemed slower, though, one was told, they were in fact faster on the dive low down and, naturally, being supercharged, very much faster high up,—as single-seat fighters should be.

The high wind prevented close formation flying, and live drops with parachutes.

The Central Band of the R.A.F. played during the afternoon, and it was a good show, as usual.—C. G. G.

Lawn Tennis.

The R.A.F. Lawn Tennis Championships will be held at Queen's Club from July 29 to August 3. They will be run concurrently with the Championships of the Army. All applications for entry forms should be made to Sq. Ldr. N. F. D. Buckeridge, Hon. Sec., R.A.F. Lawn Tennis Association, Room 865, Air Ministry, Kingsway, W.C.2.

FIXTURES FOR THE NEXT FORTNIGHT.

Friday, July 12.—R.A.F. Dinner.
Saturday, July 13.—R.A.F. Display.
Tuesday, July 16.—Aero Show opens.
Thursday, July 18.—S.B.A.C. Banquet to Foreign Visitors to the Aero Show.
Friday, July 19.—The Civil Air Ball.
Saturday, July 20.—Aerial Garden Party at Heston.
Thursday, July 25.—R.Ae.S. Conversazione at South Kensington Museum.
Saturday, July 27.—S.B.A.C. Banquet at the Savoy (official closing of Show).

THE PROGRESS OF THE "SOUTHERN CROSS."

The tri-motored Fokker (whirlwind engine) *Southern Cross*, piloted by Mr. Kingsford-Smith, which left Sydney on June 25 in an attempt to fly to England, left the Dum Dum aerodrome on July 3 at dawn, and landed at Allahabad soon after midday on the same day with magneto trouble.

The machine flew from Allahabad to Karachi on July 4. No further news of its progress after reaching Karachi was heard until it arrived on July 7 at Baghdad.

Lieut. Keith Anderson, who lost his life while searching for the *Southern Cross* in Australia, was buried at Sydney with full military honours on July 6. Twenty aeroplanes flew over the route of the funeral procession and dropped wreaths on the grave.

ANOTHER FISHING STORY.

The New York correspondent of *The Times* in a message dated July 4, states:—

At Lakehurst, New York, yesterday, Lieutenant Gordon, a naval airman, accomplished for the first time the feat of attaching his observation aeroplane to an airship. While the naval airship *Los Angeles* was cruising at a moderate speed Lieutenant Gordon came under the hull and, adjusting his speed to that of the airship, made contact through a hook between the upper wing of the aeroplane and a rigid trapeze suspended about amidships from the lower side of the airships hull. He hooked up three times, and each time detached himself and flew away. Aeronautical experts consider the test of great importance, as it will extend the range of bombing aeroplanes and give airships another weapon of defence.

As a matter of fact successful tests were made at Pulham, Norfolk, England, on Oct. 15, 1925, when Sq. Ldr. H. de H. Haig, flying a D.H.53, detached the machine from the airship R.33 in the air and re-attached the machine in the air. On this occasion the D.H.53 was slightly damaged. On Dec. 4, 1925, Sq. Ldr. Haig again made successful hooking and unhooking experiments with the D.H.53 from the airship R.33. Since then Flt. Lt. Ragg has performed similarly with a Grebe.

Successful experiments on similar lines were made on Sept. 18, 1923, at Langley Field, Virginia, when a Sperry Messenger biplane hooked and unhooked itself from the U.S. Army Airship D.111.

HOSPITALITY AT OLYMPIA.

Members of the Aero Clubs of all foreign nations are hereby notified that as members of the *Fédération Aéronautique Internationale* they will be welcomed as honorary members of the Royal Aero Club while in England. They will thus be entitled to all the privileges of membership of the Royal Aero Club, in Clifford Street, and also at the special Club Quarters which have been arranged for members of the Royal Aero Club at Olympia,—where the R.Ae.C. has taken a much larger room than that which has been used by the Club at previous exhibitions.

"PEACE HATH HER VICTORIES."

A *Reuter* message in *The Times* of July 5 states:—

When an aeroplane piloted by the president of the Canadian Aviation League, Major-General J. H. MacBrien, made a forced landing at a farm near Sydney, Nova Scotia, the tail-skid of the machine ploughed up a *cache* of 20 barrels of rum.

MORE ATLANTIC ATTEMPTS.

On July 3 a Sikorsky amphibian, named the *'Untin' Bowler*, piloted by Mr. Parker Cramer and Mr. Gast, and carrying Mr. Robert Wood, aviation editor of *The Chicago Tribune*, as passenger, left Chicago on the first stage of a flight to Berlin by way of Greenland. It arrived at Remi Lake, Ontario, after having stopped at Milwaukee and at Sault Ste. Marie to pass Canadian Customs.

On July 4 it proceeded to Rupert House on James Bay, a Southern extension of Hudson Bay, and left later for Greenland but was obliged to return on account of low visibility. It left James Bay again on July 5 and no further news of the machine has been heard since it announced by wireless that it was descending at Great Whale owing to poor visibility.

On July 8 Mr. Roger Q. Williams and Mr. Lewis A. Yancey left the beach at Old Orchard, Maine, in the Bellanca monoplane *Pathfinder* in an attempt to fly non-stop across the Atlantic to Rome.

These two pilots had previously attempted to take off in the Bellanca monoplane *Green Flash* at the time when the three Frenchmen and one American got away from Old Orchard in the Bernard monoplane *Oiseau Canari*, but their machine was damaged before getting off.

AIR-RAIL SERVICE IN THE STATES.

On July 7, Transcontinental Airways inaugurated a combined air-and-railroad service between New York and Los Angeles.

At 19.00 hours the "Airway Limited" left the Pennsylvania Station, New York, with sixteen passengers for Columbus. On the following morning these passengers left the Columbus Airport in two Ford three-engined monoplanes for Waynoka, Oklohama. At Waynoka the passengers transferred to a train for the night journey to Clovis, New Mexico. Here they again transferred to aircraft, and flew to Los Angeles.

By this means transcontinental passengers spend two nights in trains and two days travelling by air, the whole journey from coast to coast taking 48 hours—as against three and a half days by rail.

On July 8, the Los Angeles-New York service was inaugurated, the first eastbound aeroplane being flown by Colonel Charles Lindbergh.

MR. JOHN R. CAUTLEY.

On Tuesday, July 16, the opening day of the Aero Show Mr. John R. Cautley will arrive in England from the U.S.A and will be pleased to meet his many friends and acquaintances.

Mr. Cautley has long been associated with the Bendix Brake Co., and has had considerable experience of brake problems of all descriptions. Of recent years he has devoted his time to aeroplane brakes and he has been responsible for the development of the Bendix aircraft brake and wheel in the United States.

His present trip is being made at the request of Mr Herbert Clark, Managing Director of Bendix-Perrot Brakes Ltd., Birmingham. During his stay, his experience will be placed at the disposal of the technical staff of the British

BY INDIA'S CORAL STRAND.—The Aerodrome of the Bombay Aero Club. In the midd of construction. In the middle of the

Digitized by Google

Company, so that the development of aircraft braking throughout the British Empire may be rapidly advanced.

Mr. Clark will be very pleased to put Mr. Cautley's many associates in touch with him. Letters should be addressed to Herbert Clark, Bendix-Perrot Brakes, Ltd., Westwood Road, Witton, Birmingham.

TWO OR THREE ENGINES.

An engineer writes:—

The Daily Express recently urged Imperial Airways to announce that—"no more twin-engined aircraft will be used for cross-Channel passenger traffic"—

Now the Press has the power of influencing many people in high positions and it certainly should not be allowed to make such statements as these unchallenged.

Twin-engined machines *can* be made to fly on one engine with full load and any mathematician will agree that by the Law of Probabilities chances of failure with such an aircraft are less than where three engines are used, and the machine requires two of them to remain in the air.

Twin-engined machines are undoubtedly quieter to fly in owing to the absence of slip-stream round the fuselage, and are easier to design from the point of view of the pilot's cockpit owing to the absence of the nose engine.

Therefore by limiting themselves to the use of three-engined aircraft Imperial Airways would be handicapping designers and retarding progress. Let them by all means elect to use only such twin-engined machines as can retain height on one engine with full load and scrap all those older machines which cannot, but to limit design in any way would undoubtedly be a retrograde step.—C. M. C.

[One proposes to deal at length with this question and others when the inquiry into the accident to the *City of Ottawa* is finished.—C. G. G.]

INSURANCE AND AIRWORTHINESS.

A recent note on the renewal of Airworthiness Certificates after inspection by representatives of the British Aviation Insurance Group was based on a misapprehension caused by the wording of the official notice on the subject.

That notice distinctly conveys the idea that some time in the not far distant future the British Aviation Insurance Group will definitely decide the renewal of Certificates and issue the necessary documents.

The arrangement with the Air Ministry is in fact that the British Aviation Insurance Group will maintain a staff of inspectors, probably drawn from present A.I.D. personnel, who will view machines every three months for insurance purposes. Once a year these reports will be considered by the Air Ministry, and if they are satisfactory the Air Ministry, as such, will issue a renewal of the Certificates on the strength of those reports.

If the owner of the machine does happen to disagree from the views of the inspector appointed by the British Aviation Insurance Group he or she will still, presumably, have *the right* to have the machine separately inspected by the Aeronautical Inspection Department.

The idea is ultimately that all aircraft shall be classified as Lloyds as are sea-going ships.—C. G. G.

THE HON. LADY BAILEY IN THE CITY.

His Royal Highness the Prince of Wales presided at a dinner given at the Mansion House on July 8 on behalf of the Royal Institute of International Affairs to welcome Sir Abe and the Hon. Lady Bailey on their return from South Africa.

In the course of a speech proposing the toast of Sir Abe and Lady Bailey, His Royal Highness said:—

> Before I submit this toast I have to say a word about Lady Bailey, who has up till now managed to avoid with typical feminine skill any celebration of her remarkable feat. She has been so quiet about it that it is hard perhaps to realise the scale and the pluck of her achievement. I, like many of you, have flown, or rather been flown, on various occasions, and we are always rather anxious before we go up to see that there is some fairly reliable outfit of maps in the machine; but Lady Bailey did not seem to worry very much about maps, and at one part of her journey her maps could have been contained in what a man calls his waistcoat pocket. They consisted of nothing more than the coastal outline furnished by the Union-Castle Company for the use of its passengers. But I must point out that Lady Bailey's achievement could never have been possible without a combination of high technical skill and great courage and endurance. Her performance will live long in the history of aviation, and as I once had the opportunity some months back of saying—I am very glad to say it again—Lady Bailey is a very gallant lady indeed. We all wish Sir Abe and Lady Bailey a long and happy life.

The Viscount Grey of Falloden joined cordially in the admiration which had been expressed for Lady Bailey's enterprise and courage.

Sir Abe Bailey, referring to his wife's flight to and from South Africa, said (according to *The Daily Mail*):—

> Airwomen are contesting and questioning man's efficiency and supremacy, and no doubt we shall soon be told a man's place is his home, and that the hand-rocked cradle rules the world and must be rocked by him.
>
> The coming event as far as I am concerned has already cast its shadow, and I suppose I shall glide into the next world as the dirigible husband.

ANOTHER LOST CHANCE.

THE AEROPLANE is always drumming in the lesson that if our manufacturers of aircraft will not produce what British organisers of air-lines want, especially abroad and in the Colonies, these organisers will be able to purchase what they require from foreign constructors. Here is further evidence.

The news has just come in that a three-engined Junkers G31 and a Junkers W33-34, of the well-known Bremen type, have been bought by a large English-Australian concern for freight-transport. The people concerned were very anxious to buy their machines in this country and made a tour of inspection through the Industry with this end in view. Owing to high prices and the prospect of having to wait for a year or so while machines were specially built, if ordered, the prospective customers gave up the idea of "Buying Imperially" and went abroad to the firm who had supplied them with their original equipment and who had material ready for the job, at a decent price and in the right time.

Will nobody in the Aircraft Industry realise that if aeroplanes are as good and as useful as we all try to think they are, they have other uses than as instruments of war, and there is more scope in supplying the needs of Commerce than in furnishing arms for War. And what price disarmament any-way.—T. J.

...the shade of the sheltering palm,—and to the right is the new tin Temple of Aeolus in course ... the left-hand page is the first woman pilot in Bombay.

AN HYDRO-AERODROME FOR HULL.

Hull's Municipal Aerodrome, a 200-acre site, four miles from the centre of the city, will be officially opened by H.R.H. Prince George on Oct. 10. The aerodrome has been leased to National Flying Services, Ltd., who will be ready to operate by the opening date. Two miles further east, on the river front, Hull has acquired a seaplane base. So, with accommodation for land and sea machines, Hull is going to make big strides in the future as an air port, and may justify Commander Kenworthy's claims for his constituency as an air port.

An Air Pageant is to be staged for the official opening in October. The main item on the programme will be a display by a squadron of R.A.F. fighters. Many famous aviators have been invited, and several of the aircraft firms have promised to send demonstration machines. The co-operation of the various flying clubs is being sought, and there will be a light aeroplane race for which three trophies and a special cup for Club entries are to be offered. There is also to be a landing-on-time competition as part of the Civil Rally, and two cups will be put up. The prizes will be presented by Prince George during the afternoon.

The full band of the R.A.F. has been engaged, and Hull hopes to start off its career as an air port in convincing style.

The Blackburn firm, whose works are at Brough, some way west of Hull, are giving their help, and are providing accommodation for visiting machines. The Air Minister has accepted the City's invitation to be present.

Further information about the Pageant and the club races will be willingly given by the Hon. Secretary, Mr. M. Goulden, *The Evening News*, Hull.

DELAYED CORRESPONDENCE.

Friends and enemies of The Aeroplane who have written to this office in the course of the past three weeks and have not had any answers to their letters will find the reason, not an excuse, when they see the Special Issue which will be delivered to subscribers, and can be got by ordering it from newsagents, on July 12, Friday of this week.

The production of that colossal issue has absorbed the whole time of most of the editorial staff, with the result that a small minority have had to deal with the various flying meetings of the past week-ends, and all the news of the World as well. Consequently ordinary correspondence has suffered.

Moreover, it is likely to go on suffering till after the end of the Aero Show on July 27. So if nobody gets any answers to their letters until somewhere in the week beginning July 29 they need not be surprised, and if they do get answers they will be lucky.—C. G. G.

FURTHER DETAILS.

Unfortunately when the notes on the Wythenshawe Meeting were published recently there was no possibility of learning the names of the two distinguished gentlemen on the right of the group in which appeared our new Under-Secretary of State, Mr. Frederick Montague. Actually, the person immediately next to Mr. Montague is Mr. F. Warbreck Howell, Town Clerk, and the one on the extreme right of the group is Sir William Kay, formerly Lord Mayor of Manchester.

Sir William is Chairman of the Corporation Committee on Water Works and carries much weight in Manchester. He is a firm believer in the future of aviation and has done a great deal to further the scheme for a Municipal aerodrome.

One learns from various directions that there has been a certain amount of tenderness, if not exactly soreness, in the Lancashire Aero Club about the Wythenshawe Meeting. Apparently tickets for the 2s. enclosure were sent to the members of the club because all the members could not be asked into the Special Guests' enclosure, as the Manchester Corporation, who after all own the aerodrome, wanted something over 200 tickets for an enclosure which would barely hold that number of people.

BEAVERSFIELD OR FLYINGFIELD.

The following letter is comforting, especially the inference that a Competent Disciplinary Authority has been installed at the Heston Air Park:—

Sir,—The letter appearing under the above title in your issue of June 26 has been our only intimation of local residents experiencing any inconvenience from aircraft using Heston Air Park. We have, of course, held an inquiry but have failed to establish any proof of low flying.

We are given to understand that the Beaversfield Estate is south of the Great West Road, whereas Heston Air Park lies 800 yards north of the Great West Road. Under the circumstances, we do not think it likely that any aircraft coming in to land could be within hailing distance of the Beaversfield houses.

However, we would like to take this opportunity of stating that we are exceedingly anxious that aircraft using Heston Air Park should not cause inconvenience to local residents.

We have made a point of equipping all our own machines with silencers and have given instructions that unnecessary low flying over the Great West Road and Southall housing areas is to be summarily dealt with by the Air Park disciplinary authority.

(Signed) Nigel Norman,
Alan Muntz,
Directors, Airwork Ltd.

THE GIANT DORNIER.

The Dornier Company has completed at Friedrichshafen its latest product, the Do. X giant flying-boat.

This craft has a span of 160 ft., a length of 130 ft. and a height of 33 ft. It has twelve 525 h.p. Siemens-Jupiter engines in tandem pairs above the wing.

It is arranged to accommodate 120 passengers for a flight of a normal range of 620 miles and 60 passengers on longer flights. The interior of the hull is arranged in three decks, the lowest containing the fuel tanks, the middle deck the passenger accommodation and the top deck the navigating room, pilot's cabin engine control station and the crew quarters.

The Do. X is estimated to have a maximum speed of 1[illegible] m.p.h. and a cruising speed of 120 m.p.h.,—which is sensibl[illegible]

A model of this machine will be shown at the forthcoming Aero Show at Olympia.

WHEN LUBRICATION IS NEEDED.

The Aeroplane is not much interested in motor cars and motor bicycles, but there are lessons to be learned from these low (in altitude) vehicles, even by exalted aviators. Some time ago there was a 24 hours' car race at a place called Le Mans in France,—a locality which really owes its place on the map to the fact that Wilbur Wright flew there twenty-one years ago. In this race British automobiles called Bentleys finished first, second, third and fourth.

Also recently there were some motor-bicycle races in the Isle of Man for a prize called the Tourist Trophy.

In all these competitions the vehicles concerned put up quite decent speeds, for surface transport, though of course they were deadly slow from the aviator's point of view. Nevertheless the tests were quite severe, and without first class lubrication the machines could not have stood such high performance.

Therefore there is interest in noting that all the Bentley cars were lubricated by the Tecalemit high pressure system, and that all the motor-cycles were fitted with ordinary Tecalemit greasers. And Tecalemit lubrication is also "as done" on all the best aeroplanes.

THE C.I. ENGINE AT LAST.

COMPRESSION-IGNITION.—The first appearance of the Packard Compression-Ignition Radial Air-cooled engine. The picture is taken from a print in an American paper as no pictures or descriptions of the engine are yet available from the Packard Co. There is however, good evidence that the engine had flown long distances and is highly efficient.

PYRAMID-BRACING.

Sir,—Referring to the article in a recent AEROPLANE on "Wings with Pyramid Bracing":—

Your correspondent stated that the stiffness of the wing to resist torsion is roughly proportional to the length of the shorter side of the base of the pyramid, *i.e.*, the distance between the two spars.

It seems to me too obvious to need any explanation that the governing factor for stiffness is the *height* of the pyramid —*i.e.*, the thickness of the wing, and not the spar spacing.

As regards the statement that the pyramid bracing as shown in Fig. 1 should be several times more stiff than that shown in Fig. 2, I have worked out some comparative figures for both systems on the following assumptions:—

(*a*) Neglecting the deflection of the spars;
(*b*) Neglecting Euler loads in the struts—*i.e.*, an equal stress in all members;
(*c*) All wires having initial tension;
(*d*) Wing thickness 18 per cent. of chord, other dimensions and loads as shown in Figs. 1 and 2.

The result is a torsional deflection for the *single spar system* (*Fig.* 2) *of* 58.7 per cent. of that of the two-spar system.

In actual practice the pyramid members of System 1 have to be designed for Euler loads developing a much lower stress, and, therefore, they will deflect less, but this only at the cost of extra weight.

In a case where stiffness is of greatest importance and not merely strength alone, initial tension advantageously halves the actual deflection.

The two systems of torsion bracing also differ in the following points:—

System Fig. 1.—The rigid pyramid produces end-loads in the bottom spar-flanges AB and CD which are additive along the spar, and also stresses one set of the drag-bracing. These end-loads are quite appreciable towards the centre of the wing, with a distributed torsion along the whole spar is larger than the sum of the deflections of the pyramids when calculated separately.

Owing to these end-loads, a pure twist on the structure produces also a drag deflection, or, what is more important, pure drag produces also a twist of the wing, which is rather undesirable at top speed.

Obviously, the two spars will help a little to reduce deflection, and also some of these points may be overcome to some extent by reducing the stress in the members—*i.e.*, increasing the weight. In addition, only one flange of the two spars is stabilised, and this means the introduction of braced main ribs.

System 2.—Each pyramid is an independent unit, there are no end-loads, all loads are equally distributed on both flanges of the spar. Neither drag nor bending produce twist. The wires are short, aproximately half the length of the drag-bracing of Fig. 1—they are, in comparison, more like spokes of a bicycle wheel. The tension members will develop full stress. Both flanges of the spar are stabilised at half the distance of that in Fig. 1.

By these remarks I do not intend to detract from the merits of either system. Their success depends very largely on how and where they are used.

(Signed) H. T. STIEGER.

THE LONDON CHAMBER OF COMMERCE.

On July 3, at a meeting held in the Council Room, the London Chamber of Commerce decided to form a Civil Aviation Section of the Chamber of Commerce.

The meeting was presided over by Lord Herbert Scott, president of the Chamber, who in the inaugural speech said that the section had the support of such bodies as the Society of British Aircraft Constructors, the Royal Aeronautical Society, the Royal Aero Club, and the Air League.

He went on to say that to-day British aviation was almost entirely dependent on the support of the Air Ministry, and that support was largely dependent on the favour of the Treasury. Outside the Air Ministry the demand for machines was restricted to a relatively small number of flying clubs and to Imperial Airways. The fact was that, as a nation, we had not been educated to the use of the new transport of the air. We had been taught to look "seaways," and we must now learn to think "airways."

He would not suggest that air transport would ever supersede sea transport for all purposes, but he was convinced that, in the not distant future, it would be the normal means of transport for the conveyance of passengers and mails over the great trade routes, where the immense saving of time would more than compensate for the additional cost. It was a development which was bound to come, and he appealed to the great shipping industries of the country to show again that foresight and enterprise which their predecessors displayed and to make of aviation an auxiliary and ally, instead of what it must otherwise inevitably become, a competitor.

Sir Harry Brittain was elected chairman of the section for the first year, and Mr. Alan S. Butler and the Master of Sempill were elected vice-chairmen.

The following were appointed members of the Standing Committee: Lady Bailey, Sqdn.-Ldr. Lord Edward Grosvenor, Sir Charles Wakefield, Sir John Cadman, Lt.-Gen. Sir George McDonogh, Sir Alan Cobham, Sir Samuel Instone, Sir Alliot V. Roe, Brig.-Gen. P. R. C. Groves, Lt.-Col. Ivo Edwards, Capt. P. D. Acland, Mr. Harold Perrin, Mr. T. M. Sopwith, Mr. C. R. Fairey, Maj. F. P. Scott, Mr. A. F. Sidgreaves, Mr. G. Woods Humphery, Mr. F. E. Powell, Mr. Samuel Samuel, M.P., Capt. A. G. Lamplugh, Mr. F. E. Bray, Mr. Lawrence A. Wingfield, Major K. M. Beaumont, and Mr. Ivor McClure.

Sir Samuel Instone said that the London Chamber of Commerce could do a great deal to further the development of civil aviation. It would be a great encouragement if greater advantage were taken of the existing services. The best answer they could give to the Government when they sought assistance would be to be able to point to a great demand for the conveyance of mails and goods.

ORACULAR GROVES.

A correspondent writes:—

Throughout history there have been Oracular Groves which enjoyed popular notoriety. Oracular Groves were usually dark and gloomy and their utterances were confused, fatuous, and usually inaccurate.

Served by a drug-stupified priesthood who would not have comprehended the utterances from the Oracular Groves even if they had been intelligible, these Groves invariably became discredited after a short time.

If there were Oracular Groves in modern times (which Heaven prevent) they might easily become verbose upon Commercial Aviation. They would not, of course, know a thing about the matter, but their priesthood (in these days a stupid headline-hunting daily news-sheet of the lesser sort) would realise that as the public knew nothing at all about Aviation, it was a heaven-sent opportunity for Oracular Groves to talk through their topmost branches.

ANOTHER REFUELLING RECORD.

On July 7, Messrs. R. L. Mitchell and Byron K. Newcomb landed at Cleveland, Ohio, after having remained in the air for 7 days, 6 hours, 59 seconds, in a Stinson Detroiter monoplane.

This time is 1 hour 28 minutes longer than the previous refuelling record.

A LOSS TO PROGRESS.

On June 8 Col. John Hambleton and Mr. and Mrs. van der Hayden were killed by the crashing of Col. Hambleton's private aircraft when flying from Baltimore to Wilmington, N. Carolina.

Col. Hambleton was Vice-President of Pan-American Airways, which runs the service from Florida by Panama to Peru and Chile.

THE ITALIAN AIR ESTIMATES.

The Rome correspondent of the *Manchester Guardian* points out that the Italian Air Estimates for the coming year are at the same high level of 700,000,000 lire (£7,550,000) as has been maintained since 1926. Although the figures appear low compared with England or France, it must be remembered that money buys more in Italy.

The Italian Air Force consists of 97 squadrons, which are organised into 31 groups; with one airship division to every three groups. Figures recently published by the Government though not stating the number of reserves, give a total of 1,600 machines, 2,300 pilots, and 20,000 men.

AERONAUTIC ENGINEERING.

The Journal of the American Society of Automotive Engineers for May contains a section headed *Aeronautic Engineering*. From this number onwards the new section of the journal will be devoted to matters of aeronautical interest.

America has no body of quite the same status as our Air Ministry, so the S.A.E., among their multifarious activities, have taken on the job of getting out standards for the American Aircraft Industry.

The S.A.E. stand at the Detroit All-American Aircraft Show in the early part of April of this year had a display of aircraft parts made to S.A.E. standards. There were crankshafts from a Curtiss Conqueror, from a Pratt and Whitney Wasp, and from a Wright J.6, each of these had an S.A.E. No. 30 shaft-end, with the result that the same airscrew hub (*anglice* boss) would fit all three.

The stand also showed a number of generators, fuel pumps, and inertia starters all with S.A.E. standard mounting flanges. Storage batteries for aircraft to S.A.E. standards were also shown.

A NEW AMERICAN MOTOR.—The 185 h.p. Lycoming air-cooled engine mounted in a machine. The engine was designed by Mr. Valdemar Cronstedt.

THE NORWICH NAVIGATOR.—Mr. A. J. Richardson, of Norwich, who learned to fly at the age of 67, and flew direct across the North Sea from Cromer to Rotterdam in his Klemm-Salmson recently.

THE REASON WHY.

The Aeroplane is always drumming in the precept that any new find of value to the Industry as a whole should be made common knowledge among the Industry.

When Mr. Trubee Davison, the U.S. Assistant Secretary of War for Aeronautics, was asked by a correspondent of *U.S. Air Services* why the new ethylene glycol cooling formula had been released to the public, he replied that the (his department) felt that anything the Army found of value to commercial aviation should be given out.

This ideal of frank and open sharing of new ideas is one of the reasons for the success and rapid development of the industries of the United States.

AN ALLIANCE OF PIONEERS.

Curtiss-Caproni, Inc., a new company organised by Curtiss interests and the Societa Aeroplani Caproni, of Milan, has been formed to manufacture large commercial aircraft of the Caproni type under Curtiss supervision in the United States.

As Mr. Glenn Curtiss and Sig. Caproni were just about contemporaries in the pre-historic days of aviation as experimenters with aeroplanes which did not yet fly, this alliance of their modern firms is interesting. But one wonders mildly what there can be in any Caproni design which is better than anything the Curtiss Co. can produce for itself.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

CHEAP TICKETS FOR THE R.A.F. DISPLAY.

In some of the recent club notices secretaries have reminded their members that as members of approved light aeroplane clubs they are entitled to buy two tickets for the R.A.F. Display at Hendon on Saturday next for 10s., instead of paying 10s. each.

Curiously enough the majority of club secretaries did not consider that such an announcement was worth their while. Therefore one takes this opportunity of reminding all members of all light aeroplane clubs that they can buy two 10s. tickets for one half-sovereign.

This very handsome concession only applies to members of light aeroplane clubs, and not to members of the Royal Aero Club as such. And these special tickets are limited to one such purchase per member.

THE STAG LANE ACCIDENT.

At the inquest on John Anthony Barnett and William John Williams, who were killed when a three-seat Avro aircraft in which they were returning from Shoreham-by-Sea crashed on landing at Stag-Lane, the jury found that the accident was due to an error of judgment.

The third occupant, Dermot Esler, was injured and lies in a critical condition at Redhill Hospital, Edgware.

The pilot, Mr. Barnett, who held both A and B licences, came into the aerodrome gliding slowly down-wind and in turning to face the wind stalled and spun to the ground from about 200 ft.

A ROMANY MANIFESTATION.

As has been previously announced in the editorial and advertisement pages of THE AEROPLANE, a De Havilland Moth with a Gipsy engine has for some time past been engaged on a Reliability Test to get data as to petrol consumption, oil consumption, and wear and tear of parts.

Up to Monday, July 8, 485 hours had been done at average speed of 88 m.p.h. during which time 42,680 miles had been covered. Petrol consumption has been worked out at 4.7 gallons per hour and oil consumption ½ pint per hour. During all this time no part had been replaced, with the exception of a magneto in the early part of the test. This magneto was only changed because a slight defect developed in the original one, which could have been put right within an hour or so. As, however, the machine was wanted urgently, another magneto was fitted.

42,680 miles without even decarbonising is an extremely fine record and there can be very few motor-cars which could put up such a mileage under such conditions.

THE HESTON GARDEN-PARTY.

Saturday of next week, July 20, is a date to be noted and reserved. The Proprietors of the Heston Airpark, in conjunction with the Royal Aero Club, the Society of British Aorcraft Constructors and the Sport and the Trade generally, are giving a Garden Party at Heston Airpark in connection with an International Aerial Rally which the Royal Aero Club is working up energetically and in a hurry.

Invitations have been sent to all the Continental Aero Clubs, and though nothing official has been announced as yet there is a probability that prizes will be given for the Rally. After that there will be an International Aerobatic Competition in which the Aero Club hopes to induce the leading Continental pilots, such as Herr Udet and Herr Fieseler, to compete against our leading civil stunt pilots. After the International contest there will be an aerobatic Contest for pilot-instructors of the recognised Light Aeroplane Clubs, on Club machines. The best instructor is not necessarily the best aerial acrobat, by any means, but some of our Club instructors can stunt a bit, so this also ought to be amusing.

Apart from that there is the cheery atmosphere of the Heston Airpark to draw people thither, and all our foreign visitors to the Aero Show are being asked there, so altogether, given decent weather, it ought to be a very jolly afternoon and evening.—C. G. G.

BUSINESS AT READING.

The Phillips and Powis School, of Reading, seem to be doing good business. They have a new Gipsy-Moth for demonstration purposes on the aerodrome, as official Moth agents, and during the past month they have sold three secondhand Moths.

A GERMAN LIGHT AEROPLANE.—The latest Junkers, with a Siemens engine.

PROGRESS IN NEW ZEALAND.

A correspondent in New Zealand writes that Air Pageants are being held almost every week in New Zealand these days. Auckland's Aero Club set the fashion and Hawke's Bay followed, and now Christchurch wishes to follow suit, with Wanganui—which does not yet possess an Aero Club—desirous of emulating the others.

So far about a dozen machines have assembled at each "Pageant" (mostly Moths, with an odd Avian). These same dozen machines seem fated to appear at every future meeting, and the pilots should be quite accustomed to air-racing by the time the "Pageant season" closes.

These air meetings are making the public quite air-minded, but what is more important, the Minister of Defence in the new Government is doing a lot of flying, particularly in the North Island, and almost daily he has some item on air matters for publication in the daily Press.

The Government is considering its defence policy along with its new year's estimates, and its air policy will be announced shortly. An announcement has been made that the Prime Minister will make a statement on air policy in the near future.

Apparently either the new Government is alive to the advantages of aircraft in any scheme of defence, or else the Salmond Report has forced a radical change in our local Ministry of Defence.

Mr. Chandler's forced landing in Cook's Straits caused quite a stir for a little while, and for the future of aviation in New Zealand it is fortunate that the affair was not a disaster. The pity is that the Wakefield gift machine should have suffered such a fate.

A CIVIL AVIATION MEETING IN SPAIN.

Some time ago there was held on the aerodrome at Getafe a successful aviation meeting under the patronage of the Spanish National Association of Civil Pilots.

A large number of prizes were offered by the President of the Council, by manufacturers, i.e., Sanchez Quinones, Loring, and Elizalde; by the air transport companies, Union Aerea Espanola, and Iberia; by newspapers and reviews, such as *A.B.C.*, *La Nacion*, *El Imparcial*, *Aerea*, *Alas*, and by private individuals.

The De Havilland Moth was very prominent, taking its share of the prizes, as well as attracting a lot of attention by exhibitions of aerobatics. It will be remembered that in January, 1928, three Moths were purchased by Spain, two for the Spanish Aero Club and one for the personal use o its President, the Duque de Estremera.

The Loring Trophy for Aerobatics was won by Senor Ansaldo on a D.H. Moth. The *La Nacion* Cup offered f the highest speed was won by Senor Coterillo on a Junke F.13. There were two prizes offered for general efficien for machines over 80 h.p., the *A.B.C.* Cups being won b Senor Tonda on a Junkers F.13 and the Renault Cup b Senor Ansaldo on a D.H. Moth. A prize was also offer for machines of under 80 h.p. and the Union Aerea Espanc Cup for general efficiency was won by Senor Rexach on Klemm monoplane.

Five prizes were awarded as follows in the handicap: T Marques de Estella's Cup to Senor Rexach on his Klem monoplane; the Corominas Cup to Senor Cotorillo on Junkers F.13; the Aerea Cup and a model of a Rohrba monoplane to the Duque de Estremera; the *El Imparcial* C to Senor Ansaldo on a Junkers G.24, and the Osiris prize Senor Tonda flying a Junkers F.13 monoplane.

A MOTH AIR MAIL SERVICE.

Mr. A. S. White, chief demonstration pilot of the Havilland Aircraft Co. Ltd. delivered early last month first of two Gipsy-Moths which are to operate a Swed night postal service from Malmo to Oslo.

On reaching Malmo night-flying equipment was install and with a Norwegian pilot as passenger Mr. White f to Oslo, by way of Gothenburg, a distance of 350 mi which was covered in just over 4 hours.

The Gipsy-Moth left again for Malmo with the first ma and returned to Oslo next morning with the mails fr Malmo.

This service will operate daily, making the Oslo-Ma journey each evening and the return journey each morni By air this will take about 4 hours, whereas the rail journey takes 14 hours.

WATER AND FIRE RISKS.

When a light aeroplane was taking off at Wind Ontario, the pilot was thrown out into the river. The craft continued to fly over the city on its own for a minutes, and then, fortunately, joined the pilot in the ri

On June 13 an aircraft belonging to Pan-American ways crashed at Santiago de Cuba and caught fire. wireless operator was burned to death, and General Tay an official of the company, was badly burned. Three of passengers were slightly bruised.

HANDLEY PAGE
AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

A product of A AND P Research—

The A AND P Taper-gauge AXLE TUBE

THE A AND P Taper-gauge Axle Tube gives the greatest strength where the load requires it, and with diminishing load it takes full advantage of saving in weight It is more consistently reliable than a linered tube, by reason of its homogeneity and the accuracy with which it approaches theoretical perfection.

One such axle tube is of 1¾ in. outside diameter at the wheel end It is drawn with a wall of uniform 6 gauge thickness for the required distance, and then the wall thickness is gradually tapered down to 16 gauge (If desired, the fuselage end of the tube can also be made with any uniform gauge for any distance)

COMMERCIAL AERONAUTICS.

The London Terminal Aerodrome.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 19; Monday, 45; Tuesday, 42; Wednesday, 41; Thursday, 39; Friday, 37; Saturday, 37.

IMPERIAL AIRWAYS LTD.:

London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich: London—Ostend—Brussels—Cologne and return: Machines 85, passengers 732, freight 27 tons. India Route: Inward, passengers 5, mail 675 lbs.; outward, passengers 6, mail 550 lbs.

AIR UNION:

Paris—London and return: Machines 56, passengers 278, freight 19½ tons.

K.L.M.:

Amsterdam—Rotterdam—London and return: Machines 61, passengers 241, freight 14½ tons.

SABENA:

Brussels—London and return: Machines 12, passengers 51, freight 4 tons.

DEUTSCHE LUFT HANSA A.G.:

Amsterdam—London and return: Machines 26, passengers 47, freight 5¼ tons.

MISCELLANEOUS:

British machines 19, passengers 15.

Foreign machines 1, passengers 1.

Total number of trips by British machines 104, carrying 747 passengers. Foreign machines 156, carrying 618 passengers.

COMPARATIVE FIGURES.

Week ending July 6:

Machines, 260; Passengers, 1,365; Crews, 527; Total personnel, 1,892.

Corresponding week, 1928.

Machines, 230; Passengers, 1,542; Crews, 447; Total personnel, 1,989.

Corresponding week, 1927:

Machines, 168; Passengers, 1,048; Crews, 310; Total personnel, 1,358.

Corresponding week, 1926:

Machines, 161; Passengers, 1,051; Crews, 207; Total personnel, 1,258.

Corresponding week, 1925:

Machines, 172; Passengers, 851; Crews, 222; Total personnel, 1,073.

Corresponding week, 1924:

Machines, 173; Passengers, 741; Crews, 214; Total personnel, 955.

Corresponding week, 1923:

Machines, 111; Passengers, 542; Crews, 185; Total personnel, 727.

Corresponding week, 1922:

Machines, 145; Passengers, 326; Crews, 235; Total personnel, 561.

Corresponding week, 1921:

Machines, 115; Passengers, 426; Crews, 143; Total personnel, 569.

Corresponding week, 1920:

Machines, 108; Passengers, 232; Crews, 126; Total personnel, 359.

CROYDON NOTES.

Imperial Airways Ltd. have taken delivery of yet a third Argosy. Members of the staff are to be seen patting its flanks and offering it lumps of sugar. At present it merely snorts at these advances, but kindness will win.

K.L.M. expect the new three-Jupiter Fokker quite shortly. This aeroplane carries 18 passengers, two or three crew, and an adequate supply of petrol. It has a really roomy cabin.

The Antediluvian Order of Air Dogs (Duppas Hill Branch) are gravely considering the propriety of adopting coat armour. Several members already wear steel helmets and gilt spurs for cycling. Odds life and s'death! The days of chivalry are coming back. A certain knight who, by the way, breaks a pretty lance, or rather undercarriage, is rumoured to be consulting the Herald's office on the propriety of taking the words "*Je ne crache pas*" as a family motto.

A new and singularly viscid tarry compound has been sprayed over a portion of the grass at the edge of the tarmac apron. Our correspondent idly inspecting it recently found himself rooted to the ground just as a passing acquaintance offered him a drink.

One seems to remember daubing a similar compound on tree trunks at night to catch moths with the aid of a lantern. Light aeroplane owners should take heed.

A gentleman residing on the edge of the aerodrome has threatened to erect a steel mast 40 feet high armed with steel prongs. When he spears an aircraft a bell will ring in the kitchen, and when his mast gets struck by lightning his milk will turn sour.

The K.L.M. London—Berlin—Vienna service, leaving Croydon at 09.00, arriving Berlin 15.10 and Vienna 18.55 every day, is proving popular.

Organ P. Golley, the popular aeronaut to whom Lord Mayors bow the knee, seems somewhat abashed by the publicity given to his exploits in these columns. He refuses to tell us any more funny stories about himself.

The Fokker Works have produced a very useful freight-carrier, which the K.L.M. will make use of. It is a single-engined Jupiter job and is not unlike an improved F.VIIa. It will cruise at 96 m.p.h. and carry a pay-load of 2,733 lbs. with 970 lbs. fuel and 132 lbs. oil. This allows for a crew of two.

The pilot's cockpit is set forward and is not under the wing, and outside access to the cockpit is provided, so that the freight hold is larger and can be crammed from floor to roof.—SPRY.

NEW COMPANIES.

ALLISTON AVIATION COMPANY LTD.—Private Company. Registered July 6. Capital, £100 in £1 shares. Objects: To carry on the business of aircraft dealers, constructors and hirers, carriers of passengers and goods, storers and maintainers of aircraft and other vehicles, organisers and proprietors of aviation instructional schools and classes conducted on the club system of schooling or any other system, etc. The first directors are: W. Alliston, 13, Buckingham Avenue, Whetstone, N.20, motor garage proprietor. A. Alliston, 139, High Road, East Finchley, N.2, clerk. (Both permanent.) Secretary: A. Alliston. Registered Office: 139, High Road, East Finchley, N.2.

AEROTANK SYNDICATE LTD.—Private Company. Registered July Capital, £1,000 in 1s. shares. Objects: To acquire options to purchase patent rights for Great Britain, its Dominions, Colonies and Dependencies, and/or the U.S.A., numbered 189100, 240747, 27929, 259659 and 294424, or any of them relating to fuels and other tanks, pipes and the like, their linings or coverings and to adopt an agreement with P. Poberejsky. The subscribers (each with one share) are: H. Pizey, 110, Cannon Street, E.C.4, A.C.A. W. J. Kimmins, 16, Mortgrave Road, Penge, S.E., company secretary. Secretary: W. Kimmins. Solicitors: Ernest Salaman and Co., 62, London Wall, E.C.2. Registered Office: 65/70, Cannon Street House, 110, Cannon Street, E.C.

SATISFACTIONS.

DE HAVILLAND AIRCRAFT COMPANY LTD.—Satisfaction in full on May 10, 1929, of mortgage dated July 25, 1923, further charge dated July 1924, and mortgage dated Oct. 3, 1927, securing £12,000, £6,000 and £5,600 respectively.

PERSONAL NOTICES.

DEATHS.

BOOTES.—On July 2, at Netheravon, as the result of a flying accident, Ronald Yule Bootes, Plt. Off., R.A.F.

Mr. Bootes joined the R.A.F. with a short service commission March, 1928, and was posted to No. 1 Flying Training School, Netheravon, for a course of instruction.

de DOMBASLE.—On July 7, at a nursing home, Guy C. St. P. de Dombasle, O.B.E., Wing Commander, R.A.F.

Wing Commander de Dombasle was born in Calcutta in 1[illegible]. He joined the Gloucestershire Regiment in 1900 and saw service in South Africa. When War broke out in 1914 he was in Canada and immediately joined the 5th Canadian Infantry.

In February, 1916, he was seconded to the Royal Flying Corps as Observer. At the time of the Armistice he was Lieutenant-Colonel R.A.F., and in August, 1919, he was appointed to a permanent commission with the rank of Wing Commander. He was made an Officer of the British Empire in June, 1919, for distinguished services rendered during the War. In April, 1920, he was appointed to command No. 8 Wing at Marske and from there went to Group H.Q., Kenley.

In July, 1922, he was posted to H.Q., 'Iraq Command, for Air Duties. From October, 1923, to December, 1924, he was on the staff of the Station Commandant, Hinaidi. From January, 1925 to February, 1927, he commanded the R.A.F. Station at Northolt, and in August, 1927, he was appointed Inspector of Recruiting, R.A.F.

[Wing Commander de Dombasle, though not a young man, was one of the finest players of Lawn Tennis in the R.A.F. He never won a championship, but he was always there or thereabouts. He was a fine all-round sportsman, and won the affection and respect of those who served under or with him.—C. G. G.]

MARRIAGE.

ROPE—JOLLY.—On July 2, at St. Pancras, Ipswich, Sq. Ldr. I. Rope, R.A.F., son of the late Dr. Rope and Mrs. Rope, The Pr[illegible] Shrewsbury, to Lucy Doreen, daughter of Mr. and Mrs. W. O. [illegible], The Grange Kesgrave, Ipswich.

FORTHCOMING MARRIAGE.

GLENN—BEATH.—The engagement is announced between F[illegible] William Lowry Glenn, R.A.F., son of the late the Rev. William G[illegible] of County Tyrone, Ireland, and Mrs. Glenn, and Christian, daughter of David Leslie Beath, O.B.E., M.R.C.S., L.R.C.P., and [illegible] Leslie Beath, of Clan House, Bath.

BIRTH.

SUTTON.—On July 6, at Wellwick, Wendover, to Margaret Gri[illegible] wife of Wing Cdr. B. E. Sutton, D.S.O., O.B.E., M.C., R.A.F.—[illegible]

TANGANYIKA STARTS CIVILIAN FLYING WITH AN AVIAN

On March 16th a new page was written in the history of Colonial aviation. On that date the Governor of Tanganyika christened the first aeroplane owned by any British crown colony, protectorate or mandated territory and used for survey purposes only. Safety, dependability, ease in flying—all these factors had to be considered in the selection of the machine. The aeroplane chosen was an Avro Avian.

AVRO AVIAN

The safest, most dependable, easiest to handle light aeroplane. Used increasingly by flying clubs throughout the world.

ON THE R.A.F. DISPLAY.

For several reasons the Royal Air Force Display of July 13 is notable beyond those which have gone before. To begin with, it was the tenth Pageant, Display, Review, or whatever the authorities like to call it, which has been held by the Royal Air Force. And Saturday proved that in those ten years the Display has become one of the great events of the London Season.

How many people and how many motor cars there were at Hendon on Saturday has not yet been declared. There were certainly many more than at any previous Display. Admittedly the beautifully fine weather had something to do with the increase in the crowd. But such a crowd could not be drawn unless the British Public had become widely interested in flying in general, and in the Royal Air Force in particular.

The depth of the Nation's airmindedness will probably be proved during the week by the attendance at Olympia. But at any rate the R.A.F. Display can now be accepted as an annual attraction ranking with the Royal Tournament at Olympia and the Aldershot Tattoo.

Another reason why this particular Display should mark a point in History for all who are at all intimately concerned with Service flying is that it is the last Display which will be held while Marshal of the Royal Air Force Sir Hugh Trenchard is Chief of the Air Staff. In effect the Air Staff as such does not organise the Display, but the organising is done by a Committee which is for all intents and purposes appointed by the Air Staff. And anyhow nothing happens in the Air Force without the knowledge of the Chief of the Air Staff. He is indeed, as His Royal Highness the Prince of Wales said at the R.A.F. Dinner on Friday night, the Father of the Air Force. And therefore there was a peculiar fitness in the fact that the last Display to be flown under his care should prove to be the most brilliant of all.

Some of the more superstitious of the Air Force looked forward anxiously to this particular day because it happened to be the thirteenth of the month. They consoled themselves with the thought that at any rate it was not a Friday also. But some of them said grimly that after so many years without an accident there must be a crash at the Display soon, and that surely it must come on the thirteenth. Happily they were all wrong, for in spite of the intricacy of the manœuvres, and the multitude of the machines, and the particularly bumpy air there was never anything which looked like being an unpleasant incident.

Reason for Repetition.

Naturally there were those who complained that there was nothing new at the Display and that we had seen it all before. But one firmly believes that the Display has got to such a point, like the Tournament at Olympia, that people would be disappointed if they did not see the same things again, or almost the same things.

Moreover, the old-timers who did these same things eight or nine or ten years ago must remember that now they are being done by pilots who were little boys at preparatory schools when they used to consider themselves star turn aviators. And there is much satisfaction in seeing that these little boys have now grown up not only to do the same things which the old-timers used to fancy themselves for doing, but to do them better and more cleanly on machines which are heavier, and carry more equipment, and are thereby more difficult to handle, and are, in some cases at any rate, faster. In other words, if the Air Force never did anything new at its annual Display, it would continue to prove that each successive generation of pilots is at any rate just as good as anything we have ever had in the past, and that there were no legendary giants in those days.

Manœuvres which in the early days of R.A.F. Pageants were looked upon as things which could only be done by

ROYAL INTEREST.—H.R.H. the Prince of Wales, K. G., who is a Group Captain in the R.A.F., watching the Display at Hendon on July 13. Immediately behind His Royal Highness are Marshal of the Royal Air Force Sir Hugh Trenchard, Chief of the Air Staff, and Lady Trenchard.

Digitized by Google

men who had stared death in the face in war, and who consequently regarded any kind of peace-time flying as a reasonable risk, are now done as a matter of course by boys who only left school three or four years ago. And as a matter of fact nothing that is ever done at the Pageant is half so paralysing to watch as are the things which those same boys do over their own aerodromes,—especially when their particular Commanding Officer happens to be away on leave.

SEEING OURSELVES AS OTHERS SEE US.

On such an occasion as this, the description of our Tenth Display, there seems good reason for all of us who are on the inside of Service Aviation to see ourselves as others see us. One has therefore taken the liberty of lifting bodily from three of the papers which have somewhere about the largest circulations in this country and in the Empire,—and therefore probably represent between them the outlook of the majority of the people of this country,—articles which show how they regard the Display.

These papers are *The Observer*, which certainly represents the outlook of the good solid Englishman who is the backbone of the Empire; *The Sunday Express*, which may perhaps be taken as catering for those who want something rather more sensational; and *Punch*, which represents all that is best and sanest and most humorous in the English character.

Here is the editorial pronouncement from *The Observer*:—

WINGS AND THE MAN.

ARMS AND PEACE.

We write with the noise of planes in our ears. To-day is Air Force day, and never, surely, have conditions been more favourable to spectacular effect. The weather has given Lord Thomson a magnificent send-off. He left behind him a good record during his previous term of office. He now succeeds a Minister whom the Air Service held in deserved honour; we look to him to facilitate progress and to maintain efficiency.

There are critics who denounce the Hendon displays as militarist. We have no sympathy with them. So long as we continue to live in a world in which wars are theoretically possible, our Air Service must be a fighting service. The very conditions of our Empire, its long and disturbed Asiatic frontiers, its vast half-pacified African possessions, insist upon the development of the Service as a fighting arm.

THE AIR MINDED PREMIER.—The Rt. Hon. J. Ramsay MacDonald, M.P., Prime Minister, talking to the Rt. Hon. Arthur Henderson, Secretary of State for Foreign Affairs, at the R.A.F. Display.

CABINET INTEREST.—The Foreign Secretary and Mrs. Henderson and the Rt. Hon. Philip Snowden, Chancellor of the Exchequer, watching the flying at the R.A.F. Display at Hendon.

We yield to none in our zeal for disarmament in the air no less than on land and sea. But so long as air armaments are maintained, Britain cannot be content with second place. Our pilots and craftsmen are at least the equals of any in the world. In no State have they so vital a part to play in the general scheme of defence. That they should be crippled in their function by shortage of machines or inadequacy of equipment is intolerable. Our expenditure on armaments is high. That it should, nevertheless, leave us inferior in the essential element is a cardinal blunder in policy. Nothing short of air equality will serve our national and Imperial needs, and to attain it we are ready to face some abasement of our Naval Estimates.

We go further. Flight has now become an integral part of our civilisation. We are just beginning to realise the vast cultural importance of the air services which are bringing continents into touch. As an instrument of economic progress, too, the air survey has already proved its value in Canada and in tropical Africa. By its aid the preliminary work of years is reduced to weeks, and is accomplished with greater certainty and at a fraction of the cost. In the scheme of Empire development now at last launched, the Air Force will surely find great work to do.

But besides co-ordinating and amplifying man's activities, flight is widening the range of his knowledge. It is a striking thing, and significant of the essential unity of human history, that a new achievement which looks so confidently to the future should yet have potently contributed to the re-discovery of the historic past. Air archæologists have taught us the fact, not without comfort in a world so full of change, that where man's hand has once been busy its touch is never wholly obliterated. No civilised land has undergone more sweeping transformation than our own. How much survives to-day of the England of 1750? Yet the air is recovering for us the outline of the Britain which Rome laid out fifteen hundred years before the industrial revolution.

Let us not shut our eyes to the moral of these facts. They proclaim that if we are to retain our high place in the world we must be pioneers in the use of air machines. They remind us, too, that the air habit is breeding a new type of man with novel aptitudes and an outlook of his own. Official and voluntary agencies cannot do too much to extend this habit and to develop its consequences.

The Prime Minister has set a notable example. We congratulate him on his flight from Lossiemouth to London undertaken when men's nerves were shaken by a disaster. The attacks upon him for his use of Service machines have happily miscarried, have indeed brought us nearer the day when a plane will be permanently at the Prime Minister's disposal. And if the coming European conference should be held abroad, it is surely a matter of course that a flight of aeroplanes shall be at the service of the British delegation.

What the Press says!

"The record of the Napier engine is really marvellous."
Graphic—11th May, 1929

"In reliability, lightness, power, compactness and versatility this engine excels any prime mover in existence."
Tatler—8th May, 1929

"No other engine in the World has put such a list of notable achievements to its credit within such a short space of time."
Times Trade & Eng. Supplement 25th May, 1929

"When Englishmen can make such engines as these we may still claim to be in the van of mechanical invention."
Morning Post—27th April, 1929

"It must rank as one of the engineering masterpieces of the decade."
Yorkshire Post 13th March, 1929

Some recent Napier Achievements

The first non-stop flight from England to India was accomplished by a Royal Air Force Fairey monoplane fitted with Napier engine—4,130 miles in 50 hrs. 38 mins.

The first formation flight from England to Australia was achieved by four Royal Air Force Supermarine "Southampton" flying boats each fitted with two Napier engines—180,800 engine miles without mechanical trouble.

The highest speed in the air was accomplished by Flight-Lieut. D. D'Arcy Greig with a Supermarine Seaplane with Napier engine—speed 319½ m.p.h.

The highest speed on land was set up by Major Sir Henry Segrave on his Irving-Napier special with Napier engine—speed 231 m.p.h. Capt. Malcolm Campbell set up world's land speed records for 5 miles (216½ m.p.h.) and 5 kilometres (211 m.p.h.) with his Napier-engined car.

Digitized by Google

So wrote the editor of *The Observer* on the day of the R.A.F. Display for his readers on Sunday.

This is a notable pronouncement. It is slightly ponderous, as befits the dignified Englishman. But it does express very exactly that healthy Imperialism which deep down inside is as much part and parcel of the members of our Labour Government as it is of the oldest Die-Hard Tory.

With *The Observer's* reference to the Prime Minister all of us cordially agree. Mr. Ramsay MacDonald deserves every congratulation for taking to flying at his age, and for thus showing that he is as ready to trust his personal safety to the Air Force as he is to trust to it the safety of this nation to whose governing our King has been pleased to call him.

And the more our Labour Ministers see for themselves of our First Line of Defence the more they will learn to understand the spirit of the King's Armed Services. Learning the meaning of air-power in this way will do them all far more good than if they were merely carried about the country by taxi-planes even of the most luxurious.

Sensationalism.

The Sunday Express chose to commit its description of Hendon to Viscount Castlerosse, an Irish peer who supplements his income by writing Society gossip. Like so many ready-witted Irishmen Lord Castlerosse is more concerned with immediate verbal effect than with either good taste or accuracy,—and his witticisms are often of the kind best described as cheap. This may explain perhaps his appreciation and quotation of somebody who he says that he met in the Aero Club enclosure at Hendon, a man who in response to Lord Castlerosse's question "Well, what does this show cost?" replied without altering his expression or emphasising his voice "Three lives."

Lord Castlerosse's informant is reported as continuing:—

"Flying men lead a life that is just as humdrum as that of the motorist. All these people around me have turned up just to see these stunts because they think there is something wonderful, something magical in flying—something magical. And so there is, but we have just about touched bottom in the possibilities.

"I could not help feeling that in two years time we will see something that is nothing like what we watched to-day with heads upturned until our necks were almost out of joint.

"Thirty years ago you could have collected an enormous crowd to see a motor-car travel at sixty miles an hour. That feat is too ordinary these days. It will be just the same with flying.

"What do these stunts such as we saw to-day really mean? They mean that the pilots are cutting down the margin of safety. What thrills us to-day will bore us to-morrow. Flying has already become one of the everyday episodes of life abroad."

There is just enough truth in this to be slightly dangerous. Three pilots were in fact killed while practising manœuvres in connection with the Display. But they would have been performing these manœuvres exactly the same if there had been no Display, for the Display is only the final stage of the Annual Training of the R.A.F. And they would have stood at least as good a chance of being killed while doing that training.

ROYAL ARRIVALS.—Their Royal Highnesses Group Captains the Prince of Wales and the Duke of York arriving at Hendon for the R.A.F. Display.

The manœuvres which are served up as exhibition stunts for the crowd are in fact a mild form of the manœuvres which every pilot would have to perform to save his own life in an air fight. As one has already said, what the pilots do at Hendon is nothing to what they do over their

own aerodromes. And so, to say that the pilots are cutting down the margin of safety at Hendon is sheer nonsense.

A little further on Lord Castlerosse quotes a pilot, who he says earned distinction during the War and added to his honour afterwards, as saying:

"These people are here to witness an accident. It is the same old game as the bull-fights in Spain and the gladiators in Rome. Now we have the airmen at Hendon. Every year they will cut the margin of safety down to please the multitude."

This again is a partial truth. There are people in the crowd who hope for an accident, but the vast majority are there because they admire the skill and address of the pilots. Moreover pilots say these things without in the least meaning them. One pilot remarked jestingly the other day that probably the best way to give a crowd really good value would be to drop a parachute with a dummy stuffed with strawberry jam quite close to the crowd and then arrange that the parachute did not open. But that was only his fun, and it is a particularly English form of humour.

The most truthful comment for which Lord Castlerosse was responsible is his statement that "Watching flying these days is like watching cricket. To appreciate its finer points one must understand the game."

So one recommends to *The Sunday Express* that it sends to the next R.A.F. Pageant somebody of better taste who does understand the game. By so doing it would make itself more popular with its readers and would perhaps do something to help the progress of those vehicles which it is pleased to call airplanes.

The Essence of England.

After that to turn to the little poem in *Punch* is pure joy. One suspects the writer of the poem as being very much on the inside of Service Aviation. Even so, the Editor of *Punch*, who is probably the finest judge of his fellow countrymen in the World, recognised it as representing the truth, the whole truth, and nothing but the truth, about the Display.

It is the worthiest thing that has been done about it. And even here one strikes our slightly grim British humour in the reference to "The brightest lines of *Locksley Hall*," one of the World's dullest poems but for that reference to the "ghastly dew" rained "from the nations' airy navies grappling in the central blue."

DISCRETION.—A Supermarine Southampton of No. 201 (Flying Boat) Squadron, R.A.F., from Calshot, decides not to alight on the blue waters of Hendon Harbour.

At Hendon.

The Air Display, it would appear,
Grows more exciting every year;
And we who gratefully descend on
The broad champaign of breezy Hendon
May witness with a pleasant thrill
Yet bolder feats and subtler skill.
With sullen dronings deep and gruff
The heavy bombers do their stuff;
The speedy seaplanes let it rip,
The saucy Siskins reel and dip
In mimic combats which recall
The brightest lines of *Locksley Hall;*
And every sort of agile 'plane
Gyrates about the vast inane,
Providing palpitating shocks
For pretty girls in summer frocks.

While wondering laymen press to see
This brave aërial pageantry,
The seasoned experts puff their pipes
And quiz the latest super-types.
Their sharp discriminating eye
Explores the wherefore and the why
Of gadgets which I must confess
To me are wholly meaningless.
Their countenances quickly kindle
At sight of some new slot or spindle,
Or they'll exclaim with lively joy,
"Observe that trunnion block, dear boy;
Now what could be more neat and snappy?"
And off they trot supremely happy.

Elsewhere (a long-awaited treat)
Old friends from distant Stations meet;
They slap each other on the back
And talk of evenings in 'Iraq,
Recalling with a pleasant glow
Binges and japes of long-ago.
Oblivious of the stunts and loops
They chat in animated groups,
Or seek the cool refreshment pav.
And ask each other what they'll have.

Thus out at Hendon everyone
Enjoys his own congenial fun.
The simple soul may stand and gaze
In admiration and amaze;
The Service veteran grins with glee
And greets a pal from oversea;
The keen technician smacks his lips
And resolutely gets to grips
With quadrant arms and pivot clips;
But they are all agreed on this—
That here's a show too good to miss.

C. L. M.

So much for ourselves as other people see us. Now let u return to the aeronautical family, so to speak, as it wer

THE PAGEANT BEGINS.

In an earnest endeavour to celebrate the Tenth Pagean or Display, by getting a front row place for the first tim for the editorial automobile we arrived at Hendon at 10.1 hours. A charming young officer informed us that onl about four cars had gone through the gates at that time.

That gate must have been unpopular, for when we g inside the cars stretched all the way along the front ro from the old main gate at Colindale Avenue right up to th Royal Enclosure. And there were at least three rows cars half way up the hill. But we did strike a front sea exactly in front of the R.A.F. ensign.

By 11.00 hrs. the cars were eight deep behind us and b midday all the southern end of the aerodrome was stuffe with cars. Any that came in after that must have bee pushed out to Edgware or somewhere in that direction.

By lunch-time the wide promenade between the front ro of cars and the double row of cattle-pens which are honorif cally called boxes was about as easy to penetrate as the foo path of Kensington High Street on the first day of th Summer Sales. Standing on the top of the hill one coul look straight down over the heads of the crowd, like moving sea. At one time a curious ripple like a wave slowl moved along the heads of the crowd. Looking closer th turne out to be a raising of hats extending from one sid of th promenade to the other, and then with glasses on made out the form of Sir Hugh Trenchard all alone strol ing down the hill and being greeted by all the past an present Air Force people in plain clothes. Somehow i reminded one of a battleship and its bow-wave.

SMOKE WITHOUT FIRE.—Aerobatics with coloured smoke by two pilots of the Aeroplane and Armament Experimental Establishment, Martlesham, flying Gloster Grebes (Jaguar engine).—(*"Aeroplane" photograph.*)

THE FIRST FLYING.

At about 10.30 hours, long before the proper time for opening any programmes, the condemned kite balloon was sent aloft and a formation of Fairey Flycatchers commited an entirely unprovoked attack on it. Somebody in the Organising Committee must have felt that there were already so many people in the enclosures that some sort of show ought to be put up to entertain them.

Every fresh arrival seemed to think that he or she ought to have been the first on the ground and greeted those who had got front row positions for their cars by asking whether they had been there all night. If things go on at this rate we shall arrive at the point of parking our cars in Colindale Avenue and the new arterial roads the night before, like a theatre queue for a first night. And the crowd will have to be put in the aerodrome while the machines take off from the alleys which are now used as promenades.

Anyhow, it was all very jolly and everybody was in great form and during the couple of hours before the first part of the show began there was plenty of time to meet friends and talk over old times,—exactly as in the *Punch* poem. And then on the stroke of twelve up went the first machine in Event A.—C. G. G.

THE LETTERED EVENTS.

BY C. M. MCALERY.

The programme of the R.A.F. Display is divided into two sections, the Lettered or Morning Events and the Numbered or Afternoon Events. The original scheme for holding the Display between the hours of 3 and 6 broke down several years ago, partly because thousands of spectators insisted on arriving at Hendon soon after breakfast and the authorities decided that such enthusiasm ought to be rewarded, and partly because the activities of the R.A.F. are so varied that it is impossible to give the Public an outline of their range in less than six hours.

Because it would be discourteous to those members of the Royal Family who invariably honour the Display with their presence, to ask them to appear at the ninth item instead of at the first, the programme is arranged accordingly. The most important and spectacular events are supposed to be in the afternoon, so that the greatest number of spectators may see them. Certain of the events are shifted year by year with the result that those who cannot be there before 15.00 hours will eventually see everything if they only persist in their attendance. This year, for the first time, the message-picking-up by an Army Co-operation Squadron, was performed in the afternoon to the great interest of many who had not seen it before.

Those who think that nothing of importance happens in the morning should disillusion themselves. Several of the eight Lettered events equal in every way the fourteen Numbered Events of the afternoon.

THE RESERVISTS.

The Display started at 12.00 hours with the Reserve of Officers' Race. This Race was between pilots of the Reserve of Air Force Officers trained at the various training centres and schools. The course was aproximately 28 miles and the pilots flew standard training Avro Lynx aeroplanes. The result of the race depended on the skill of the pilot plus the efficiency of the mechanics in keeping their machines in first-class condition.

The competitors were:—Flg. Off. F. Ellam, Reserve Flying School of the De Havilland Aircraft Co. Ltd., Edgware; Flg. Off. E. V. Culverwell, Reserve Flying School of the Bristol Aeroplane Co. Ltd., Filton, Bristol; Flg. Off. R. N. Riddell, Reserve Flying School of Sir W. G. Armstrong Whitworth Aircraft Ltd., Coventry, and Flg. Off. H. T. Messenger, Reserve Flying School of the North Sea Aerial and General Transport Co. Ltd., Brough, Yorkshire.

The winner, most appropriately, was Flg. Off. H. T. Messenger,—who might now be known as Mercury.

STAR TURNS.

Event B was, in the opinion of a number of experts, the finest piece of flying in the whole day. It was described in the programme as "Individual Aerobatics." The pilots, Flg. Off. J. Clarke and Sjt. T. W. Morton, of No. 29 (Fighter) Squadron, were the runners-up in the Fighting Area Aero-

The return of the Bustle

Digitized by Google

GRACE AND AGILITY.—The Fairey Foxes (Curtis D.12s) still provide a sensation. —(*"Aeroplane" photograph.*)

batics Competition, and only a Solomon could have decided between them, and the winning pair, Flg. Offs. Jones and Purvis of No. 23 (Fighter) Squadron, who demonstrated their skill later in the Display.

Mr. Clarke and Sjt. Morton flew their Jaguar-engined Siskins as though one pilot controlled the two machines. Their manœuvres were perfectly timed and faultlessly synchronised. More elaborate aerobatics may be evolved in the future and undoubtedly machines better adapted for such work will appear year by year, but two better pilots will be hard to find. Their performance showed how very high is the standard of flying among the post-war pilots of the R.A.F.

Every Fighter Squadron in the Service entered two pilots for the Aerobatics Competition after a series of eliminating trials within each Squadron. And even then the margin between the best Squadron and the worst was so narrow as to be indefinable to the ordinary inexperienced spectator.

No. 29 (Fighter) Squadron is living up to its distinguished past. The Squadron was formed in March, 1916, and in August, 1918, created a Squadron record for the Armies in France by destroying 51 enemy aircraft. The late Major J. T. B. McCudden, V.C., won the Military Medal and received a commission in the Field while serving with No. 29 Squadron. Aerobatic flying is an essential part of Service flying training, and skill in its performance is a sign of military efficiency.

THE ROCKING HORSE.

Event C was a demonstration of slow flying in a D.H. Gipsy-Moth fitted with slots by Sq. Ldr. D. S. Don, Officer Commanding No. 24 (Communication) Squadron. The Moth is now standard Service equipment for training and communications and Sq. Ldr. Don showed how easily it can be controlled with slots at slow speeds and when stalling. slithered about the sky defying all the elementary rule aviation; it bucked, bounced and stood on its tail for all world like an intoxicated rocking-horse. The slotted M may not be a valuable vehicle for training a Service p but it may easily be a kindly disposed and reliable mo for his nursery days, or alternatively, an emphatic me of teaching him that his future lies on the ground, with taking his life as the price of the lesson.

AUXILIARIES.

Event D was the final of a relay race between Ca (Special Reserve) and Auxiliary Squadrons of the R.A The race was over a course of approximately 14 m and each Squadron used three Lynx Avros.

The eliminating rounds of this competition were held fore the Display in three different districts. In the f round No. 601 (County of London) Squadron beat No. (City of London) Squadron. As a matter of fact No. Squadron won the race but was disqualified, one of the pil having failed to round a turning point properly. No. (City of Glasgow) Squadron had to race No. 603 (City Edinburgh) Squadron. The winner of this race was beat by No. 503 Squadron. No. 503 (Special Reserve) Squadr Waddington (Lincoln), beat No. 504 (Special Reserve) Squa ron, Birmingham.

The final of the Display, therefore, was between No. 6 Squadron and No. 503 Squadron and resulted in a win f the London Squadron. The winning team were Flg. O Carken, Flg. Off. Haward and Flg. Off. Schreiber.

GUNNERY-OBSERVATION.

Event E was a demonstration of Artillery Observatio This was intensely interesting for those who took the troub to read their programmes and follow what was going o

INTERNATIONAL AERO EXHIBITION OLYMPIA

July 16-27, 1929

Come and inspect at close quarters all the latest aircraft.

A vast array of machines and engines —British, French, German, etc.— are on exhibition.

You can view at leisure, land 'planes, seaplanes and flying boats.

Engines ranging from 1,000 H.P. to 60 H.P.

Aeroplanes from the small private machine to the great triple-engined passenger-carrying craft—from the single-seat fighter to the giant bombing machine.

Many new aircraft secret machines, just released by the Air Ministry, will be displayed for the first time at this exhibition.

The greatest and most up-to-date display of aircraft ever assembled under one roof.

Even for those who did not the battle between the reconnaissance and the fighter was particularly good.

The demonstration showed how the pilot of an artillery observation aeroplane communicates the position of a target to the guns. The target consisted of four ammunition lorries which were in the middle of the aerodrome and the aeroplane was an Armstrong Atlas (Jaguar engine) of No. 13 (Army Co-operation) Squadron. The pilot, Flg. Off. P. N. R. Hallward, communicated with the guns by wireless telegraphy and directed their fire on the clock-code system after informing them of the nature and position of the target.

In the middle of the operations the observation machine was attacked by an enemy Fighter, Flt. Lt. J. L. Airey, D.F.C., No. 3 (Fighter) Squadron, in a Bristol Bulldog (Jupiter engine). The Atlas, after a tremendous battle, drove off the Bulldog, which disappeared over Mill Hill trailing clouds of smoke, and resumed his corrections.

In the meantime two of the four lorries had escaped and the other two remained on the aerodrome "disabled" otherwise conveniently over the necessary explosion. Punctually to a second they were destroyed by gun-fire and the Atlas pilot, according to the programme, "continued his patrol," but according to any Infantryman "went home to his tea."

THE PEN-PUSHERS' HANDICAP.

Event F was the now famous Headquarters Race. Theoretically the spectacle of officers from the various Headquarters disporting themselves in assorted aircraft ought to be intensely funny, but in actual fact many of those who are temporarily in these jobs are equally as good as pilots as are those who are with squadrons or training stations. The suggestion that each Headquarters should be represented by an officer of not less than 50 years of age might add to the amusement of the irreverent, but would not be fairly representative of Headquarters Units. This year the Air Ministry was represented by Flt. Lt. W. J. Jones, in a Gamecock; A.D.G.B. by Sq. Ldr. H. G. Bowen, M.B.E., in a Grebe; Coastal Area by Flt. Lt. E. F. Waring, D.F.C., in a Flycatcher; Fighting Area by Flt. Lt. S. D. Macdonald, D.F.C., in a Fairey IIIF.; Inland Area by Flt. Lt. S. D. Earp, D.F.C., in a Gamecock; Wessex Bombing Area by Wing Cdr. W. A. McClaughry, D.S.O., M.C., D.F.C., in a Bristol Fighter; Cranwell by Flt. Lt. R. A. George, M.C., in a Siskin, and Halton by Flt. Lt. C. D. Adams, in a Siskin.

Thus the reader may see that no competitor was higher in rank than Wing-Commander, and so, as a young Squadron Leader remarked, it held out no hope of accelerated promotion.

The race was a handicap over a 28-mile course for a cup presented by H.R.H. the Duke of York, K.G. The winner was Flt. Lt. C. D. Adams, with Flt. Lt. R. A. George, M.C., second.

AN AFFAIR OF SMOKE.

Event G was a novel one for the Display. It consisted of an exhibition of individual aerobatics in Gloster Grebes by Flt. Lt. J. Bradbury and Flt. Lt. G. E. N. Guest, of the Aeroplane and Armament Experimental Establishment, Martlesham Heath.

The machines were equipped with the Savage Skywriting apparatus for coloured smoke. The pilots did all the usual aerobatics including some spectacular upward spins, the half-roll off the top of a loop, slow and flick rolls and half-inverted loops. During each evolution they trailed orange-coloured smoke with a highly spectacular effect.

Although the wind was blowing in stiff gusts the smoke hung long enough to outline most of the movements and if the day had been windless it would have hung about and impeded the view of the succeeding stunt. Some evolutions did not show up so well in the smoke as others, for instance all rolls left the smoke in a straight line. The possibility of each machine being equipped with two lots of different coloured smoke arises. This would show up horizontal manœuvres as well as vertical ones.

HUNTING THE HYDROGEN.

Event H was a demonstration of Balloon Chasing. A number of hydrogen-filled balloons were released and pursued by Flt. Lt. F. R. D. Swain and Sjt. J. G. Freeman, of No. 23 (Fighter) Squadron in Gloster Gamecocks. The skill of the pilots and the manœuvrability of the machines resulted in the wholesale demolition of the balloons.

This ended the Lettered Events and there was an interval of half an hour before the programme proper began.

A KIT QUESTION.

By this time the breeze had dropped somewhat and the air was distinctly hot. The possibility of authorising tropical kit at any rate for the R.A.F. personnel actually taking part in the flying, is one which might engage the attention of the Higher Command. On an official occasion like the Display full Service dress including puttees has to be worn under regulation flying kit and, judging by the comments of some of the pilots concerned, their condition was far from comfortable.

THE NUMBERED EVENTS.

BY C. G. G.

Event No. 1 of the afternoon was described as "Evolutions by Three Fighter Squadrons." There were No. 1, Sq. Ldr. E. O. Grenfell, M.C., D.F.C., A.F.C., No. 25, Sq. Ldr. L. G. S. Payne, M.C., A.F.C., No. 43, Sq. Ldr. C. N. Lowe, M.C., D.F.C. All were on Armstrong Whitworth Siskins with Jaguar engines,—27 machines in all with 450 h.p. each or 12,050 h.p. to take 27 little men into the sky. A bye-stander with a taste for arithmetic started to work out how many engine-revolutions this meant in the course of the evolutions but gave it up as a bad job when he saw the three lines of machines becoming apparently inextricably mixed in the sky.

The squadrons took off in formation and then strung out into flights astern, and to line ahead, so that they formed a

"GLORIA FINIS":—(The Motto of No. 43 (Fighter) Squadron).—No. 43 (Fighter) Squadron coming in to land over part of the crowd at the R.A.F. Display after taking part in the Evolutions by a Wing of Fighters.

Digitized by Google

vast snake and played follow-my-leader all over the sky. But it was nothing like as sensational as was the performance last year when three squadrons flew in a ring over the aerodrome while a fourth squadron dived in formation through the middle of the ring. Nevertheless it was all very well done, and 43's formation seemed to keep station better than the others.

The Prince Arrives.

At 15.10 hours, during the Manœuvres by the Wing of Fighters, the Prince of Wales, and the Duke and Duchess of York arrived. The Royal Party were received by Marshal of the R.A.F. Sir Hugh Trenchard, Lord Thomson, Secretary of State for Air, and Senior Officers of the R.A.F.

Among those present in the Royal Enclosure were:—

King Alfonso and the Infante Don Alfonso of Spain, the Prime Minister, the French Ambassador, the German Ambassador, the American Ambassador, diplomatic representatives of Spain, Turkey, Portugal, Japan, Norway, Poland, Greece, Serbs, Croats and Slovenes, Persia, Chile, 'Iraq, Czechoslovakia, Brazil, Switzerland, Egypt, Austria, Latvia, and Lithuania; Lord Parmoor, Mr. Philip Snowden, Mr. Arthur Henderson, Mr. J. H. Thomas, Mr. Shinwell, Mr. C. G. Ammon, Lord De La Warr, Mr. W. Graham, and Mr. Tom Shaw.

The High Commissioners for India, New Zealand, South Africa, South Rhodesia, Canada, and the Irish Free State.

Lord Hailsham, Lord Salisbury, Lord Peel, the Hon. Frederick Guest.

The Maharaja of Rajpipla, the Maharaja of Rewa, the Maharaja of Alwar, the Sultan of Johore, and the Raja of Kalsia.

Lord Reading, Lord Lewisham, Lord Camrose, Lord Lucan, Lord Leigh, Lord Somers, Lord Hugh Cecil, Lord Weir, Prince of Purachatra of Siam.

Admirals of the Fleet Lord Wester-Wemyss and Sir Henry Oliver.

Generals Sir William Peyton and Sir Bruce Hamilton, Lieutenant-Generals Sir Hastings Anderson and Sir Webb Gillman.

Air Marshal Sir Geoffrey Salmond; Air Vice-Marshals Sir Sefton Brancker, Sir John Steel, Sir Philip Game, F. R. Scarlett, C. A. H. Longcroft, C. L. Lambe, F. C. Halahan, Sir Vyell Vyvyan, Sir Oliver Swann, D. Munro, R. H. Clark-Hall, H. C. T. Dowding, and A. E. Borton.

The following were presented to the Prince of Wales:—Wing Cdr. J. B. Graham, who has been associated for five years with the display; F-S. Wood, who has piloted an aeroplane on 500 occasions when parachute descents have been made; and Flt. Lt. Chick and Flg. Offs. Boyle and Johnson, who gave a display of flying upside down in Moths.

23 Squadron Again

Event No. 2 was "Individual Aerobatics" by the winning pair of pilots in the fighting Area Aerobatics Competition, Flg. Offs. C. H. Jones and H. A. Purvis of 23 Squadron in Gamecocks with Bristol Jupiters. Comparisons are odious so no effort will be made to compare their performance with that of the two pilots of 29 Squadron in the morning. Each in its way was a perfectly polished show.

23 Squadron has an advantage in that the Gamecock is nippier on its controls than the Siskin and so lends itself better to this class of work. Anyhow these two pilots were not called upon at Hendon to do anything which had any difficulties or dangers for them, and what they were called upon to do they did quite perfectly and proved themselves to be worthy of the old traditions of 23 Squadron which was quite one of the best things that ever happened in France.

The squadron was formed in March, 1916, so they were quite early in the game. They were one of the first squadrons to be equipped purely for fighting and they fought extremely well. A week or so before the Armistice one came across 23 in France equipped with Sopwith Dolphins and engines which had to be changed after every patrol because they had a nasty habit of setting fire to their own airscrews. They had a whole sugar factory laid out as a workshop where they used to rebuild their own engines in the field. They had Major W. J. Bryant, D.S.O., a Hussar officer as their C.O., and Major Pye-Smith another cavalryman as their Recording Officer, and they have held to the cavalry tradition ever since. Doubtless you remember the cavalry subaltern who defined the function of cavalry in war as being "to give tone to what would otherwise be a mere vulgar brawl."

Pandering to the Press.

Event No. 3, "Parachute Descents," deserves to be heartily disapproved. It is the one event in the programme which does pander to the worst element in the crowd. The good Mr. Leslie Irvin may have got his parachutes up to 99 recurring per cent. reliability, but some time or other the one point is going to stop recurring and an accident is going to occur.

Apparently the only people who don't mind it are the parachutists themselves. If they did one would probably start a Society for the Prevention of Cruelty to Airmen.

The three ancient Vimies, dating back to a period when the Atlantic was still uncrossed by air, wallowed off the ground just before the two pilots of 23 Squadron took off for the previous event, with the six gallant airchutists each glued to his strut, and they went off for a tour over the surrounding country for a good quarter of an hour standing in the open thuswise. It was enough to give them the deaths of cold, only that they happened to have about the coolest job of the day.

Those men must train assiduously for the job, for the whole six came off at once like six corks out of six bottles. The drop was beautifully timed, for all six fell well with the aerodrome, although from the upper enclosures they seemed to be right over the top of the machines at the North end of the ground.

One man had evidently had too much lunch before starting for he came down rather faster than the others and so

Digitized by Google

on top of a friend's parachute (perhaps after this one more insult he is no longer his friend). As the photograph shows, he did his best to spill the air out of his own parachute so as to slide to the side of the one on which he was sitting. And when the man below found that he was being sat upon he opened his supplementary parachute. But actually the lower one came to ground safely under the power of his first parachute and no harm was done.

THE MERRY, MERRY MARINERS.

Event No. 4, "Flying Boats," gave the Hendon crowd their first view of the seafarers of the R.A.F. over London. The boats were Supermarine Southamptons (Napier Lions) belonging to 201 Squadron, Wing Commander D. G. Donald, D.F.C., A.F.C. These boats flew up from Calshot, came in from the Harrow direction in very pretty formation and thence flew out over Hampstead, whence presumably they returned over West London.

One boat detached itself from the rest and came back, low down, in front of the Royal Enclosure just to pay the respects of the R.A.F. Coast Patrols to the Prince of Wales.

Actually this all-too-brief appearance was very impressive. Even the most hardened of us seldom see the big flying-boats in formation. And certainly they are a pretty sight. Their lines are so much better and cleaner than those of the ordinary twin-engined land-going aeroplanes. In fact, one believes that the Southampton gets off the water quicker carrying a bigger useful load and flying faster than any land-going aircraft of the same power.

Considering that the boats had to come all the way from Calshot, they did pretty well in arriving at Hendon a bare three minutes late. That is the way the R.A.F. times things.

CONVERGING BOMBING.

Event No. 5 was an "Attack on an Encampment by a Single-Seat Fighter Squadron." This was a variant of the old "Bombing the Tank," originated ever so long ago by 25 Squadron from Hawkinge,—commonly known as Peck's Bad Boys. This time instead of a formation of five machines doing converging bombing on one tank, 41 Squadron, led by Sq. Ldr. R. S. Aitken, M.C., A.F.C., in Siskin Jaguars, bombed a machine-gun and encampment by flights.

Taking off in formation the three flights broke away to different points of the compass and then attacked so that while the first flight was leaving the target the second flight was making its attack and covering the retirement of the first, the third attack covering the second, and the first flight coming round in time to make a fourth attack and cover the third, and so-forth. Whether they were attacking in V or in line ahead formation this event was quite impressive and went off very well,—and so did the tents, which blazed beautifully.

(Jaguars) of No. 19 Fighter Squadron, Flying Officer W. J. H. Lindley and Sergeant C. G. Lott, was about the tamest event of the whole show. Having seen Sq. Ldr. de Haga Haig turning cartwheels and looping and spinning on a Bugle, and having seen Sq. Ldr. Longton do the same things slightly more rapidly on the slightly faster Bourges, and knowing that the Sidestrand is faster than either of them, or at any rate ought to be with its modern Jupiter engine, one did expect to see something like first-class flying. But the Sidestrand might have been an Argosy full of passengers for all the pilot did with it.

Even his descent in flames was no more than a mild and ladylike glide on a slightly circuitous path. The single-seaters hardly ever went within range of the bigger machine. Apparently they began loosing off at about 400 or 500 yards, instead of sitting on his tail at about 25. Perhaps they were told not to. The best thing in this event was the landing.

COMMUNICATIONS.

Event No. 7, "Message Picking Up" was one of the neatest shows of the Display. The picking up of messages on fishing-rods by Army Co-Operation machines, and the hurling forth of return messages, can never be made exactly spectacular. But the Armstrong-Whitworth Atlases (Jaguars) of No. 26 Army Co-Operation Squadron, Sq. Ldr. R. L. Stevenson, M.B.E., did the whole thing with such machine-like accuracy and *verve* and *aplomb*, and so forth, that it was really pretty to watch. Three machines came in together, picked up their messages together, wheeled round and delivered their messages together like one man and one machine. When they came in to deliver their returned messages the men in the gun-rings hurled out their message-bags with streamers attached so that they looked as if they were drilled dart-throwers, or Hannibal's Balearic slingers.

A LESSON TO YOUNG MOTHERS.

Event No. 8, "Flight Aerobatics," by instructors from the Central Flying School on De Havilland Moths with Genet engines, was one of the most perfect performances of the day. The Boyle-and-Atcherley partnership having been broken up by the Personnel Department, Air Ministry (Movements Sub-section), a new team of Moth-ers has been formed consisting of Flt. Lt. J. S. Chick, M.C., Fl. Off. D. A. Boyle and Fl. Off. W. E. P. Johnson. We have become more or less accustomed to Moths flying upside-down, or rather gliding upside-down, and once in a while a pilot gingerly goes round a curve upside-down. But these horrible people fly round in circles upside-down, and play follow-my-leader upside-down, and then they fly in formation with one upside-down and two upside-up, or two upside-down and one upside-up, till really, as the Babu said, "one doesn't know whether one is on one's topsy or on one's turvy."

After that the usual slow rolling and spinning, and so-forth, seems quite tame. And anyhow, being at Hendon, in front of the British Taxpayer, they do not cut the daisies on the aerodrome, or sweep the dust off the tarmac, with their wing-tips in rolling as they are reported to do at home.

Some solemn person asked the ridiculous G. D. what was the military utility of this inverted flying. To him G. D. answered brightly, "There *is* no military utility, but it's nice when it rains." Anyhow, one holds that inverted flying is not good for staid old fathers of families, even if they can still play Rugger.

A SPECTACLE.

Event No. 9, "Low Attacks by Day Bomber and Fighting Squadrons," is one of those events which is put in purely for effect. Actually it is only an example of good formation flying. But it does *pour épater les bourgeois*.

THE R.A.F.'s NEW FIGHTERS.—A Flight of Brist Bulldogs (Jupiter engine) of No. 3 (Fighter) Squadro
("Aeroplane" photograph.)

No. 12 Bomber Squadron, Fairey Foxes (some with Ro Royce Fs and some with Curtiss D.12s), under Sq. Ldr. T Salt, A.F.C., and No. 3 Fighter Squadron, Bristol Bulld (Jupiters), under Sq. Ldr. E. D. Johnson, A.F.C., came dc past the Royal Enclosure as the Assyrian came down lik wolf on the fold, except that the Assyrian, no matter h much of an ass he was, never made such a noise.

Though hardened by over 20 years of aviation one c fesses to being thrilled even now by the howl of those div Foxes. One is convinced that the sound of them al would be enough to quell any tribal war in five minu And no matter what alterations happen in the fashion aircraft in the future one holds that we shall have to a very long way before we produce an aeroplane so clas ally beautiful as is the Fox.

The Bulldog in its own class is a very fine aeroplane, in it we have what is, one believes, the finest machine the World for fighting at high levels. From 17,000 upwards the Bulldog is said to have not only the heels every other aeroplane, but also to have the manœuvrabi in that thin air. Not having been up there to see, one gi this as hearsay evidence, but it is quite reliable. And us the Bulldogs for ground-strafing was silly. The format should have been shown off in a high-speed supercha climb out of sight.

GLOOM.

Squadrons," had a solemnity all its own. In contrast with the silvery quick-moving Foxes and Bulldogs, the great dark night-birds looked almost like a funeral procession.

The machines were No. 7 Squadron (Vickers Virginias, Napier Lions), under Wing Commander E. R. Manning, D.S.O., M.C.; No. 10 Squadron (Handley Page Hyderabads, Napier Lions), under Wing Commander A. T. Whitelock, and No. 99 Squadron (Handley Page Hyderabads, Napier Lions), under Wing Commander B. E. Smythies, D.F.C. The take-off of these machines, which are somehow the aerial equi lent of the Army's tanks in their impressiveness, always g down well with the crowd. Having taken off, they tl disappeared in the distance and stopped there until th cue came for the Set-Piece.

THE CLOWNS.

FIGHTER FORMATIONS.—Three Squadrons of Fighters in the air at the R.A.F. Display at Hendon. They are No. 1 (F.) Squadron, No. 25 (F.) Squadron, and No. 43 (F.) Squadron, all flying Siskin IIIas with Jaguar engines.—(*"Aeroplane" photograph.*)

night bombers. Flg. Off. G. E. Campbell, D.F.M., and Flt. Serjt. Brown, winners of the competition between the Flying Training Schools of the Home Establishment, in Avros with Armstrong Siddeley Lynxes, showed themselves to be in the direct line of succession to Sq. Ldr. Jack Noakes and the late lamented Sq. Ldr. Longton. And having machines with better controls, and much better engines, and squdgier undercarriages they cavorted about the ground just like a couple of clowns at a circus.

A Mixed Grill.

Event No. 12 was an "Air Combat" in which a Sidestrand (Jupiter) of 101 Squadron piloted by Flg. Off. J. G. Elton escorted by three Siskins of No. 32 Squadron, piloted by Flg. Off. C. H. A. Colman, Plt. Off. J. A. Greenshields, and Flt. Lt. J. N. Boothman, was attacked by a single-seat fighter (also of 32 Squadron) in which was Flg. Off. H. W. Charnock. According to the programme the single-seater shot down one of the escort fighters, the Sidestrand and one of the other fighters proceeded on their way, and there was a fight between Flt. Lt. J. N. Boothman and Mr. Charnock. The fight was quite good stuff.

Squadron No. 101 have not had their Sidestrands lon and that may perhaps account for the fact that they see to be rather less agile in the air than the average Virgin or Hyderabad, and the Sidestrand's performance in th party was about as exciting as a cold tomato in a mixe grill.

Event No. 13 was a "Fly Past of Night Bombers" whic took off in Event 10. Just why it should appear in the pr gramme as a separate event is not very clear.

The Big Bangs.

Event No. 14 was the usual Air Battle and Set Piece an Blow-Up, with plenty of bangs and smoke and flame an steam, which really delights everybody and almost satisfie that primitive love of destruction which none of us eve outgrows.

This time the Set Piece represented a foreign port, t the extent of a quay with Custom House buildings and s forth at one end and a fort at the other. There was a troo transport alongside embarking troops and stores from lorri on a beautiful sea all made of blue (condemned) parachute which billowed elegantly in the wind.

OH! MONSTROUS!—Crazy flying by two pilots from No. 2 Flying Training School, Digby, at the R.A.F. Display on July 13.—(*"Aeroplane" photograph.*)

FRIGHTFULNESS.—Siddeley Siskins (Jaguar engine) of No. 41 (Fighter) Squadron, diving by Flights on the target of an encampment at Hendon on July 13.—(*"Aeroplane" photograph.*)

The first thing that happened was a British photographic reconnaissance machine, an Atlas piloted by Flg. Off. P. N. R. Halward, of No. 13 Sqdn., which came over the port and was attacked by Archie guns. The O.C. port then sent up a kite-balloon to look out for attacking machines—which on the face of it seemed a silly thing to do. But the programme included the supposition that certain of the British Forces were in a seaplane carrier, and that being so a kite-balloon would catch sight of the low hull of an aircraft-carrier quite a long way away.

A formation of Fairey Flycatchers (No. 405 Flight, Fleet Air Arm, under Flt. Lt. M. V. Ward) shot down the balloon and did some ground-strafing on the quay and on the transport. As they retired a Squadron of Siskins (No. 29, Sq. Ldr. M. L. Taylor, A.F.C.) dashed out in defence of the port and attacked a formation of British Bombers (No. 207 Squadron, Fairey IIIFs., Napier Lions, Sq. Ldr. E. A. Beaulah). After a little jousting between these two formations another enemy Squadron (No. 56, Siskins, Jaguar engines, Sq. Ldr. A. Lees) reinforced the port defences.

With them were mixed up No. 10 and No. 99 Night Bombers on Hyderabads under Wing Cdr. A. T. Whitelock and Wing Cdr. B. E. Smythies respectively. And the kite-balloon was under the command of Flt. Lt. C. W. Harrison, of the School of Balloon Training.

The Set Piece was built by a civilian contractor to a design submitted to and passed by the Display Committee. The lay-out and timing of the explosives was done by personnel of the Armament and Gunnery School, R.A.F., Eastchurch. The explosions were wired to an Eastchurch workshop lorry. The troops and dock hands were also Eastchurch personnel.

The blue waves lapping round the dock, which were so much admired, consisted of obsolete Michelin parachutes dyed blue and pegged to the ground.

This time the Set Piece went off to perfection. Sq. Ldr. Sandbags was not called upon to perform. Privately one heard that something had gone wrong with the release mechanism for the dummy. This was a pity, because the apocryphal Squadron Leader must by now have got so many Bars to his O.B.E. that he would have had to be promoted Wing Commander. Anyhow, when the kite-balloon was set on fire it did not set fire to anything else. It merely committed fell-in-the-sea,—as an Irishman once translated *felo de se*.

None of the bombs arrived before the machines which dropped them. When the bombs were supposed to fall in the water they created a splash and a fountain of mud and steam and liquid which indicated considerable excavations on the railway side of the aerodrome. And when the Custom House burned it suggested that it must have been used as a store for wood-alcohol by a boot-leg gang.

Altogether it was a most joyous proceeding. And when somebody remarked what a pity it was that we had no fast machines, as we had last year, to show our foreign visitors, a bright lad replied that we were keeping *that surprise* for the Solent in September. So that was that.

AND SO GOOD-NIGHT.

After which everybody went home. And as usual getting away took about eight times as long as getting in. There is in fact no way by which the clearing out of motor-cars can be improved. Even the worst of jambs does not really hold up anything, because as soon as a jamb occurs at one point the traffic on the outer roads is filled up by a spurt from another point.

And by now people know Hendon so well that they never

Digitized by Google

expect to get away for hours after the show is over. In fact if one is really in no sort of hurry there are very often better opportunities of meeting one's friends and having a chat after the show than before it. But waiting in a jamb to get away is sometimes a bit trying.

The heat and the glare on Saturday evening recalled that delightful story of the R.A.F. officer who, one or two Displays ago, is alleged to have sent in an application to the Air Ministry for field allowance, on the ground that he had spent the day at Hendon under canvas. Further inquiry discovered that the canvas to which he referred was the tent which sheltered the Bar in the R.A.F. enclosure.

Considering the topographical difficulties of Hendon the traffic was excellently handled both by the R.A.F. inside and by the police outside. The policemen had a particularly trying day sweltering in the sun from 08.00 hours till 20.00 hours and yet one never saw one of them looking other than good-natured, though many of them seemed to be on the verge of collapse.

Everybody concerned with the Display may well feel proud of themselves, from the Organising Committee all the way down through the Wing Commanders and the pilots and the mechanics of the Squadrons down to the apprentices who were selling programmes. The whole thing went without a hitch and was a splendid example of the all-round efficiency of the Royal Air Force.—C. G. G.

THE HESTON GARDEN PARTY.

Those who wish to entertain their friends, whether from overseas or not, will do well to remember the Aerial Garden Party at the Heston Air Park on Saturday next.

There will be an International Air Rally, organised by the Royal Aero Club, for which prizes will be given. Also there will be an International Aerobatics Competition, which will be followed by an Aerobatics Competition confined to Pilot Instructors of the Flying Clubs.

This will give all pilots a fine chance of showing their ability. And, given good weather, should provide everybody with a healthy afternoon in the country after stuffy days in the Show.

The Heston Air Park is now recognised as the Social Focus of British Aviation, and the best people go there as the done thing. Also the Air Park has been signally honoured by being made a temporary Customs Aerodrome by the Government,—which will be handy for foreign visitors.—C. G. G.

FOR CROSS-CHANNEL VISITORS.

All those who intend flying to the Aero Show from the Continent should take note that the Air Ministry has issued the following Notice No. 38 of the year 1929 to Airmen:—

1. Heston Aerodrome, Hounslow, Middlesex, is, with the concurrence of the Commissioners of Customs and Excise, approved as a Customs Aerodrome under paragraph 2 of Schedule VIII to the Air Navigation (Consolidation) Order, 1923.

2. The necessary Directions under the above-mentioned Order will be published in due course as the Air Navigation Directions, 1929 (A.N.D. 4) which will come into operation on the 9th July, 1929, and will cease to be in force on the 3rd August, 1929.

This means that for the duration of the Show and afterwards until Aug. 3, intending visitors can fly straight to London and land at Heston without having to pass the Customs at Lympne or Croydon.

DEMONSTRATIONS AT HESTON.

During the Aero Show a number of aircraft will be available at Heston Aerodrome for demonstration purposes.

Amongst these will be the Junkers K.37, a three-seat twin engined fighter, the Junkers K.47, a two-seat high-performance fighter, and the new Junkers F.13, a passenger limousine.

The Westland Works are having three machines there and these will be a Westland IV, a Wapiti-Jaguar, and a Widgeon.

The Glenny and Henderson Gadfly will be demonstrating the new Pearson rotary ailerons.

The Blackburn Company have brought down a Lincoln and a Bluebird.

George Parnall and Co. have sent up their new two-seat light aeroplane, the Elf, with the Hermes engine.

A new firm, the Civilian Aircraft Co., are demonstrating their new two-seat coupé monoplane with an A.B.C. Hornet engine.

The D.H. Hawk-Moth will also be available for purposes of demonstration.

MORE INHABITANTS FOR HESTON.

Auto-Auctions Ltd., whose new premises at the corner of Old Burlington Street and Burlington Gardens were illustrated in THE AEROPLANE recently, have now acquired accommodation at the Heston Air-Park, which was officially opened by Lord Thomson, the Secretary of State for Air, on Saturday last before the finish of the King's Cup Race.

Auto-Auctions Ltd., having acquired the World-wide distribution rights of the Blackburn Bluebird side-by-side light aeroplane, are now able to offer customers a full course of instruction at the Heston Air-Park.

THE CHANNEL ACCIDENT.

The Air Ministry Report of the formal investigation of the accident to the Imperial Airways aircraft G-EBMM at sea on June 17, 1929, held under the Air Navigation (Investigation of Accidents) Regulations, 1929, was published on July 16.

The whole subject will be discussed fully in THE AEROPLANE when people's minds are free from Show interests and are able to give proper attention to the subject.—C. G. G.

A SUCCESS AT COWES.

The many friends in British Aviation of S. E. Saunders, Ltd., as now composed of Mr. S. E. Saunders, Sir Alliott Roe, and Mr. John Lord, will be glad to hear that the first combined effort of the firm has proved a success. The four seater cabin flying-boat, details of which were published in the special Aero Show issue of THE AEROPLANE, made its first test flights on Thursday, July 4. (The Cutty Sark).

The weather was far from ideal as there was a strong wind with gusts up to 30 miles an hour, but Mr. Chilton, Flg. Off., R.A.F., who piloted the machine, reported it as most satisfactory to handle. Thanks possibly to the strong wind the machine left the water in somewhere between 5 and 6 seconds, which however indicates that even in a flat calm the get-off would be quite good. In spite of the severe sea conditions the hull proved remarkably clean, the machine sitting well back so that the spray was clear of the cabin and air-screws. Mr. H. Knowler, the designer, deserves to be congratulated on his work.

ON THE SCHNEIDER COURSE.

In *The Daily Telegraph* of July 10 the following appears:

The Aviation Correspondent of *The Daily Telegraph* writes:—

The course for the race for the Schneider Maritime Trophy, to be flown for in the international contest in the Solent on Sept. 6-7, has been the subject of an attack in an aeronautical journal, in which it is suggested that the course was chosen largely with regard to the convenience of spectators and others.

The course as chosen has been approved by the Royal Aero Club, but the club did not select the course. Selection rested upon experts, among whom were a Royal Air Force officer with great experience of seaplanes and the members of the British Schneider Cup team themselves.

It may be pointed out that an extension of the course eastwards would have much increased the chance of rough water and consequent postponements, while an extension at the western end, or a change of direction towards the north-west at that end, would also have gone beyond waters which enjoy a certain amount of shelter. The course has been inspected by Italian officers and approved by them.

No consideration except that of the race itself was entertained by the experts. There are many parts of the coast where a larger number of spectators could have been disposed, but there is no reason to believe that the arrangements which are being made for transport and catering will prove less than the best possible in the circumstances.

The foregoing article can only be described as what the late Victorians used to call a "farrago of nonsense."

The first paragraph is diametrically opposed to the truth. The suggestion in THE AEROPLANE was distinctly that the course was chosen entirely *without* regard to the convenience of the spectators,—namely, the British Public, who have to pay all the costs of the contest.

The second paragraph is equally unlikely to inspire confidence in the course. The fact that it has been selected by experts is the best possible reason for believing that it is wrong. So far as the members of the Schneider team are concerned, they would naturally assent to any good course, and could not be expected to consider the interests of the spectators. Nobody denies that the course chosen is good for flying. But one states definitely that the course suggested in THE AEROPLANE is as good for flying, and perhaps a trifle better, and is immeasurably better if the spectators are to be considered as they should be.

MATTERS OF GEOGRAPHY.

So far as the third paragraph is concerned, no suggestion was made in THE AEROPLANE that the course should be *extended* eastward. One eastward turning-point suggested in THE AEROPLANE is a trifle to the east of the turning-point at present chosen. But it is also further north, and therefore more within the shelter of Hayling Island if there should be a strong east wind on the day of the Contest.

The change of direction suggested in THE AEROPLANE to the westward would definitely *not* bring the course into unsheltered water. On the contrary, it would take the turning-point away from its present position exactly in the neck of the channel between the Isle of Wight and the New Forest, where it is exposed to every wind, especially the prevailing south-west wind, and would bring both the inward and outward leg of that part of the course over the most sheltered water in the Solent.

As a matter of fact, so far as the pilots themselves are concerned, the positions of the turning-points hardly matter. If their machines are going to break down they are no more likely to break down on the turn than anywhere else, and if they are going to break down on the turns the present turning points are just a trifle more dangerous than the turning points which are suggested in the revised course suggested in THE AEROPLANE.

The statement that the course has been inspected by Italian officers and approved by them is purely a politicians' argument,—an endeavour to drag our sportsmanlike competitors in as support to a silly mistake made by our self-appointed experts.

Italian officers taken on a trip to the Solent, and possibly flown over the course once, would have no opportunity of studying the course in detail. They would have to know the Solent thoroughly before they were competent to express an opinion. The best they could do would be to *approve* the course, as stated in *The Telegraph*, to the extent that they could see nothing objectionable about it.

But that does not in the least mean that having read the recent article in THE AEROPLANE the Italian and other foreign competitors have not formed an entirely different opinion now that the folly of the chosen course has been pointed out.

THE BIG-SHIP CHANNEL.

There is one apparently valid objection to the revised course suggested in THE AEROPLANE which the writer in *The Daily Telegraph* has not mentioned,—which is that a channel must be kept clear for big ships coming into Southampton Water from the English Channel by the Needles. The westerly turning point fixed in the middle of the Solent apparently (but only apparently) takes the course clear of this channel, whereas taking the course across to Calshot brings it across this channel,—which looks bad on paper.

As a matter of fact this objection is not valid either, for the channel allowed at present for big ships coming in from the East crosses the chosen course twice.

There are, according to the present plans, certain lanes cut across the course which will be kept clear of water-borne traffic by Admiralty patrols,—so as to provide an alighting space for the competing machines in case of trouble. The provision of a lane for shipping up to Southampton Water from the Channel would merely provide another such open space. It would involve no more trouble for the patrol boats, because in any case the pleasure-boats along the course near the west turning point will have to keep out of the big ships' course.

If a machine approaching the western turning point went wrong, with the course as at present chosen, it would alight perforce in the big-ship course as at present arranged,—and might well have to come down in rough water. If it went wrong when approaching Calshot on the course suggested in THE AEROPLANE, it would have a good sporting chance of alighting on the permanently smooth surface of Southampton Water, which would then be only a little to the north of the course.

TRANSPORT AND MAINTENANCE.

The final statement to the effect that the arrangements which are being made for transport and catering will be adequate is on a par with the rest.

If people want to see the race in comfort, as at present arranged, they will have to give up three or four days to go to the Isle of Wight and back and they will have to submit to being robbed while they are there. Alternatively, they will have to be crushed in a mob at Southsea or Stokes Bay. If the course suggested in THE AEROPLANE were adopted there would be heaps of room for people all along the north coast of the Solent and for tens of thousands more on the shore round about Calshot,—within reasonable reach of food and shelter under reasonable conditions.

From a flying point of view the course suggested in THE AEROPLANE has distinct advantages over the course chosen by the so-called experts, and from the point of view of the British Public who are paying for the race, and of foreign visitors who want to see it, the course suggested in THE AEROPLANE is immeasurably better than that chosen by the Royal Aero Club and the people whom the Club choose to regard as experts.

The Aviation Correspondent of *The Daily Telegraph* as a rule is Major C. C. Turner. If Major Turner wrote that article then he has evidently been persuaded by the experts of the Royal Aero Club without having given enough personal attention either to the course or to the article in THE AEROPLANE which he has taken upon himself to criticise. And in any case, whoever wrote the article, it is too obviously a mere defence of the Aero Club without consideration for the British public.—C. G. G.

GLO

KING'S CUP, 1929.

WINNER AND FASTEST TIME.

Pilot—
Flying Officer R. L R. Atcherley.
Navigator—
Flight Lt. G. H. Stainforth.
Entrant—
Sir Walter Preston, M.P.

The machine was a standard Two-SEATER "Grebe," as used for training Scout Pilots, with standard Siddeley "Jaguar" Engine.

Extract from "Observer," 7/7/29.

"The winner's average speed over the whole course of 1,176 miles was 150.3 miles per hour.

This is a record for the King's Cup."

Extract from "Daily Telegraph," 8/7/29.

"The incredible had happened, and the Grebe, which had been forty-two minutes behind the leader at Leeds, and twenty-seven minutes behind him at Birmingham, had overtaken him and four others in the last short lap."

Fighter.

"The war gave Gloucestershire a new industry, which has remained with it, and has of late seen notable developments. Here, in the heart of a beautiful country under the green rolling Cotswolds, metal wings for many types of aeroplanes besides the well-known 'Glosters' are made. . . . The inside of the Gloster factory is exceptionally interesting because of the great variety of types seen in various stages of construction, and because of the big batches of wings for types not designed nor erected here. Almost endless strips of high tensile steel are to be seen passing into huge machines and emerging with rolled top and bottom flanges. They are used for building up light but immensely strong wing spars."—*Daily Telegraph.*

THE OPENING OF THE AERO SHOW.

The Seventh International Aero Exhibition at Olympia was opened on July 16 by His Royal Highness the Prince of Wales. Strange to say, practically every stand was ready in time for the opening and hardly any aircraft remained to be built during the following night

The arrival of invited guests was made a trifle difficult by the fact that the invitations expressly pointed to the main entrance in Hammersmith Road as being the place at which to arrive, and on arriving there (at any rate up to 11.45 hours) the guests were faced by locked shutters over which was a notice saying "Invitations this way." Exhibitors naturally penetrated by back ways. But presumably guests queued-up till the doors were opened somewhere about mid-day.

His Royal Highness the Prince of Wales arrived shortly after 12.00 hours and was conducted round the Exhibition by the Council of the Society of British Aircraft Constructors,—so effectually that when the French Ambassador and the Air Council and the higher officers of the Royal Air Force arrived there was nobody left to receive them.

However, ultimately a vast concourse sat down to an excellent Lyons lunch, in which the healths of the King and of the Prince of Wales and of the rest of the Royal Family were proposed, in accord with the most modern custom, in the middle of lunch, so that people could begin smoking.

HIS ROYAL HIGHNESS THE PRINCE OF WALES, proposing the Toast of Success to the Exhibition, said that he felt that it was a great privilege to open this International Aviation Exhibition. Those present would be pleased to know that before coming to Olympia he had had ten minutes' conversation with the King and that His Majesty had expressed his pleasure at his coming to open the Exhibition.

He then apologised for being late for lunch (13.45 hours instead of 13.00 hours) and told the Committee that they shouldn't have made the show so interesting. He simply couldn't tear himself away.

The exhibition, he said, was a powerful reminder of the progress of late years and it was a source of great encouragement to people like himself who were intensely interested in aviation.

This was the seventh Aero-Show to be held in the City of London, and it was the largest and most comprehensive ever held in the World.

He was glad of the opportunity of welcoming the representatives of so many countries. The Srow was indeed international. There were trade exhibits from the United States, France, Germany, Italy, Sweden, Czechoslovakia and Austria,—besides official exhibits from France, Germany, Italy and Austria.

He said that the whole of the British Aircraft Industry extended a hearty welcome to the diplomatic and other representatives of foreign nations. He was glad to see present the French and German Ambassadors and the Ministers of Sweden and Austria, and he much regretted the absence of the Ambassadors of the United States and Italy.

The Society of British Aircraft Constructors, he said, looked forward to extending all possible hospitality to visitors from all countries and hoped that such visitors would take away pleasant memories.

The Prince pointed out that this was a particularly appropriate time for an Aero Show. Last September saw the twenty-fifth anniversary of the first flight by the Wrights. This July would see the twentieth anniversary of the crossing of the Channel by Blériot, and that we all hoped to welcome M. Blériot in person on that anniversary. This year also celebrated the tenth anniversary of the first Atlantic flight by a U.S. Naval flying boat and by a British aeroplane and by a British airship.

The progress of aviation throughout these years was so well demonstrated by the Air Ministry exhibit in the gallery.

Everything encouraged a belief in the rapid future advance of flying. Aviation had now come right into our lives.

He congratulated heartily the Organising Committee of the Show and the Chairman, and said that all the things that had made him late for lunch were evidence of the ability of our aircraft constructors. He then declared the Exhibition open.

CAPT. P. D. ACLAND, Chairman of the S.B.A.C., replying, said that he wished to express on behalf of the British Aeronautical Community and their many welcome guests from overseas their thanks to His Royal Highness for his words and for opening the Show.

THE NEW HALL AT OLYMPIA.—"The Aeroplane" stand is by the tail of the big Ford Tri-Motor in the far corner, in the middle of the picture. In the foreground is the Gloster Survey biplane (Jupiters) built for the Aircraft Operating Co. Ltd. The cabin of the Handley Page liner is in the middle.

Fit "TripleX" Regd

"Triplex" -and be safe!

Triplex is fitted as standard to most modern cars, and wherever there is danger from flying glass. Triplex goggles are a vital necessity when flying to-day.

Make sure it's Triplex; Look for the three X's in a circle; This Trade Mark is on all Genuine Triplex Glass.

AERO EXHIBITION STAND 24

TRIPLEX SAFETY GLASS Co., Ltd., 1, Albemarle St., London, W.1.

Digitized by Google

We all knew the great interest which His Royal Highness took in this new Art of Aviation, and the practical part which he played in it. His actions were evidence of that sympathy which our Royal House showed in all activities in our great Commonwealth.

The steps which aviation had made in recent years were all the result of advance in technique. Flying was at last becoming part of our lives and aircraft were becoming better instruments of communication.

The moment was now appropriate to show the British public the progress which we were making. He felt sure that he would give no offence to our visitors if, speaking for British constructors, he said that in no respect could British aircraft be excelled. We were glad to see so many exhibitors from foreign nations. We welcomed competition and hoped that the best man might succeed. The Prince of Wales had given the Show a splendid start and his action would encourage the British public to come and study this great new industry.

With that the lunch party dispersed and the Trade returned to their stalls or stands to await the hoped-for onslaught of the Public, while the present writer fled Cityward to get these few notes into the paper.

Next week a critical review of the aircraft at Olympia will be published, supplementing the specifications and illustrations which were published in the Special Issue of July 12. All that is necessary to say now is that there is a vast amount of intensely interesting material in the Show and that anybody who is really interested in flying should spend at least three whole days studying all the exhibits in detail.

As Capt. Acland said, in no respect can British aircraft be excelled. But there are among the foreign exhibits many ideas which suggest ways in which better and better aircraft can be designed or built. And some of the greatest ideas shown by British exhibitors are stowed away in comparatively small stalls in or under the galleries.

Every reader of this paper should visit the Show as often as possible and should make an effort to bring with him or her somebody else who had not as yet taken a lively interest in flying. By taking a few proselytes to Olympia during this week and next, and by making up parties to go to the Aerial Garden Party at Heston Air-Park on Saturday, where a number of the World's best pilots will be seen at play in the air, every reader may do really good work for the progress of aviation and so for the aerial supremacy of this comic country.—C. G. G.

THE FRENCH SCHNEIDER COMPETITORS.

Photographs of the Bernard racing seaplane, two of which are being built to compete in the Schneider Trophy Contest, have already appeared in the French press. They are similar in general appearance to the Short Crusader which was built for the Schneider Contest in 1927, and will have Gnôme-Rhône geared radial air-cooled engines of new design known as the Mistral, which are expected to give 1,200 h.p. One of the two machines will use the N.A.C.A. radial engine cowling.

The fuselage is of the fish-like section which has become classic for Schneider aircraft, with the pilot's cockpit over the trailing-edge of the wing, a streamline windscreen running forward to the engine and a long head-rest behind running into the vertical fin aft.

The monoplane wings are mounted on the thrust line and are wire-braced to the top of the fuselage and the floats.

The floats are of the long, single-step streamline type and are attached to the fuselage by two streamlined "N" type struts. The gaps between the front two legs of the "Ns" are filled in, and each makes what looks like one deep leg.

The tops of these struts do not meet on the centre-line of the underside of the fuselage as in previous Curtiss, Supermarine and Gloster aircraft but merge into the fuselage some distance apart at what would be the bottom longerons in a normal fuselage. The floats are interconnected by two streamline wires.

Little is known about the Nieuport-Delage machines, which are to be fitted with Hispano-Suiza inverted "T" type engines, except that the engines will be cooled with the new ethylene-glycol fluid developed by the Material Division, U.S. Army Air Corps.

This fluid has a boiling point of 388 degrees F. and the temperature found most suitable at which to operate an engine using this fluid is 300 degrees F. The radiator required to cool an engine operating at this temperature is approximately one-fourth the size of one required to cool the same engine producing the same horse-power when using water as a cooling liquid and operating at normal temperature.

The French Government are to be congratulated on making so prompt a use of the two most outstanding recent American developments.—L. B.

THE ROYAL AIR FORCE.

The London Gazette.

July 9.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following are granted S.S. comns. as Plt. Offs. on probation with effect from and with seniority of June 28:—G. E. Agard-Butler, N. Alexander, F. C. Allen, C. A. Ball, G. Bearne, G. Calvert, N. J. Capper, D. I. Carlyle, I. A. Critchley, C. H. Glover, D. H. A. Golege-Steel, W. E. Grant, D. C. Harrison, W. J. Hodge, A. H. Houghton, G. M. Ievers, F. J. B. Keast, D. W. Lydall, I. L. S. McNicol, C. W. Marriott, T. G. Melior, C. E. Morse, J. T. Mynors, B. Paddon, H. G. J. Purcell, N. Stratton, J. M. Waddell, G. N. Warrington, G. E. S. Williams, S. N. Wiltshire.

The following Plt. Offs. are promoted to the rank of Flg. Off.:—A. D. Bennett (with seniority of Mar. 2) (Mar. 7); N. F. V. Henkel (June 8); D. J. Waghorn, N. A. Tait, W. H. Hutton, J. R. H. Pott, W. K. Beisiegel (June 17); H. Bailey, V. S. Bowling, N. W. Creasy, I. D. Elliott, W. R. Tope (June 30).

Flg. Off. A. W. Elias takes rank and precedence as if his appointment as Flg. Off. bore date Jan. 31, 1927—reduction takes effect from June 20, 1929; Flg. Off. M. H. Clare takes rank and precedence as if his appointment as Flg. Off. bore date May 9, 1929—reduction takes effect from May 16, 1929; Plt. Off. H. R. Dale takes rank and precedence as if his appointment as Plt. Off. bore date Feb. 22, 1929, immediately following Plt. Off. A. F. C. Booth on the gradation list—reduction takes effect from May 24, 1929.

Flg. Off. E. Whittlesea, M.B.E., is placed on the retired list (July 6); Flg. Off. H. J. Usher is placed on the retired list on account of ill-health (July 10).

The following Flg. Offs. are transferred to the Reserve (July 8):—CLASS A.—C. H. Morgan, J. E. Davies, R. W. Steele, A. J. Thompson, W. E. Gray, E. L. Leader, W. A. Cooke. CLASS C.—L. A. Egglesfield, E. Walker.

Flg. Off. B. B. Dowling (Lt., Manch. R., R.A.R.O.) relinquishes his S.S. comn. on account of ill-health (July 8). The S.S. comns. of the following Plt. Offs. on probation are terminated on cessation of duty:—I. M. L. Kat Ferreira (June 29); E. G. Hucker (July 6). Plt. Off. on probation C. H. Robbins is dismissed the Service by sentence of General Court Martial (June 29).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation:—R. G. Shaw (June 21); W. Clarke (June 24); I. B. Sherring, L. Swan (June 26); K. Shenstone, E. S. Kennedy (June 27). The following Plt. Offs. on probation are confirmed in rank:—J. G. Naz, E. W. Seymour-Hosley (June 29); J. L. Browne, W. W. L. Jones (July 2); J. W. Carmichael (July 9). Plt. Off. J. A. Hall of the Special Reserve is promoted to the rank of Flg. Off. (June 11). The following are transferred from Class A. to Class C:—Flt. Lt. R. A. Birkbeck, D.F.C. (May 12); Flg. Off. G. C. Lugg (Mar. 13). The following Flg. Offs. relinquish their comns. on account of ill-health and are permitted to retain their rank:—S. A. Lane (July 10); D. E. B. Clark (July 3). Flg. Off. A. L. Monger is dismissed the Service by sentence of General Court-martial (June 6).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 602 (CITY OF GLASGOW) (BOMBER) SQUADRON.—The following to be Plt. Off.:—F. G. Murray (May 29).

No. 603 (CITY OF EDINBURGH) (BOMBER) SQUADRON.—The following Plt. Offs. to be Flg. Offs.:—J. M. Fosbrooke (Nov. 30, 1928); I. E. C. Watson (Jan. 22).

MEDICAL BRANCH.—No. 605 (COUNTY OF WARWICK) (BOMBER) SQUADRON.—The following Flg. Off. to be Flt. Lt.:—J. S. Jerome, M.C., M.A., B.M. (July 5).

PRINCESS MARY'S R.A.F. NURSING SERVICE.

The following are appointed to the permanent service (July 1):—SISTERS.—Miss E. E. Horsford, Miss E. M. Murphy, Miss H. Adams. STAFF NURSE.—Miss G. F. H. Lloyd.

Appointments.

Week ending July 15.

GENERAL DUTIES BRANCH.—Group Captain H. R. Busteed, O.B.E., A.F.C., to R.A.F. Reception Depot, West Drayton, to command, 4/7.

Squadron Leader F. E. Hellyer, O.B.E., to H.Q., Coastal Area, 8/7.

Flight Lieutenants C. E. Maitland, D.F.C., to Experimental Section, R.A.E., S. Farnborough, 24/6. H. A. L. Pattison, to R.A.F. College, Cranwell, 29/6. H. G. P. Ovenden, to No. 216 Sqdn., Middle East, 17/6. J. W. Colquhoun, to H.M.S. *Hermes*, 13/5. C. E. H. Allen, D.F.C., to Cambridge University Air Sqdn., 8/7.

Flying Officers W. J. Coadwell, D.S.M., to Aircraft Depot, 'Iraq, 5/6. W. G. Campbell, to Home Aircraft Depot, Henlow, 6/6. D. G. Walker, to Home Aircraft Depot, Henlow, 25/6. J. H. Pool, to Home Aircraft Depot, Henlow, 3/7. H. M. S. Wright, J. M. Cohu, A. W. B. McDonald and G. B. M. Rhind, all to Cambridge University Air Sqdn., 8/7. D. D. M. Eastwood, to No. 4 Stores Depot, Ruislip, 6/6. (Hon. Flt. Lt.) L. P. Winters, to No. 501 Sqdn., Filton, 3/7. D. J. Waghorn, to No. 408 (F.F.) Flight, 21/6. C. H. Johnson, to R.A.F.M.T. Depot, Shrewsbury, 15/7. C. W. L. Trusk, A.F.C., to Home Aircraft Depot, Henlow, 1/7. R. J. Carvell, to Home Aircraft Depot, Henlow, 8/6. P. C. Fair, to No. 446 (F.S.R.) Flight, 5/7. G. N. S. Lane, to H.Q., Coastal Area, 1/7.

Pilot Officers D. R. S. Freestone, to No. 3 F.T.S., Grantham, 17/6, on appointment to a Perm. Comn. (on probation). E. Coleman, D.F.M., to R.A.F. College, Cranwell, 17/6, on appointment to a Perm. Comn. (on probation). H. E. Dicken, to No. 35 Sqdn., Bircham Newton, 17/6, on appointment to a Perm. Comn. (on probation). P. J. Connolly, to No. 47 Sqdn., Middle East, 19/6. P. J. J. Cullinan, G. A. E. Harkness, and R. Louis, to No. 70 Sqdn., 'Iraq, 13/6. J. C. Harcombe, to No. 55 Sqdn., 'Iraq, 13/6. E. C. Passmore, to No. 30 Sqdn., 'Iraq, 13/6. J. R. Robins, to No. 84 Sqdn., 'Iraq, 13/6.

MEDICAL BRANCH.—Squadron Leaders R. W. Ryan, M.B., to H.Q., No. 1 Air Defence Group, Sloane Street, S.W., 26/7. E. A. Lumley, M.C., M.B., to H.Q., A.D.G.B., 1/8. T. J. Thomas, M.B., to Central Medical Establishment, Clement's Inn, 22/7.

Flying Officers C. Crowley, M.B., to Medical Training Depot, Halton, 2/7. H. C. S. Pimblett, M.B., to Medical Training Depot, Halton, on appointment to a S.S. Comn., 2/7.

STORES BRANCH.—Flight Lieutenant H. J. Barnham, to Station H.Q., Duxford, 14/6.

Flying Officer B. E. Essex, to R.A.F. Base, Malta, 5/7.

ACCOUNTANT BRANCH.—Flying Officer R. J. Wishlade, to R.A.F. Depot, Uxbridge, 1/7.

CHAPLAINS BRANCH.—The Rev. T. A. P. King, to R.A.F. Depot, Uxbridge, on appointment to a S.S. Comn., 3/7.

The Higher Command.

The Air Ministry announces the following appointments:—

Air Vice-Marshal F. R. Scarlett, C.B., D.S.O., now Air Officer Commanding, Fighting Area, Air Defence of Great Britain, to command the Royal Air Force in the Middle East in November next vice Air Vice-Marshal T. I. Webb-Bowen, C.B., C.M.G., on termination of his three years' appointment.

Air Vice-Marshal H. C. T. Dowding, C.B., C.M.G., now Director of Training, Air Ministry, to command the Fighting Area, Air Defence of Great Britain, in November next.

Air Vice-Marshal A. E. Borton, C.B., C.M.G., D.S.O., A.F.C., now Director of Personal Services, Air Ministry, to command the Inland Area, Royal Air Force, in November next, vice Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C., on termination of his three years' appointment.

A Royal Investiture.

His Royal Highness the Prince of Wales held an investiture at St. James's Palace on behalf of the King on July 9.

Among those in attendance upon His Royal Highness was Air Chief-Marshal Sir John Salmond (Principal Air Aide-de-

A FAST FIGHTER.—The Westland Wizard II single-seat fighter monoplane (Rolls-Royce F.XIs engine), which has a high performance at altitude with a low landing speed.

Camp). Group Capt. R. Peel Ross (Aide-de-Camp-in-Waiting) was also present.

The following were among those introduced into the presence of the Prince of Wales, when His Royal Highness invested them on behalf of the King with the respective divisions of the Orders into which they have been admitted:

The Most Excellent Order of the British Empire.—Civil Division, Dame Grand Cross: Professor Dame Helen Gwynne-Vaughan.

The Most Honourable Order of the Bath.—Companion, Military Division: Air Commodore Cyril Newall.

The Most Excellent Order of the British Empire.—(Military Division), Officers: Wing Cdr. Edgar Huntley, R.A.F., and Sq. Ldr. Robert Oxland, R.A.F. Members: S-M. Charles Goodchild, R.A.F.; S-M. Francis Parker, R.A.F., and S-M. Charles Turner, R.A.F.

The Prince of Wales, on behalf of His Majesty, then conferred decorations as follows:—

The Distinguished Flying Cross.—Received a Second Bar: Sq. Ldr. Harold Whistler, R.A.F.

The Air Force Cross.—Flg. Off. Ardley Pickering, R.A.F., and Flg. Off. Claude Trusk, R.A.F.

The Medal of the Military Division of the Most Excellent Order of the British Empire.—For Gallantry: Flg. Off. Walter Anderson, R.A.F., and Cpl. Thomas McTeague, R.A.F.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident near Trowbridge to an Avro machine of No. 1 Flying Training School, Netheravon, on July 11, Plt. Off. Reginald Montague Swaine, the pilot and sole occupant of the aircraft, was killed.

Vacancies for Apprentice Clerks.

The Air Ministry announces that sixty vacancies exist in the R.A.F. for well-educated boys, between the ages of 15½ and 17, to enter as apprentice clerks. Thirty vacancies will be filled in October next and 30 in January, 1930. Some of the posts will be filled by means of an open competition which will be held by the Civil Service Commissioners in October at various centres (for entry in January, 1930) and the remainder by direct entry of boys who have obtained an approved school certificate. Successful candidates will be required to complete, in addition to the training period, 12 years' Regular Air Force service after reaching the age of 18. At the age of 30 they may return to civil life or may be permitted to re-engage to complete time for pension.

Detailed information regarding the apprentice clerk scheme can be obtained from the Royal Air Force, Gwydyr House, Whitehall, S.W.1.

The Premier and Service Air Transport.

In the House of Commons on July 10, Capt. Crookshank asked the Under-Secretary of State for Air if he would state what were the regulations in force regarding the use of military aeroplanes by civilians other than those connected with the Air Ministry; whether any charge was made for the use of such aeroplanes and if so what were the rates?

The Under-Secretary of State for Air said that the use of military aeroplanes by civilians other than those connected with the Air Ministry was regulated in accordance with paragraph 797 of the King's Regulations for the Royal Air Force which provided *inter alia* for the conveyance of "persons of distinction in the public service to any part of the British Empire or of any friendly Power" in cases in which the responsible authority was "satisfied that the public interest would be promoted by the grant of flying facilities." In this country such flights were only authorised by the Air Ministry, while overseas the personal authority of an air or other officer commanding was required. The answer to the second part of the question was in the negative and the third part did not therefore arise.

Capt. Crookshank asked whether it was a fact that a Service aeroplane had been used on July 6 to take a member of the Government to a political demonstration at Durham?

Mr. Montague said that the object of the flight was not to enable the Prime Minister to attend a party gathering but to curtail his absence from the seat of Government.

Capt. Gunston asked whether there was any precedent for a Minister using a Service aeroplane for party meetings, to fly to a political demonstration? If the Prime Minister was so pressed for time why could he not hire a private aeroplane?

Mr. Montague said that the aeroplane did not go within 30 miles of the function concerned and it was necessary to take that form of transport in order that the Prime Minister should fulfil an engagement in the public service.

Capt. Crookshank gave notice that in view of the unsatisfactory nature of the replies he would raise the question on the Adjournment. On re-opening the question he said that the question arose out of the Prime Minister's use of a Service aeroplane on July 6 in order to go to Durham to take part in a political demonstration. He would like a further explanation of how the Air Ministry could satisfy itself or the Air Council, which had nothing to do with politics, could satisfy itself that the public interest would be promoted by the presence of the Prime Minister at a purely party demonstration. What he and the general public wanted an explanation about was this:—Granted that it was necessary for pilots to receive their training, granted that the expense to the State was not overwhelmingly large, granted that the Prime Minister had to be in London on Friday night and

Sunday morning, the question to which he required an answer was, "As he had to go by aeroplane why could he not go in a civil machine? Why did he have to call upon the Royal Air Force to supply him with a machine when the Regulations of the Air Force state that they are to be provided only when the public interest will be promoted? How can the public interest in the general sense be promoted by either the Prime Minister or anyone else of any party attending a purely party demonstration."

Mr. Montague said that he was going to take the position that if there was any citizen of this country who had the right to the use of a Service aeroplane it was the Prime Minister. If the Prime Minister wanted to use a civil aeroplane he might have used a dozen quite easily. The question was one of facility and convenience.

Sir Samuel Hoare said that he should be the last Member of the House to blame the Prime Minister or any Member on the front Bench for flying on his official duties. He (Sir Samuel Hoare) had flown between 40,000 and 50,000 miles on his official duties during the last Parliament. They did not criticise the Prime Minister for flying upon his official duties but he was genuinely sorry that a military machine should have been used to take any Minister to a party meeting and he would suggest to the Prime Minister—who took a very great interest in the Air Force and the development of flying generally—that it would be much better if, on a similar occasion in future, he flew in a civil machine.

Inter-Service Polo.

The annual Polo match between the Royal Navy and the R.A.F. for the Duke of York's Challenge Cup was played at Ranelagh on July 11.

The R.A.F. received a handicap of 2½ goals and won the match by 7½ to 5 goals. The Air Force opened the scoring with a goal by Flt. Lt. A. B. Ellwood. Shortly after Lt. Cdr. Lord Louis Mountbatten hit a goal for the Navy. Early in the second chukka Sq. Ldr. the Rev. M. Beauchamp put the Air Force further ahead. During a noisy but unproductive bit of play Lt.-Cdr. C. R. W. Gairdner's pony bolted with him and leaving the ground dashed under some trees and threw his rider. Lt.-Cdr. Gairdner was stunned and broke two ribs. After a short delay his place was taken by Admiral Sir Roger Keyes. The Navy improved in the next two chukkas and hit three goals to the Air Force one. The fifth chukka was all Air Force and at the end of it they were leading by 7½ to 4. Both teams were pretty well played out when the Navy hit their fifth and last goal. The teams were:—R.A.F.: 1, Sq. Ldr. the Rev. M. Beauchamp; 2, Sq. Ldr. A. Coningham; 3, Flt. Lt. A. B. Ellwood; back, Sq. Ldr. W. de W. Waller. R.N.: 1, Lt. Cdr. C. R. W. Gairdner (Admiral Sir Roger Keyes); 2, Lt. Cdr. Lord Louis Mountbatten; 3, Cdr. E. G. Hastings; back, Lt. W. Eykyn.

The Duke of York's Cup was presented to the winners by Lady Keyes.—C. M. MCA.

THE R.A.F. ANNUAL DINNER.

The tenth annual dinner of the R.A.F. Dinner Club, founded in 1919 by Wing Cdr. W. G. Christie, C.M.G., D.S.O., M.C., and the late Sq. Ldr. Vivian Robeson, D.S.O., was held on Friday, July 12, the eve of the R.A.F. Display, at the Connaught Rooms. His Royal Highness the Prince of Wales was the guest of the evening. Sir Samuel Hoare, late Secretary of State for Air, was an honoured guest. Marshal of the Royal Air Force Sir Hugh Trenchard, Bart., G.C.B., D.S.O., was in the chair. Among those present were:—

Air Chief Marshal Sir John Salmond.

Air Marshals Sir John Higgins and Sir W. H. G. Salmond.

Air Vice-Marshals C. L. Lambe, C. Longcroft, Sir Oliver Swann, Sir Philip Game, Sir Vyell Vyvyan.

Air Commodores Bowhill, the Hon. J. D. Boyle, Drew, Holt, Longmore, Ludlow-Hewitt, MacEwen, Newall, Warrington-Morris, Fellowes, The Rev. R. E. Vernon Hanson.

Colonels T. E. St. C. Daniell, Sir Walter Lawrence, Bt.

Captain Birkett, R.N.

Group Captains Barratt, Bettington, Busteed, Bigsworth, Christie, Courtney, McNeece-Foster, Gossage, Gill, Rathborne, Ross, Smyth-Piggott, Cave-Browne-Cave, Grenfell.

Lt.-Colonels Donaldson-Hudson, Fell, Sir Francis McClean, Rabagliati, Dore.

Wing Commanders J. T. Babington, Hetherington, the Hon. Maurice Baring, Bailey, Barton, Colbran, Cordingley, Don, Douglas, Evill, Garrod, Gould, Graham, Grant-Dalton, Laws, Macdonald, Maude, Maund, Maycock, Murlis-Green, Murray, Nicholl, Parry, Peck, Robinson, Ryan, J. Sowrey, Sutton, Tyssen, Ward, Welsh, Hicks, Tedder, F. Sowrey, Collishaw.

Majors Beatson, Bulman, Iliske, Lambert, Moller, Pye-Smith, Reynolds, Somers-Clarke, Windeler.

Squadron Leaders J. O. Andrews, Baker, Beauman, Black, Budgeon, Burge, Capel, Cockey, Cole-Hamilton, Coningham, de Roeper, Don, Ellerton, R. Graham, Elmhirst, England, Evans, Everidge, Gilley, the Rt. Hon. F. E. Guest, Hall, Hamilton, Hollinghurst, Jones-Williams, Lees, Leslie, McEntegart, Maynard, Rea, Ridley, Russell, Slessor, Thomas, Wann, Workman, Williams, Glenny, Orlebar, Scott.

Captains Bailey, Dainty, Furniss, Herbert, Hogarth, Moore, Ramsay, Waddington, Woodford, Findlay, Plugge.

Flight Lieutenants Andrews, Allen, Cahill, Chick, Dearlove, G. E. Gibbs, V. R. Gibbs, Gillman, Halford, Hilton, Martin, Sorley, Whitaker, Durrant, Jenkins, Openshaw, Wiggin, Wilson, Eales-White, May, Pope, Mellor, The Rev. C. S. Ensell, The Rev. C. F. Neate.

Messrs. Atcherley, Broadway, Colebrook, Crosbee, E. B. Fielden, N. Fielden, Gowing, Howes, Hurst, Jones, Newsome, Pumphrey, Purdey, Snowden-Gamble, Stubbs, Walker, Winter, Barfoot-Saunt, Grey, Trusk, Yeatman, Presland, Switzer, Ward

Proposing the toast of the Royal Air Force Sir Hugh Trenchard thanked Air Vice-Marshal Longcroft for his seven-year chairmanship of the Club, and Group Capt. Gossage, Major Pye-Smith, and Sq. Ldr. Andrews for their work as organisers.

Turning to the R.A.F. Sir Hugh Trenchard said that the proposed expansion was not yet complete. There were still twenty or more squadrons to be raised. But when we looked back ten years we could not think we were not progressing. While the Air Force was expanding it meant harder work for those in the force than if it were stationary. And those who had left could help by making people understand that the Air Force existed for work and not for pleasure.

Those who were building the Air Force had built the foundations and the walls and the roof. The furniture still had to be put in. So they must create stability and not ask for changes,—some years must still pass before the idea of a separate Third Service had sunk into the thoughts of the British people.

Sir Hugh reminded his hearers of what the R.A.F. had done of late, referring particularly to the Far East cruise of the Supermarine flying-boats under Grp. Capt. Cave-Brown-Cave; Sir Philip Sassoon's visit to the over-seas units; Sir Samuel Hoare's journey of 4,075 miles in five days from Cairo to the Soudan and back; and the Kabul evacuations of 586 people in 80 flights covering 28,000 miles without loss of life in the worst weather.

Referring to the widespread activities of the R.A.F. Sir Hugh mentioned one squadron at Hinaidi which on a certain day had two machines at Risalpur, two at Aleppo, two at Karachi, and two at Hinaidi. He mentioned the flight to India non-stop of Sq. Ldr. Jones-Williams and Flt. Lt. Jenkins. Also he told of Sq. Ldr. Livock's various journeys from and to Karachi along the Persian Gulf in the heavy rain season to test the possibilities of flying-boats, and of Sq. Ldr. Howe's journeys from Basra, up and down the Persian Gulf.

Sir Hugh said that the R.A.F.'s work at Aden was one of the most brilliant things it had done. And he referred particularly to the high value and the personal enterprise of Sir John Salmond's flight all round Australia.

Looking to the future he drew the attention of his hearers to the Air Force List, in which they might see "the flow of promotion starting up, *and out.*"—[The reference here is no doubt to those officers who will retire after promotion,—those known in the R.A.F. as "the beach party."—C. G. G.

He referred gracefully to the laying of the foundation stone of the R.A.F. College at Cranwell by the Lady Maud Hoare, and to the habit of His Royal Highness the Prince of Wales of flying everywhere with the minimum of fuss as happy omens for the future.

Finally he gave a list of the events in athletics and other forms of sport in which the R.A.F. had been victorious over the other Services,—or over notable civilian organisations such as the beating of Sandhurst and Woolwich in Rugby Football by the R.A.F. College, and the beating of the Navy by the R.A.F. in Association Football, and the beating of the Army in Egypt in the same game, and the beating of the Navy in Polo, and the winning of the Marathon Race again by Corporal Ferris.

After the toast of the R.A.F. had been honoured, Sir Hugh Trenchard proposed the health of Sir Samuel Hoare saying that his work was known throughout the World. He had got over difficulties which seemed impossible to overcome in organising our Imperial air routes. And on the Service side he had always stood up for the R.A.F.

SIR SAMUEL HOARE replied, after his health had been drunk in a way which showed clearly how much his high qualities are appreciated by the Air Force.

He said that there was no assembly where he would rather have his health drunk than by this one, and there was no man by whom he would rather have it proposed than by his old friend Sir Hugh Trenchard. One of the most tiring some jobs which Sir Hugh had had must have been the education of successive Secretaries of State. His own predecessors, including Capt. F. E. Guest were not difficult, but he sympathised with Sir Hugh when he himself came into office in 1922, the third to be instructed in a few months. He had only been in the air once before that date, and that was on the Italian Front during the War, in an Italian airship, with the then Lord Mayor of London, who was

completely beatific all the while, having taken three boxes of Mothersil's on the way from the hotel to the air station.

Mr. Bonar Law had said, only a few months earlier, that the Air Ministry would soon be abolished and that the Army and Navy would split up the Air Force between them.

His own interest in Empire Air Routes began, he said, when Sir Hugh Trenchard showed him a big map with, marked on it, the landing grounds which would link up the Empire.

Recalling one of his recent journeys to the East by air, when, owing to a delay he had to finish his journey by rail,—he told the story of the French officer who, meeting him in Paris, said that if only he (Sir Samuel) had been killed in a railway accident—for preference on an Italian railway—on his way home he would indeed have established the superiority of Air Transport.

He disclaimed any credit for his work and said that no captain could fail with such a team to back him as those pioneers of Air Control, Air Defence, and Technical Development, whom he saw around him that evening.

In conclusion he said that he had worked with Sir Hugh Trenchard for six years, and they had been in many difficult corners. No Chief of Staff and Political Chief had ever been in closer touch. He himself could not wish for a better friend or a surer rock of support. Sir Hugh Trenchard had doggedly held a very difficult position, and there would be no more distinguished page in History than that which would tell of his work. He (Sir Samuel Hoare) appreciated the honour which the R.A.F. paid to himself more than almost any that had come to him.

HIS ROYAL HIGHNESS THE PRINCE OF WALES then proposed the health of Sir Hugh Trenchard, saying that he had thought he was going to have a night off from speechmaking. As a Group Captain, R.A.F., he was glad to thank the Dinner Club for their hospitality, and said that he found his transport much facilitated by the R.A.F.

His Royal Highness said that his reason for rising was to propose the health of Sir Hugh Trenchard, as this would be his last dinner with the Club as Chief of the Air Staff. He could claim Sir Hugh as an old friend, not only in the Royal Air Force, but as the highly efficient Colonel of the Royal Scots Fusiliers. Sir Hugh often came to see him, perhaps about his having to wear a very uncomfortable parachute, or about the prospects of young officers, or about the costumes of the fighting men of his Fusiliers.

Sir Hugh Trenchard, the Prince said, might justly be described as the Father of the Air Force. He did not exactly begin the Air Force, but he was a pioneer of Service Flying, and as Chief of the Air Staff he had watched the triumph of the Air Force materialise. The Royal Air Force had never known peace conditions, and much was due to Sir Hugh for the fact that the Air Force had been so soon able to get on an efficient and stable footing. The Royal Air Force was very lucky to have a man of so many fine qualities to guide them. Sir Hugh Trenchard, he said, was a fine soldier, a fine sportsman, and a great gentleman, who would never let you down. He would be leaving this year. The greatest compliment which we could pay him would be to say how much we should miss him.

The feelings of the Air Force having been almost adequately shown, Sir Hugh Trenchard gently thanked the Prince of Wales for the honour done to him, and thanked the Air Force for making his task easy.

Thereafter the company went to another room where they talked. The Prince of Wales remained till long after dinner was over. And many of the younger generation of officers realised the value of this annual gathering.—C. G. G.

THE GOVERNMENT AND AIR SURVEY.

The Rt. Hon. J. H. Thomas, M.P., Lord Privy Seal, speaking in the House of Commons in the Debate on the Address from the Throne of July 3, said:—

With regard to the development of cotton in our Colonies I am one of those who want to make this country independent. I did much in 1924 to encourage that. I now find that surveying in the ordinary course will take four or five years. Is it worth waiting five years for the surveys? I also find that with modern aeroplanes, which are now at our disposal, these surveys can be done in four months. We shall have them carried out by aeroplanes right away wherever necessary, to save delay in valuable developments. All this is an indication of how much can be done within the Empire itself.

Major H. Hemming, Managing Director of the Aircraft Operating Company Ltd., in a letter to *The Times* of July 5 states:—

Sir,—It is indeed encouraging to learn from Mr. Thomas's speech before the House yeterday that the Government are going to have surveys carried out by aeroplanes right away in connection with Empire development.

It is becoming generally recognised that, before opening up undeveloped territories, an economic survey should be made. The recommendations made in the Report of the Commission on the closer Union of the Dependencies in Eastern and Central Africa, of which Sir E. Hilton Young was chairman, recognise this. The high state of efficiency which has now been reached by British companies in carrying out air survey work can enable the recommendations of the Commission to be carried very much further, and also provides a means of giving effect to these recommendations both economically and rapidly.

In the practical field of air survey, British interests lead the world to-day. The air survey work which was undertaken for the Government of Northern Rhodesia has been recognised by that Government as a complete success. We have now reached the stage where we can claim that air surveying, if properly utilised, can be of inestimable value to Empire development. It is most encouraging to know that the Government recognise this. In order to give some idea as to what air survey, in association with suitable ground organisation can do, I would point out that it would be possible to carry out an economic survey of Northern Rhodesia, which has an area of approximately 300,000 square miles, for less than £450,000—that is at a rate slightly below 30s. a square mile. This figure covers all costs, including the flying and taking of the photographs, the laying down of the ground control, the preparation not only of the topographical maps but also of the geological and vegetational maps, and the sending out of the experts dealing with vegetation, soils, minerals, etc., and the information gained would also enable the authorities to decide on the best lines for new roads or railways to take. This survey can be completed in four years.

I am, Sir, your obedient servant,
H. HEMMING.

RED CROSS AEROPLANES.

The International Red Cross Diplomatic Conference, on July 12, adopted a new article of the Geneva Convention dealing with the use of aeroplanes for Red Cross work during war.

The final text was as follows:—

(1) Aeroplanes used for medical purposes should enjoy the protection of the Convention on condition that they be exclusively reserved for the transport of sick and wounded.

(2) The aeroplanes must be painted white, and clearly marked with the distinctive sign provided for in article 18 (a red cross) in addition to the national colours on their lower and upper surfaces.

(3) Except in case of special and express permission it is formally forbidden to fly over the line of fire, as well as over the zone situated in front of the chief medical clearing station, or over any fortification whatever.

(4) Medical aeroplanes must obey every summons to land.

(5) In case of unintentional or forced landing on enemy territory the sick and wounded, as well as the personnel and material, including the aeroplane, continue to benefit by the present Convention.

(6) The pilot, mechanics, and wireless operators captured will be surrendered on condition that they give their parole not to serve until the end of hostilities in any but a medical formation.

THE BIGGEST YET.

A SPLENDID EXPERIMENT.—The Dornier Do.*x*, afloat on Lake Leman, with her twelve Siemens-Jupiter engines set in six tandem housings.

The following details are to hand, from the Berlin correspondent of *The Times*, about the Dornier Flying-Ship Do.*x*, with twelve Siemens-built Jupiter engines. The description is interesting as showing how ship-like the design is, more especially in making the pilot responsible only for the control surfaces. There is a little difficulty in imagining how such a system can assure the necessary correlation between flying and engine controls:—

The 12 525 h.p. Siemens-Jupiter engines are mounted in pairs, with one pusher and one tractor airscrew in each pair, on a small auxiliary plane above the main plane. This gives the flying-ship from some angles almost the appearance of a biplane. A shaft leads from each pair of engines down to the main plane, which has a span of 160 ft., and along which runs a narrow gangway 2½ ft. high. On this are rails and a small trolley on which mechanics, lying flat, can propel themselves until they reach the engine-pair they want to inspect. In this way it is possible to reach any of the engines during flight and to carry out repairs. It is believed that the machine would be able to maintain itself in the air without loss of height even if four engines failed.

The uppermost of the three decks, a projecting windowed structure with a wide field of view, is the "command station," or "bridge." Forward is the steering cabin, for two pilots, behind that the navigation room for the ship's officers, containing all essential instruments and maps, and behind that again the engine control station, where the engineer officer watches the performances of the 12 engines. There is also a small wireless cabin and mail-room. The crew will consist of the captain, second officer, two pilots, an engineer officer, four mechanics, a telegraphist, a cook, and a steward. The pilots will in a sense be simply helmsmen; they will have no concern with navigation or engines. As on board a ship, their task will be to hold to the course set by the captain.

From the "bridge" a gangway leads down into the ship's interior and the main deck, containing the passenger accommodation. Here are the cabins, each for four or six passengers, divided by a central gangway which runs the length of the ship. Amidships are the large dining and sitting rooms; forward a luggage hold, and aft the kitchen and lavatories. Beneath this middle deck are the fuel and oil compartments connected with the engines by feed-pipes. With the necessary supplies of oil and fuel and the crew of 12 the craft will weigh about 35 tons; its useful load for a flight of 1,000 kilometres (about 620 miles) is calculated at 15 tons, and it is estimated that for that distance it could carry more than 100 passengers with their luggage and a fuel reserve of 50 per cent. The ship also has an auxiliary 4 h.p. engine which serves the lighting plant, the wireless generator, the cooling-water pump, the compressor for starting the engines, and the leakage-pump. The ship's draught when loaded is estimated at 1¼ metres (about 4 ft.), and the propellers would stand 7¼ metres (about 23 ft.) above the surface of the water.

Three short test flights were made first of all, the flying-boat taking off in approximately 30 secs. each time and flying a straight of a few hundred yards.

The latest report to hand states that the Do.*x* has now carried out long flights up to 3 hours' durations.

She was taken out with 25 persons on board and having an all-up weight of 36½ tons, took off with only 8 engines running in 28 secs. She climbed well and made an entirely successful flight at considerable altitude.

Those who like accuracy in the nomenclature of aircraft should note that the "Do." part of the name is the standard abbreviation for the name of Mr. Dornier, the brilliant designer of the machine, and the *x* is the mathematical unknown quantity. Thus the name Do.*x* implies that Mr. Dornier modestly regards the machine as an experiment. All will wish success to his enterprise.

An excellent model is shown on the German stand at Olympia.

THE BIGGEST YET.—The mounting of the Siemens-Jupiters on the Dornier Do.*x*.

SEAWORTHINESS TEST OF "ROHRBACH-ROMAR."

SEAWORTHINESS !

Seaworthiness will always be one of the most difficult conditions to be met by flying-boat constructors.

For quite a couple of years the Aircraft Industry has been unable to guarantee their Customers any reasonable figures of seaworthiness for flying-boats.

The Rohrbach Metall-Flugzeugbau G.m.b.H. was the first firm, ever since the construction of flying-boats was started by the industry all over the world, to guarantee, for the three "Rohrbach-Romar" ships then under construction seaworthiness in a sea up to force 5 (Beaufort).

On December 12th and 13th, 1928, the "Rohrbach-Romar" underwent her seaworthiness trials, under supervision and to the entire satisfaction of the "Deutsche Versuchsanstalt für Luftfahrt and Deutsche Lufthansa A.G.," who satisfied themselves of the excellent manœuvrability of the ship in rough waves.

A model of the "Rohrbach-Romar," 5 metres in size, will be shown at the "International Aero Exhibition," Olympia, at London, from July 16th to August 1st, 1929, so that all details can be easily inspected and studied.

ZEISS

BEACON LIGHTS for AIR ROUTES

are fitted with silvered glass reflectors of special form, which distribute the light so that the greatest intensity is in the horizontal direction, thus enabling pilots to see the lamp while still a great distance away. The lamp is about 18 in. diameter, and uses a 500-watt bulb giving a horizontal intensity of about 3,000 c.p. The light may be white or coloured as desired. A larger model, 24 in. diameter, can be supplied, and its efficiency is correspondingly higher.

FIRTH AERO STEELS

AT STAND No. C78

British Steels and British Craftsmanship are to-day winning laurels everywhere. Firth Special Alloy Steels have been extensively used in almost every British world record-breaking achievement on land, water, and in the air. These steels were used in many of the vital engine parts of the Schneider Trophy Winner—the "Supermarine-Napier S.5"; the R.A.F. Fairey Monoplane which made the first non-stop flight to India, and the four R.A.F. Supermarine Flying Boats wh ch flew from England to Australia and back to Singapore last year. The components made from Firth Special Alloy Steels were supplied either in the form of drop stampings by our associated company, the Firth-Derihon Stampings Ltd., of Carbrook, Sheffield, or direct from the bar.

The whole resources of our technical and research departments are at your disposal for the solution of any problems connected with aircraft steels, and we cordially invite discussion.

Visit our Stand No. C78 at the International Aero Exhibition, Olympia, London, July 16th—27th.

A FLYING-SHIP.—A schematic drawing of the interior of the Do *x*.

THE "ONCE-UPON-A-TIME" PILOTS.

BY RODNEY HOLT.

Scattered over this country of ours are large numbers of young men who, to their boundless delight, were known a dozen years ago—thanks to some inspired journalist—as "intrepid birdmen." Many of them are "birdmen" yet and, one supposes, no less "intrepid," but the men I have in mind are those who, like myself (and, maybe, you also), crawled from their last cockpit at the end of the War and faded away into civilian life.

We went vowing gaily, "Oh, we shall keep in touch with flying." And tried hard to do so. Flying journals, Air Pageants and the like did their best for us. Our deep interest in aviation defied the passing years. But that subtle intimacy which belongs only to those who fly day by day gradually, imperceptibly slipped away from us.

However, we are perfectly happy among ourselves, we "once-upon-a-time" pilots. Put two of us together for a few minutes and the conversation, even now, inevitably drifts to the one absorbing topic.

"Do you remember," my companion will murmur reminiscently, "those right-hand turns on the 'Camel'?"

"I do," is my reply, for what "Camel" pilot could forget them? "And its trick of spinning from the top of a loop," I add. "Now, the Pup on a climbing turn . . . ." and so on, with undiminished enthusiasm, hour after hour.

This is all very pleasant. In the privacy of our own homes we can still talk about flying with an air of unchallengeable authority. Our wives gaze at us proudly as technical phrases, incomprehensible to lesser mortals, roll glibly from our tongues.

Really, to hear us discussing the finer points of piloting, one might imagine that we had just landed, parked our machines in the garden, and came indoors for a friendly yarn. Nobody could guess, for example, that ten years had passed since either of us handled an aeroplane's "joy-stick"—except a present day pilot. And he would know in a minute!

He would notice, I expect, that whilst discoursing learnedly on antiquated dead-and-buried machines we were not nearly so fluent about the newest aircraft. He would perceive a strange reluctance, on our parts, to comment on the vagaries of, say the Siskin in a loop or roll. So many tiny details would betray us. The cold truth would dawn upon him . . . . and what then?

If he were an old war-pilot himself he would readily understand how vivid the memory of flying remained in us. He would sympathise with, and enter into, our glowing talk of the aircraft of the past. But a young newly-fledged pilot, to whom these ancient machines were no more than mere names, would find difficulty in repressing a feeling of mild amusement at two "once-upon-a-time" pilots with their quaint out-of-date notions.

And can we blame him? After all, to take a parallel case, would *we*, as proud possessors of the 1929 Super-Sports motor-cars be wildly impressed by an argument, however brilliant, over the respective merits of 1904 De Dions and Panhards?

No, a back seat (if, indeed, we are allowed a seat at all) is clearly indicated for us poor onlookers. What we knew and did, once-upon-a-time, counts for very little now. For in the flying game there is no half-way house—you are either "in" or "out."

All the same, we feel that we were "in" the game at the right time. Ours was the earlier stage of aviation:—when people would look into the sky and say, "See, an aeroplane!" instead of, as now, grumbling, 'Confound the noise!"; when one indifferently performed loop on a B.E.2c would provide a village with a week's excited gossip and speculation as to the wonderful pilot's identity; when we learned to fly straight and dreaded to turn right or left so obsessed were we by the prevalent belief that a flat spin was a thing from which no man could extricate himself; when that one silent prayer from immunity from fire was ever present in our hearts . . . . —and when we counted amongst our friends those legendary heroes of the air—Lanoe Hawker, Ball, McCudden, Mannock, and the rest, the men whom we followed blindly into the Valley of the Shadow and back, the men whose unflinching devotion to their duty steadily inspired us to do ours. . . .

"Once-upon-a-time" pilots, perhaps. But the *spirit* of flying is our heritage for all time.

PROLONGING THE JOKE.

Reuter was responsible for this on July 13:—

After a flight that has continued uninterruptedly for 10 days 6 hours 44 minutes, and has surpassed the previous endurance record by over three days, the aeroplane *Angeleno* landed yesterday at Culver City, California.

This well-worn stunt may be humorous, but why accentuate it by making an angel of the shade of Dan Leno?

THE BIGGEST YET.—The great Dornier Do.*x*, with twelve Siemens-built Jupiter engines (6,300 h.p.) in her shed at Friedrichshafen.

CIVIL AVIATION IN AMERICA.

The American Chamber of Commerce in London held their monthly lunch at the Cecil Hotel on July 11 and invited a large and representative gathering to hear Mr. George J. Mead speak on Civil Aviation in America.

Among the guests were Air Vice-Marshal Sir Sefton Brancker, Mr. Lester D. Gardner of New York, Capt. P. D. Acland (Chairman of the S.B.A.C.), Col. The Master of Sempill (Chairman of the R.Ae.S.), Sir Vyell Vyvyan (of Imperial Airways), Mr. C. L. Egtvedt (of the Boeing Airplane Co.), Mr. F. Handley Page, Sq. Ldr. the Hon. F. E. Guest (of National Flying Services), Mr. S. Bloom (Congressman).

That the first important function of the London Show Period should be organised in London by Americans for English guests is typical of our muddled way of doing things.

Mr. F. E. Powell, the Chairman of the Chamber, introduced Mr. Mead as the Vice-President and Chief Engineer of the Pratt and Whitney Aircraft Co. and of the United Aircraft and Transport Corporation.

Mr. Mead said that the great difference between Aviation in America and in England was that over there it had to pay by itself and could not rely on subsidies to help it along. They were probably better situated to concentrate on the Commercial side of aviation as there were not many people who would be likely to give their military organisations any trouble to deal with.

He spoke with modesty on the efforts America had made in developing Civil Aviation but mentioned that though they, up to the present, concentrated on postal work they were going ahead with passenger-carrying and felt a certain amount of pride in the fact that they had carried over 40,000 passengers in the last six months, and that one company had taken some 2,700 to some mines in Canada where there was no rail transport.

He stressed the fact that they had had to turn almost entirely to postal work as that was the thing that could and had been made to pay, and that passenger work was a far more problematical source of income. From 1920 to 1924 the mail services had been run by day only and then from this year they started night services as well and this year the passenger-carrying traffic has been developed. Having gained the experience necessary for reliable operation during the previous years they now felt that they could guarantee sufficient reliability to attract passenger traffic, and one firm alone had run over 8,000 miles in the last two months with 100% efficiency.

Air-cooled engines had very largely brought about the rapid expansion of the various lines, ever since they had been taken over from the State and operated by private firms, because the air-cooled engine was inherently more reliable than the water-cooled engine, and the saving of weight of the former over the latter provided a large increase in pay load. He pointed out that 70% of the forced landings due to engine trouble had been caused by trouble with the cooling systems.

The latest step in passenger flying was the combination with the trans-Continental railways, whereby passengers could fly by day and travel on the train by night thus saving nearly half the time of the normal journey.

The mail service was now highly developed, and with the help of the lighted routes, where night-flying was being regularly carried out over the mountains, they were flying over 70,000 miles daily and had carried over 600,000 lbs of mail in the last 6 months.

Developments were going ahead with the radio-telephone and they hoped by this means to overcome the trouble of flying with safety through foggy areas, as the pilots could be directed to safe landing-grounds.

Germany, he said, was now following the lead of America and lighting their routes and concentrating on mail-carrying instead of making passengers the chief part of the work.

He paid tribute to the work done with passenger-carrying here in England and said that we were second to none for this class of work, and that America was much i

THE ENDURANCE RECORD.—The artist who is responsible for this picture writes: "You have been reproached by the 'Aero Digest' for a certain lack of modernity in your publication. The introduction of the humorous element occasionally may tend to raise the standard of 'The Aeroplane' to the level of the more progressive American journals. In fact, one might seriously suggest the institution of a comic strip as a regular feature which, as Aviation develops, might grow into an 8-page comic supplement, in accordance with up-to-date ideas!!"

debted to us for the help we had so readily given when they started carrying passengers.

The industry in the United States as a whole was, he said, very healthy, but there was a grave danger of there being too much capital put into it; for all good progress was necessarily slow and the public would expect dividends sooner than it was economical to start paying them. There were some 2,000 firms directly connected with the industry and of these about four were well known engine building firms and about 20 really solid aircraft building firms.

The general trend was towards standardisation, and recently a very great deal had been done towards this end. Their chief trouble was a lack of really good pilots who were fit to take charge of valuable machines with valuable cargoes. But the schools were being co-ordinated and in time this difficulty would be met. Their mail pilots were the finest in the world and he thought that they had not received enough praise for the magnificent work they did.

As for the future, transportation must and always would be the prime interest in aviation. Private ownership would be second. But for economical working of transportation lines they must have good aerodromes and reliable weather reports.

Aerodromes were being made all over the Continent. And the Government was doing very great work with the problem of weather reports, and the day was not far distant when pilots would be able to obtain weather reports of any district from any aerodrome where they landed.

The large mergers, of which there had been so much talk lately, were bound to tend towards stabilisation and were a very good sign indeed, as even now there were more individual firms in the industry than there were in the motor-car trade.

Their chief trouble was to secure personnel with sufficient experience. But they were growing slowly and it was only by slow growth that real soundness could be reached.

Much was being done to make the private machine easier to fly, but he did not expect that private owners would increase in such numbers that they would have "Fords of the Air" yet. And aircraft had always to be of the highest quality to be safe. There were three things which everyone agreed had to be of the best,—your wife, your toothbrush, and your aeroplane! [That is a typically American remark. An Englishman would probably have linked "bed and beer," or if he had thought of a wife as important he might have said "wife and whiskey," for the sake of alliteration. But a toothbrush is not a thing which looms large in the Englishman's cosmos. The American view is one of those minor spot-lights on American success in the World which explain so much.—C. G. G.]

Transportation by air, Mr. Mead said, was no longer an experiment. He thought that the more international air lines were developed so much the more would international misunderstandings become things of the past. Rapid transport between countries would lead to a better understanding of each others' problems.

Sir Sefton Brancker, replying, said that on all points we had done exactly the opposite to the States. With restrictions we had always been meticulous—they had been free. We had subsidised,—they had not. They had concentrated on mails,—we on passengers. They had tended toward competitive working,—we toward a monopoly. Both systems were right in their ways, but now he felt that theirs had proved the best.

We had given America a large amount of experience with air-cooled engines, and now we were getting it back.

He stressed the wonderful development that America had made in the last two years, as they were now flying greater distances on regular routes than all Europe together.

But we were also making strides with Empire Development, and he thought that the development of air transport was going to do more towards stopping wars than anything else, it would do so by developing civilisation and international co-operation. [On this point of Empire Development readers are referred to Sir Samuel Hoare's speech at the R.A.F. Dinner, which appears in the Royal Air Force pages of this paper.—C. G. G.]

HOW LONG, OH LORD, HOW LONG?

The Bellanca monoplane Pathfinder, which was piloted by two American aviators, Messrs. Roger Williams and Lewis Yancey, left Old Orchard (Maine), U.S.A., on July 8 in an attempt to fly to Rome, and reached Santander in Spain after a flight of 31 hours. The Pathfinder actually landed at a place called Albericia, which is outside Santander.

The landing is said to have been due to lack of petrol and the aviators state that they only used 315 gallons for the flight. One must therefore conclude that the report that the machine had taken off with 500 gallons was inaccurate. Could the Pathfinder have reached Rome with only 315 gallons?

The French flight to Paris from Old Orchard also reached Santander and took two further hops to Paris.

One no longer flies the Atlantic, one flies from somewhere in the States to a capital of Europe.—Of course, one does not always get there.

MORE TRANS-ATLANTIC FAILURES.

Although officially prohibited by the French Government two more machines went up from Le Bourget Aerodrome in a simultaneous attempt to fly the Atlantic on July 13.

The Polish machine, *Marshal Piludski*, flown by Majors Idzikowski and Kubala, is reported to have crashed on landing on the island of Graciosa, in the Azores. Major Idzikowski is reported killed.

The French machine, the *Question Mark* (no relation to the re-fuelling stunter), flown by Capt. Costes and M. Bellonte, was forced to turn back, owing to head winds when near the Azores and landed at Villacoublay on Sunday morning, July 14.

M. le Brix, the partner of Capt. Costes in his great World flight last year, was in England on Monday and Tuesday last. There seems to be some mystery about the latest attempt by Capt. Costes.

The Sikorsky amphibian named *'Untin' Bowler*, which was attempting a flight from Chicago to Berlin by way of Northern Canada and Greenland, has been lost near Port Burwell, Ungava Bay, but its crew are safe.

The aeroplane drifted out to sea among the icefloes from its moorings yesterday evening, according to a wireless message received to-day by the Department of Marine.

[This last is a great pity, for the flight was a sound attempt by a good sportsman to find a reasonably safe way of flying to Europe by a short route. Better luck next time.—C. G. G.]

THE STOCKHOLM—NEW YORK FLIGHT.

Captain Ahrenberg's seaplane, the Sverige, was on July 13 still detained at Ivigtut, Greenland, by a leaking float.

THE LAIR OF THE GREAT CATS.—The test-house of the Armstrong Siddeley engines at Coventry, where the Leopard, the Jaguar and the Lynx were under test at night. (An interesting flashlight effect.)

AIR PHOTOGRAPH AND LINE MAP.—One of the photographic map sheets of desert country and an irrigated village near the Tigris as supplied to the 'Iraq Survey Dept., and a line map prepared from the photographs to the same scale by the Aircraft Operating Co. Ltd.

SOMETHING ABOUT SURVEY.

[*Aerial survey in relation to the economic development of new countries, with special reference to an investigation carried out in Northern Rhodesia.*—R. Bourne, M.A., Imperial Forestry Institute, Oxford, formerly of the Indian Forestry Service. 35 pp. 2 half-tone and 1 coloured plates. 3s. 6d. net. Oxford at The Clarendon Press and THE AEROPLANE Book Dept.]

To those who, like the present reviewer, have been "jungle-wallahs," the Indian Forestry Service spells cheerful efficiency, and this reputation can but be enhanced by this able monograph prepared by one of its officers. Mr. Bourne's especial duty while at Oxford has been "to watch all development in aerial survey, more particularly in their relation to the reconnaissance of forests."

For some years past forest authorities and companies in the United States, Canada and Burmah, have tried different methods of aerial survey as a means of furnishing, or at lea supplementing, the information obtainable by the forest official afoot. Although the conditions in these three countri differ widely (the reviewer has, on occasion, taken two hou to advance a hundred yards in some of the "wet" fore in Burmah, conditions which did not hold in the States) t results obtained during these surveys have been of such val and promise as to justify more research on the subject, p ticularly because, as Mr. Bourne so aptly says, "the futu prosperity of the British Empire depends a good deal up the economic development of the agricultural, forest, a mineral resources of the Colonies, India, and the Dominions

There is importance in remembering that although t incidence of mineralogical deposits was determined in ge logical times, that of vegetation is subject to the varied i fluences of climate, geology, soil, disease, and the activiti of man. Where man is absent and nature has a free re then the ultimate result is nearly always forest.

AN INTERESTING COMPARISON.—Two types of aerial photographs. On the left an oblique and on the right a vertical, the extra detail of the oblique supplementing the accurate map-like character of the vertical. They were taken during the 'Iraq survey and show the village of Khadimain on the River Tigris.

If this condition should obtain, then the state and form of the forest depends mainly on the climate. Locally, however, within any climatic zone, the natural forest tends to vary with changes in geological formation and the condition of the soil. The soil itself exerts an immense influence on the natural forest, being itself affected by the climate.

The general result of all these conditions serves to draw attention to the fact that "vegetational and soil surveys are a means not only of taking stock of the resources of a country, but also of studying the history and present condition of a locality with special reference to its climate, vegetation, soils, and in many cases geology. *Indeed local study of the correlation existing between vegetation, climate, topography, and soil should form the scientific basis of all agricultural and forest practice.* That such surveys may also throw much light on the geological formation and, in consequence, upon possible mineralisation is a point to be borne in mind."

This is very important, for it suggests that, given enough experience and careful research, aerial surveys may become almost an exact method of discovering the precise location of mineral deposits, which could only be discovered otherwise by laborious and perilous prospecting.

Mr. Bourne had the opportunity recently of demonstrating the truth of this dictum, for he conducted a vegetational and soil survey for the Government of Northern Rhodesia, part of which was made along the Solwesi-N'Changa road. When he had finished his survey he visited The Aircraft Operating Company's air survey expedition (under the command of Major C. K. Cochran-Patrick, D.S.O., M.C.) at N'Changa.

He found that the photographers of this expedition had taken a strip of over-lapping photographs of some 140 miles of the road, at a height of approximately 10,000 feet above the ground. The Rhodesian Congo Border Concession Ltd. (for whom The Aircraft Operating Co. Ltd. was making the aerial survey) courteously gave permission for the strip of photographs to be placed at Mr. Bourne's disposal.

The latter had made his ground survey from a motor-car, travelling at an average speed of 15 miles an hour along the road. This method had the disadvantage that he was able to see only the fringe of the vegetation on the side of the road—but with the aid of the aerial photographs Mr. Bourne was able to mark down the different vegetational types, to study the shapes of the grassy glades, the native cultivation, and generally *to consider the vegetation in relation to the geology of the country.*

He later prepared a coloured map of his survey which is reproduced (in the customary beautiful manner of The Clarendon Press) in the monograph which gives all this information.

The result of his labours was to convince Mr. Bourne more than ever that, although the conditions in Northern Rhodesia are helpful to the aerial surveyor, the extension of such surveys "might prove to be one of the most profitable investments that the Empire could make in the immediate future."—S. G.

HAWAIIAN AVIATION.

Hawaii and its attendant islands are known in England as a sort of earthly Paradise, whose first publicity agent was the poet Rupert Brooke. The recent mass-production of ukeleles, and of songs referring to that part of the World, have perhaps taken some gilt off the gingerbread.

The notorious Dole Flight across the Pacific, when so many competitors were lost in the attempt to fly non-stop from San Francisco to the Islands drew a lot more attention to Hawaii and the rest of the group. And now the news comes through that they really are on the map, and in the humdrum of commercial existence.

Two rival concerns have been floated to organise air-lines and link the Islands together. And they are placing orders for equipment and generally preparing to get matters moving.

Hawaiian Airways, as one concern is known, has placed orders for two Fokker F-10 trimotor monoplanes (three Pratt and Whitney Wasps) and an Eaglerock biplane for use in Hawaii.

Inter-Island Airways Ltd., the company proposed by the Inter-Island Steam Navigation Company, has filed articles of incorporation and has ordered three eight-seat Sikorsky amphibians.

HULL'S AERODROME.

Negotiations have been completed between the Hull Corporation and the War Office for the leasing of land for the establishment of a seaplane base on the River Humber.

The offer of National Flying Services Ltd. of a rental of £350 per annum for a portion of the municipal aerodrome site at Hedon was accepted on July 14 by the Aeroplane Committee of the Corporation.

A JAPANESE AIR TRANSPORT COMPANY.

For some considerable time authentic information concerning the development of Civil Aviation in Japan has been desirable. On July 11 *The Army, Navy and Air Force Gazette* published, by permission of the General Staff, War Office, an article which, coming from such a source, is worthy of particular consideration. It is therefore reproduced hereafter:—

The development of civil air routes in Japan has recently been placed upon a secure business footing by the formation of the "Air Transportation Company, Limited" (Nippon Koku Yuso Kabushiki Kaisha). The capital of the company is approximately £1,000,000, and it is the first firm of its kind to be launched in Japan. Its establishment is the result of the passage of a Bill through the Imperial Diet agreeing to provide a subsidy amounting to approximately £2,000,000, spread over 11 years. When the company re cently offered its shares for public subscription they were over-subscribed by 140 times the original amount.

The proposed routes which it is hoped to inaugurate thi year include Tokyo—Dairen and Osaka—Shanghai. The dis tances, estimated hours of flight, etc., of these routes ar shown in the following table:—

Between	Distance in kilometres.	Hours of flight.	Number of trips per wee 1st year of operation.	2nd year of operatio
Tokyo—Dairen route.				
Tokyo—Osaka ..	425	2·50	12	12
Osaka—Fukuoka ..	500	3·20	6	6
Fukuoka—Seoul ...	550	3·40	3	6
Seoul—Dairen ..	600	4·00	3	6
Total	2,075 (1,290 miles)	13·10	...	...
Osaka—Shanghai Route.				
Osaka—Fukuoka ...	500	3·20	3	6
Fukuoka—Shanghai	950	6·20	...	...
Total	1,450 (900 miles)	9·40	...	...

At the beginning of April, 1929, the first practical st towards the establishment of the Tokyo—Dairen route w inaugurated by an air service between Urusan (50 mil north-east of Fusan in South Korea) and Dairen. At prese the service is being run three times a week in each directic mails only being carried. The route is Urusan—Seoul Heijo—Dairen, the total distance of about 600 miles bei scheduled to occupy 6½—7 hours in the air, with one adc tional hour at intermediate halts. During the present e perimental stage, Salmson machines taken over from tl military authorities are being used, necessitating one chan of machine at Seoul.

It is hoped that larger and more modern Fokker machin ordered from Holland will arrive in time to carry on t service in July and August, but until then the sea passa of about 160 miles between Urusan and Fukuoka (at t western end of the island of Kyushu) will not be attempt Until these new machines arrive the mails are being tak by motor car from Urusan to Fusan, where they are plac on board the Government railway ferry-steamer which tak them to Fukuoka, whence they proceed by air to the ae drome at Tachikawa, 27 miles outside Tokyo.

It is stated that the new Fokker machines will ha accommodation for five passengers in addition to the ma

It is too early as yet to form any opinion as to the succ of the undertaking, the more so as the present Salms machines are admittedly a mere makeshift. One of t principal difficulties is the deficiency of landing plac There is an adequate military aerodrome at Heijo, and t recently constructed aerodrome at Joito, near Seoul, is a now properly equipped. The latter, however, suffers fr the risk of occasional flooding during the rains of July a August. Urusan is a mere landing ground without equ ment. Emergency landing grounds between the regu halts do not yet exist, and until some more are provide may perhaps be doubted whether the service can be carr on for long without undue wastage of machines.

With the exception of one or two purely experimen flights recently undertaken with Dornier Wal flying-bo the service from Osaka to Shanghai has not yet b inaugurated, but it seems likely that this will be the n route to come into regular operation.

[The particular point to be noted is that no British craft enters into the scheme, and that apparently no nego tions are in progress to introduce British aircraft.—C. G. G.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

GIPSY ENGINES IN THE KING'S CUP RACE.

The following letter has been received from the De Havilland Co.:—

Sir,—In your comments on the King's Cup you refer to Gipsy Engines (certain of them) which "had naturally been tuned up to pretty nearly the last ounce."

On page 72 you say "the engines were tuned up to give extra power."

May I remove this misconception by assuring you that all the Gipsy Engines in the race were absolutely standard and all were identical?

(Signed) C. C. WALKER.

Carried *nem. con.* But the engines on the three speed-machines *were* revving a trifle high—which would be natural on streamlined machines with airscrews of standard type. And one does not imagine that the engines had been deemed to keep them from over-revving. So their performance was all the more remarkable.—C. G. G.

NEWS FROM NORWICH.

The Norfolk and Norwich Club has engaged Mr. R. J. Bunning, late of the Northampton Club, as Chief Instructor in place of Mr. Houston.

The Club has reduced its rates of instructional flying to 25s. an hour, so that they now have a flat rate for all flying, dual, solo, and soloists carrying passengers. The Club hopes that this reduction of 10s. an hour in their flying rates will bring enough new members to warrant a second instructor.

If necessary, sleeping accommodation on the aerodrome can be provided.

The Club Secretary, Mr. McEwen, who has for some time past been laid up with diphtheria, has now recovered and is back at work.

AN EAST AFRICAN AIR TRANSPORT COMPANY.

A new company, known as Wilson Airways, has been formed in Nairobi to provide inland and coastal services in East Africa. The controlling financial interest is held by Mrs. F. K. Wilson, and Mr. T. Campbell Black will be managing director of the new company.

The company's first machine, a D.H. Gipsy-Moth, has arrived at Mombasa, and this will be used for taxi work and instruction.

Two other machines are on order. These are a Westland IV limousine (three Cirrus-Hermes engines) and an Avro Five (three Armstrong-Siddeley Genet-Major engines). One of these machines will be fitted with floats and used on a coastal service between Mombasa, Tanga, Zanzibar, and Dar-es-Salaam. The other machine will be used for an inland service.

The intention is to provide air links with the projected Cape-to-Cairo route, and, if occasion warrants, the sea route will be extended to Beira, Portuguese East Africa, which would bring Johannesburg and Cape Town within five and seven days respectively of Nairobi.

AFTER 500 HOURS.—The Sealed Gipsy showing her paces.—(*"Aeroplane" photograph.*)

THE SEALED GIPSY.—The Gipsy-Moth, which has been flying for months with a sealed engine, doing its speed-test after flying for 500 hours without overhaul. —(*"Aeroplane" photograph.*)

THE SURREY FLYING SERVICES A.L.1.

The Surrey Flying Service A.L.1 was designed for Mr. Grant of Surrey Flying Services Ltd. nearly two years ago by Mr. A. T. Bewsher, but unfortunately circumstances have prevented much work being done on it until now. Mr. Grant says that his idea is to build this one and carry out extensive tests to insure that it is really the best for the job, before he will consider putting it on the market. It has been designed for the private owner or taxi-plane operator with upkeep as the point to be considered before all others.

No attempt has been made to get the last ounce of performance but, all the way through, particular attention has been paid to the question of wear and tear, and all bearing surfaces have been made extra large, and wherever possible all pins and bolts work in liners or distance tubes.

Description.

Type.—Two-seat side-by-side staggered biplane.

Wings.—Equal span staggered single-bay biplane. The top centre-section is carried above the fuselage on splayed-out spruce struts with wire cross-bracing. Two spruce interplane struts either side between the wings. The wings are of wooden construction with spruce and plywood box-spars and normal spruce ribs of girder type. Ailerons of the same construction as the wings are fitted to the bottom planes only and are operated by cables. The wings are braced with Raf-wires and the flying wires both go to the front spar-root fitting at the bottom longeron. The wings have not yet been made to fold but will be so in subsequent machines.

Fuselage.—The fuselage is a wire-braced wooden structure. Ash longerons of 1 in. sq. section and spruce struts. Piano wire bracing from simple plate fittings. The cockpit is arranged beneath the centre-section and comfortably seats two side-by-side. The covering is fabric.

Tailplane.—Normal cantilever construction. Box plywood spars and spruce and plywood ribs. Duralumin tube leading and trailing edges. The elevator spar is built in one piece and carries both elevators. The tail-plane is adjustable on the ground.

Undercarriage.—Straight cross-axle type. Very neat spring leg, with rubbers in compression,—the radius rod leading forward.

Power Plant.—One 95/108 h.p. Salmson A.C.7 radial air-cooled engine. Engine-mounting secured to the front of the fuselage with steel-tube structure, the engine mounted on a welded-up steel plate. Separate 3½ gallon (15.91 litres) oil-tank carried directly behind the fire-proof bulkhead which is at the back of the engine mounting. Fuel tank 18 galls. (81.83 litres) carried in the top centre-section giving gravity feed to the engine.

Accommodation.—Side-by-side with dual control. Large luggage compartment directly behind the cockpit.

Specification and Estimated Performance.

Surface 216 sq. ft., Power A.C.7 Salmson 95 h.p. Normal—108 h.p. Maximum, Weight 1,200 lbs., Power Loading 12.6 lbs./h.p.—11.1 lbs. per h.p., Loading 5.56 lbs./sq. ft., Speed 106 m.p.h.—110 m.p.h.

Rate of Climb low down.—At 95 h.p. 1,010 ft. per min., at 108 h.p. 1,170 ft. per min.

Landing speed.—45 m.p.h.

Ceiling.—21,500 ft.

Time to reach.—10,000 ft. 12.9 mins., 15,000 ft. 22.9 mins., 20,000 ft. 37.0 mins.

COMMERCE BY AEROPLANES.

The Avian agents for Queensland (Aircraft Proprietary Ltd., of Brisbane) recently had one of their machines chartered by an official of the General Motors Corporation for a tour of dealers in Queensland.

The Avian, piloted by Mr. R. S. Adair, made a round trip of 1,500 miles in a week-end of 16 flying hours whereas by normal ground methods this trip would have taken two weeks over rough roads.

A THOROUGH TEST.

The Henderson-Glenny Gadfly monoplane which was recently described and illustrated in The Aeroplane has been fitted with Pearson Rotary Ailerons, the invention of Capt. K. N. Pearson, M.C., the designer of the machine. These ailerons are guaranteed to give control after the wing itself is stalled.

By way of testing these ailerons Mr. A. A. Anderson, more commonly known as Jock Anderson, who was formerly ground-engineer at the Henderson School and is now Chief Engineer to the Henderson-Glenny outfit, took the machine up and looped, spun and rolled it,—which was a pretty good effort for a small machine of such low power.

A MARCONI SET FOR THE PRIVATE OWNER.

An extensive ground organisation exists to provide com mercial aircraft with weather reports and to inform pilot of their exact location by wireless telephony. Privat owners and pilots of light aircraft have so far been unabl to use this organisation because there has been no wireles telephony set on the market suitable either in weight or siz for light aeroplanes.

The Marconi Company have recently produced a set Typ A.D.22 which had been designed for telephony only, thoug either continuous or interrupted wave telegraphy may b received as well as telephony. With a power of 75 wat the transmitter will cover ranges of 50 to 75 miles whe communicating with the normal class of aerodrome grou stations, and with highly efficient stations such as Croyd ranges up to 100 miles may be obtained.

For normal working the set operates on the wave-leng band between 850 and 950 metres but a quick-change swit is provided so the ship's wave-length of 600 metres may used in emergency.

The set can be installed for operation by the passeng or may be fitted in any convenient part of the machine a operated by the pilot using a remote control unit, as t tuning has been simplified to "one-handle" manipulatio

The telephone transmitter and receiver are contained a wooden box 16 in. × 9 in. × 7 in. Complete with microph and telephones, wind-driven generator, accumulator, aer and connecting leads, the total weight is 60 lbs.

The essential components of the transmitter and recei are mounted in a light wooden box with strong lugs to wh rubber shock absorbers can be attached when the set is fit in the machine.

The transmitter comprises an aerial tuning inducta with adjustments and switch for 900 and 600 metre wa lengths, an oscillation valve Type M.T.5 for energising aerial circuit by means of a variable reaction coil and anode tap system on the aerial tuning inductance, an modulating system consisting of a control valve Type M. connected in series with a speech choke.

The principal components of the receiver are a tuner w slow motion condenser adjustment for high-frequency se tion, a single stage of screen-grid high-frequency mag cation with valve Type S.610, a detector with capacity action and valve Type D.E.L.610, and a low-frequency ma fication stage with valve Type D.E.L.610.

The microphone and telephones are designed for a plane work and are practically unaffected by engine no

A generator of small and light struction provides both high and tension current for the transmitter receiver, the high tension output b 1,000 volts 75 milliamperes, and the tension output being 7 volts 4 amps is fitted with a constant speed winc which is self-regulating over a ran wind speeds from 70 to 170 miles hour, thus ensuring a constant p supply.

A MINIATURE MARCONI SET.—new Marconi A.D.22 transmitting receiving set suitable for use in aircraft. With it telephony ma transmitted and continuous or rupted wave telegraphy as well as phony may be received. Its o dimensions are 16 in. by 9 in. by and it weighs complete with phone, telephones, wind-driven g tor, accumulator, aerial and co ing leads 60 lbs.

SAFETY.—Actual photograph taken from an accompanying plane of six members of the Royal Air Force jumping simultaneously with IRVIN Air Chutes from Vickers Virginia bombers.

Jump—

----Zip!

IT'S OPEN.—You're safe! Your fall stops. You rest in mid air. And then relax.

You glide smoothly, easily groundward, sharing the long-proven confidence of certain safety that Irvin Air Chutes have bred all over the world, in the minds of men who fly—and sometimes jump.

Scores and scores know what a life saver this is, from their own wide experiences in the air.

Already more than 200 aviators have been saved by use of their Irvin Air Chutes when naught else could possibly have brought them safely down.

Among these are aviators in the Air Forces of Great Britain, Japan, Sweden, Denmark, Poland and the Argentine Republic, as well as scores in the United States.

A number indeed have been saved in commercial operations.

Many of the emergencies were of the most extreme nature, and in every case the Irvin Air Chute functioned perfectly.

AIR CHUTES IRVIN TRADE MARK

After thorough investigation and rigid comparative tests, many Governments have adopted the Irvin Air Chute as the standard life-saving equipment for their Air Forces.

If extreme emergency—all unannounced as it usually comes—suddenly confronts you in the air, will you, too, be ready to meet it with Irvin confidence?

Don't be Out-of-Date

First Voice: Poor old Tomkins is so old-fashioned—he still lives in a tent and tries to stalk his dinner with a wooden club.

Second Voice: Well, he's no more out of date than are the folk who *will* go on feeding their modern motor engines with old-fashioned treacly oils. You must use Shell Oils to get the best from modern engines.

First Voice: True—but most people realise that now, I think.

DOUBLE SHELL OIL
For Daimler, Morris, Sunbeam, Wolseley, etc.

TRIPLE SHELL OIL
For Austin (all models), Bentley, Buick, Rolls Royce, etc.

ACHIEVEMENT

Alfa Romeo—Premier Award in J.C.C. Race

In the recent double 12 hours' race at Brooklands the premier award was won by an Alfa Romeo car using Shell Oil. The manufacturers of the Alfa Romeo use and recommend Triple Shell Oil.

WHEN THREE ENGINES FAILED.

Details are now available of the accident to the tri-motor Fokker FVII3m in which Mr. Donald Drew, Lt.-Commander Glen Kidston and four others were on their way to Central Africa.

The accident happened 30 miles from Mongalla, at a place called Tomba. The machine had just been diving over a herd of elephants (who became exceedingly annoyed and were evidently determined to remain non-airminded). After a dive Mr. Drew pulled the machine up, and at a height of 700 ft. all three engines cut right out without any warning.

Mr. Drew, who at the time was alone in the front cockpit, had three alternatives. He could land in the jungle, the river or the swamp. The first alternative did not seem a good plan. Apart from the dangers of landing in the jungle, the anti-airminded elephants, he thought, would behave towards him as pilots in air races do towards the handicapper. And then in the river there were the crocodiles, whose state of mind is always rather like that of a she-pilot discovering that the altitude record is still above her.

However, having heard various dance bands play "Chloe," Mr. Drew decided, in spite of possibilities of smoke and flame, if he'd got to get back to us, the swamp was the only way. He thereupon made a fine one point landing with the tail skid for 30 ft. and then touched with the wheels. The under-carriage was wiped off but the machine did not turn over. The fuselage was undamaged but ten feet of the port wing was smashed.

The cause of the engine-failure was an air lock in the petrol system. The three tanks are interconnected and the feed to all three engines comes from one central point. The tanks had emptied unevenly and one was completely empty. Following the line of least resistance, the engines sucked air from the empty tanks rather than petrol from the other two, which were two-thirds full.

Which seems to show that if you are having three engines you should have a separate petrol system for each.

Water transport was brought from Mongalla and Mr. Drew and his mechanic with native labour dismantled the machine and put it on board. It was taken to Khartoum where it had to await shipment to Holland for repairs. A new wing will be necessary, but apart from this there is not much further damage.—G. D.

THINGS WE ALL WANT.

Now that flying competitions of various sorts are so much the fashion and now that private owners are increasing and multiplying, people concerned with aviation will find a great deal of interest in the products of the Birmingham Medal Company Ltd. of Summerhill Terrace, Parade, Birmingham. This firm has for many years specialised in the making of medals, badges, trophies, cups, shields, name-plates, and in fact everything that is included in artistic metal work, all the way from an advertising souvenir to a gold cigarette box.

Private owners in these days are fond of giving their machines fancy names, and the Birmingham Medal Co. are just the people to produce really artistic plaques for this pu pose. Nearly all owners also like to have their names an addresses in neat unostentatious lettering on the machin Here again the nameplates made by the Birmingham Med Co. are just what is wanted.

At the other end of the scale, clubs, and kind-heart people who like giving prizes, will find the Birmingha Medal Co. equally well able to produce cups, shields, a special trophies of all kinds in gold, silver or any oth metal, in any size from the miniature cup such as is present to the member of a team right up to a monument the size the Schneider Trophy or bigger. And one can vouch pe sonally, as the result of more years acquaintance with t firm than one cares to recall, that their workmanship is ways excellent.

One of the firm's most successful recent products is a p fect scale model of a Moth, which may be had either a motor mascot, or as a trophy on a plinth with inscript plate. In silver-plated white metal it costs £3 3s., and hall-marked silver it costs £7 7s.,—which is remarkably ch for the workmanship and artistry in it.

Among medallions one of the neatest of the firm's p ducts is the famous medal of St. Christopher, the patron all travellers whether by sea, land, or air, without wh guardianship many people would not dare to travel. The Christopher dashboard mascot in solid silver, gilt and amelled, only costs £1. The firm's catalogues are themsel so well done that they are the best possible proof of the fir capabilities.

SAFETY FIRST IN FRANCE.

The French are beginning to feel that "safety fir should be the rule in all matters appertaining to the and the French Air Minister, M. Laurent-Eynac, has iss a decree limiting the conditions under which aeroba may be carried out, and forbidding mock aerial comb between two or more machines.

WAHABIS AND WAPITIS.

The Works of Petters Ltd., Yeovil, had an interest visitor on June 17 in the person of Sheikh Hafidh Wah Minister of Education to the Government of Ibn Sa Head of the Wahabi Sect, and King of the Hejaz and N He is at present in England as a delegate to the Po Congress. The Sheikh was conducted round the airc and engine works of the firm and expressed consider interest. He was afterwards taken for a flight in the Westland IV three-engined four-passenger limousine.

Hafidh Wahba, who has flown several times before, pressed his opinion that the Westland IV was a very si and comfortable machine.

His secretary, Ali Shukry Bey, who speaks English fectly, acted as interpreter.

Ibn Saud has a number of Petter Oil Engines insta in his palace for electric lighting and other purposes. now, no doubt, he will have a few Westland IVs for transport of his officials,—as he owns a whole fleet of already. And he might do well to order some Wapiti keep his more troublesome tribesmen in order.

NEIGHBOURS FROM NEJD.—Left to right: Mr. E. M. Benjamin, Flt. Lt. Louis Paget, Mr. P. W. Petter (Managing Director of Petters Ltd.), Sheikh Hafidh Wahba (Minister of Education to Ibn Saud), Ali Shukry Bey, Mr. T. D. Cree, Capt. R. C. Petter, Capt. G. T. R. Hill, and Mr. R. J. Norton.

CROYDON NOTES.

Imperial Airways' tea flights over London are proving extremely popular this year. To those who know their London well from the ground, it is of unfailing interest to trace well-known routes through London, spotting from the air the traffic congestion at certain points and working out wily alternative routes for the car. For flying over a great city the present weather is, of course, ideal, and many interesting discoveries can be made. A Navy Officer on leave for example, can easily spot the venerable roof of the "Goat" on account of the blue haze of fumes hovering over it.

It is said, too, that on certain days the building which houses THE AEROPLANE in Piccadilly is shrouded in a dull purple mist through which volcanic Editorial objurgations shoot upwards like red-hot cinders.

One evening Sir Sefton Brancker enlivened the evening for radio fans by broadcasting an extremely able account of what Civil Aviation had done since 1919. Sir Sefton Brancker pointed out to the British public how many of the World's pioneer flights were made by British planes and pilots, and that the first cross-Atlantic plane flight as well as the first to and fro Atlantic Airship flight was made by a British Airship. All this is extremely good for the British public who as a body seem unalterably convinced that Germany made the first cross-Atlantic Airship flight and America the first Atlantic plane flight.

Great jubilation is expressed in Air Journalistic circles over the flight of the big Dornier on Lake Constance.

Journalists accustomed for years to refer to anything from a D.H.16 with a Napier engine to an 8-seater Fokker F.VIIa as—this giant air liner or this colossus of the air—are hard at work inventing super-superlatives for the really big flying-boats which Germany has produced.

On opening our morning paper we eagerly search for some headline such as—

Aerial Brontosaurus Cleaves Skyways.

followed by an opening on the following lines—

"Described as resembling a flying Megalith of metal, hurtling with unutterable velocity through the realms space, brushing aside eagles like flies, and scuttering flocks Roc's like so many sparrows, the new German mammoth the Aetherial routes, etc., etc."

Jockeys have always favoured air travel as a means getting about. On Sunday, four of them, Gordon Richard Steve Donoghue, Fox, Lane and Richardson flew to Osten by Imperial Airways to ride in the races there. Unlucki not one of them rode a winner. Undiscouraged they return to Croydon the same evening, and Gordon Richards fl to Ayr on Monday, again by Imperial Airways. Leavi Croydon early in the morning, he reached the course abo an hour before the first race. At Ayr he rode two winne and two seconds, returning to Croydon about 10.30 p conscious of a good day's work well done. Jimmy Youell w the pilot.

Weather conditions in the Channel have been so perf lately that the oldest pilots on the air routes do not reme such visibility. From Ostende it has been possible to obt a marvellous view of the Kent and Essex coasts.

The *Southern Cross* rests on its laurels in the Croyd Hangars looking battered but contented. The history this aeroplane is interesting. It is understood to be co posed of a wing originally built in Holland and a fusel constructed in America. Both wing and fuselage, as co ponent parts of two different machines, made a trip to Arctic regions, amongst other adventures.—SPRY.

THE ARRIVAL OF "THE SOUTHERN CROSS."

The *Southern Cross* arrived at Croydon on Wednes last, July 10, at 15.22 hours.

Sir Sefton Brancker welcomed the crew. Mr. Kingsfo Smith was the pilot, Mr. Litchfield was navigator, Mr. M Williams was mechanic, and Mr. Ulm was the fourth the "companions" mentioned in the newspaper report

The machine looked weather-worn, but the way it stood up to its lengthy journeyings, and to the expos during its much-debated forced landings,—on which official inquiry has recently been held in Australia,—is str testimony to Fokker design and construction. The Mica airscrews, an American product made of some "mashe composition, do not appear to have suffered at all.

Mr. Kingsford-Smith explained that they had bought f Avro-built Fokkers which they were going to take back w them to Australia, for use on the air-line which they h to operate along the East Coast of Australia.

The following message has been received by the Ri Honourable Lord Thomson, Secretary of State for Air:—

"Please convey to the four airmen of the 'Southern Cr my heartfelt congratulations on their remarkably succes achievement after all the dangers and hardships they h experienced."

(Signed) GEORGE R.

THE AUTOGIRO WINDS ITS WAY.

The Cierva Autogiro Co. Ltd. state that Senor Rambo the Spanish Pilot of the firm, made a non-stop flight July 11 from Madrid to Lisbon in four hours agains head wind all the way. The distance along the Ta which was the route chosen, is about 350 miles.

The machine in which Senor Rambaud flew is exa similar to the one which is on show at Olympia. machine is claimed to be a great improvement on previous types of Autogiro as it includes an apparatus deflecting the slipstream from the propeller to the r blades causing them to rotate sufficiently while the mac is stationary to get it off the ground in a very much sm space than heretofore.

[Anyhow four hours for 350 miles strikes one as being an Irishman would call "a tagus journey."—C. G. G.]

AIR MAIL AND "DAILY MAIL."

The Daily Mail has been drawing the attention of readers to the advantages of the Indian Air Mail, and Harry Harper, writing in its columns, makes the p already emphasised by THE AEROPLANE, that the Post O should use the fastest means of transport available, wit surcharge. This is very sound. Another sound point f

What instruments have you on your car ?

AIRCRAFT instruments made by the British Instrument Company are well-known for the accuracy and high quality—but what instruments have you got on your car?

The Car-Thermo is a scientifically calibrated instrument which indicates, upon the instrument board, the temperature where it matters, in the cylinder head.

There is no soldering or drilling to do, the temperature responsive element is inserted through a small hole (made with a cutter supplied with the instrument) in the radiator hose, and is held in position by a neat patented method.

The Car-Thermo is made in many sizes, for flange or sunk mounting, and in different finishes, black or nickel case, silver or black dial, complete **25/-**

The Car-Thermo Safety Gauge

This dual instrument replaces the existing oil gauge and occupies the same hole in the instrument panel, and combines a high-class oil gauge with the well-known Car-Thermo.

Price **37/6** complete.

OVERHAULS.

Privileges—

The member of the Clubs incorporated in National Flying Services enjoys the benefits of belonging to a large organisation. He may land at any Club centre, enjoy the amenities of any Club, and obtain all the various services and concessions offered by the organisation—for the price of the membership of one unit.

The first to open will be the London Air Park and Country Club at Hanworth, 30 minutes from Hyde Park Corner. Here a country mansion standing in spacious grounds is being converted into an up-to-date Country Club. Surrounding it are the two aerodromes, and close to it the hangars and shops have been erected.

A limited number of members are now being admitted at the following rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-Flying members 3 gns. in each case. It is estimated that for the average member there will be no waiting, and after learning, flying charges scale down to £1.1.0 per hour The cost of learning to fly will be under £25.

A Trial Flying Lesson for £2.2.0.

There is no better way of finding out if you really would like to learn to fly than a trial lesson, which gives you half-an-hour in the air, and lets you experience the feel of the controls. The trial lessons are open to everybody and include free transport by car to and from the London Air Park, starting from Trafalgar Square; also from Olympia during the Aero Show.

Write for our booklet giving further details of the services offered to those who wish to fly.

Digitized by Google

Mr. Harper's article is that mail-planes should be operating daily instead of weekly.

What is *not* pointed out is that such a system would mean a very big capital outlay in buying new machines and increasing the staff. Still a guarantee of a ton of mail a day from the Post Office at a pre-arranged figure would be very much better than the present subsidy business,—especially for the Indian Route. A further point is that if you are going to carry a ton a day why not use modified Fairey Long Range Monoplanes? Such machines could do the whole journey in a series of long hops at a high average speed.

THE EXAMINATION OF CIVIL AIRCRAFT.

In the House of Commons on July 10 in reply to a question by Capt. Balfour, the Under-Secretary of State for Air said that there was no obligation whatever upon owners of private civil aircraft to have their aeroplanes inspected by the British Aviation Insurance Group under the arrangement made with that body in connection with the renewal of certificates of airworthiness and it rested entirely with each owner whether he would have his aircraft inspected under that arrangement or as hitherto, by Air Ministry officials.

Capt. Balfour asked whether the principle of the Air Ministry authorising private concerns to carry out the necessary examination of civil aircraft as required for the renewal of a certificate of airworthiness under the Air Navigation Act, was to be extended to applicants other than the British Aviation Insurance Group, and, if so, would the qualifications required by the Air Ministry before the granting of such powers to a civil concern be defined and published by the Air Ministry.

Mr. Montague said that the position was that two bodies, including the one mentioned, were being accepted as competent to make recommendations for the purposes of the renewal of certificates of airworthiness for privately-owned aircraft. The answer to the second part of the question was in the negative but application from other responsible bodies possessing competent inspection organisations would receive consideration.

ABOUT THAT C.I. ENGINE.

The Sunbeam Motor Car Co. Ltd., of Wolverhampton, have just issued an interesting and beautifully illustrated booklet describing the succession of Sunbeam aero-engines right away from the early 150 h.p. eight-cylinder water-cooled engine up to their latest development, the Compression-Ignition Engine type P.1.

One point of interest about the old eight-cylinder engine is that with the first of these, in a Maurice Farman long-horn biplane, there came to Brooklands a clever young mechanic from Wolverhampton named Jack Alcock, who later joined the Royal Naval Air Service, distinguished himself highly in the War, and finally won fame and a knighthood by flying the Atlantic non-stop for the first time.

Sunbeam aero-engines were also fitted to the R.34, which was the first airship to cross the Atlantic in either direction, as well as the first to cross it there and back.

The Sunbeam Co. have had little to do with Aviation in the past eight or nine years, and if their Compression-Ignition Engine should be the first British engine of its type to fly the performance would be a great feather in the cap of the enterprising Mr. Coatalen, who has already produced so many remarkable engines.

The booklet can be had post free by anybody who writes to the Sunbeam Motor Car Co. Ltd., Moorfield Works, Wolverhampton, asking for it, and mentioning THE AEROPLANE.

ACCOMMODATION.

A Furnished Flat is wanted for two years in the West or North of London. Four bedrooms. Not more than 4½ guineas a week. **Pope**, 128, Piccadilly, W.1.

NEW COMPANIES.

HELI-AIRCRAFT LTD.—Private Company. Registered July 10. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in aircraft of all descriptions, aerodrome and garage proprietors, makers of and dealers in engines and engine parts and accessories of all kinds, and things appertaining to the making of complete aircraft, motor vehicles and the like, etc. The subscribers (each with one share) are: T. A. Tyrrell, 6, Forrest Road, Victoria Park, Cardiff, clerk. G. J. Evans, Arwelfa, Abercynon, clerk. Secretary: M. Roberts. Solicitors: Phœnix Levinson and Walters, 8, Dumfries Place, Cardiff. Registered Office: 116, Clifton Street, Cardiff. [There is nothing to indicate whether the firm intends to build helicopters, or merely desires a place in the sun, for "heli" might relate either to "helix" or "helios."—C. G. G.]

NATIONAL PETROL STATIONS LTD.—Private Company. Registered July 11. Capital, £1,000 in £1 shares. Objects: To carry on the business of dealers in and distributors of petrol, motor spirit and oil, etc. The directors are: A. G. Hemsley, 1, Melvin Place, St. John's Wood, N.W.8. I. A. E. Edwards, Downe Hall, Downe, Kent. (director National Flying Services Ltd.). G. E. F. Boyes, 39, Cholmley Gardens, N.W. (director National Flying Services Ltd.). Secretary: N. I. Smith. Solicitors: Halsey Lightly and Hemsley, 32, St. James's Place, S.W. Registered Office: Grand Buildings, Trafalgar Square, W.C.2.

SIDARBLEN ENGINES LTD.—Private Company. Registered July 1. Capital, £500 in 450 ordinary and 50 founders' shares of £1 each. Objects: To acquire any inventions, relating to engines, and to carry on the business of mechanical, aeronautical and electrical engineers, electricians, founders, smiths, machinists, toolmakers, etc. The directors are: A. A. Sidney, 22, Barnes Road, Croydon, Surrey. M. C. Darby, Regent House, Kingsway, W.C.2. Lt.-Col. J. Barrett-Lennard, Regent House, Kingsway, W.C.2. Remuneration: As fixed by the company. Solicitors: Steadman Van Praagh and Gaylor, 4, Old Burlington Street, W.1. Registered office: 4, Old Burlington Street, W.1.

PERSONAL NOTICES.

DEATH.

SWAINE.—At Trowbridge, on July 11, as the result of a flying accident, Reginald Montague Swaine, Plt. Off., R.A.F.

Mr. Swaine entered the R.A.F. last March with a short service commission and was posted to No. 1 Flying Training School, Netheravon, for a course of flying instruction.

BIRTHS.

EVILL.—On July 9, at 30, Curzon Street, W.1, to Wing Cdr. and Mrs. Strathern Evill—a daughter.

McMULLIN.—On July 11, at Corriegills, Manor Road, Ruislip, to Loretta (*née* Dent), wife of C. R. McMullin—a son.

MAYO.—On July 15, at 16, Coleherne Court, S.W.5, to Thorva, wife of R. H. Mayo—a daughter.

POPE.—On July 14, at Brightwell, Woodbridge Road, Ipswich, to Pamela (*née* Cameron Young), wife of Flt. Lt. S. L. G. Pope, D.F.C., A.F.C., R.A.F.—a daughter.

ON THE AERO SHOW.

Taking it all round the Aero Show at Olympia is a really fine effort on the part of the British Aircraft Industry. If there is nothing startling or revolutionary in the design of any of the aircraft it does at any rate show that we can make aeroplanes against anybody in the World.

After all, however stupid the English business man may be in any trade, if you want to get the best thing in the World, whether it be a motor-car or a pair of boots or a suit of clothes, you have to go to England for it. And even if you want a foreign product, or an imitation of a foreign product, you can buy it better and cheaper in England than you can anywhere else.

For all our bleats about bad trade and everything else, we are the best fed and the best housed and the best clothed and the best amused people in the World. We may have more unemployed here than there are in other countries, but there is far less poverty. And altogether, jolly old England is very much to-day the Merrie England of the glorious days of good Queen Bess.

English Salesmanship.

All of which does not in the least affect the truth of the statement so often made in one form or another in this paper that so far as salesmanship is concerned the English business man is a blithering idiot. Only the other day, being driven by the heat, one went into a shop in Bond Street to buy an undergarment which had been largely advertised in the 6d. class shilling weekly papers by that particular firm as suitable for the hot weather. The people in the shop had never even heard of the garment, and when they had discovered it in their catalogue they said that they would get it from their city warehouse by next day. Now there is an absolutely typical example of English business methods in one of the very best shops in the best shopping street in the whole British Empire, which means in the world.

The salesmanship of the British Aircraft Industry collectively is just about on a par with that. The one thing that the British Aircraft Industry wanted to do, the chief reason for the existence of the Aero Show at Olympia, was to sell aviation to the British people.

At a very moderate estimate a quarter of a million people must pass Olympia every day. And Olympia happens to be so placed on a curve that it hits you slap in the eye every time you pass it by its sheer ugliness, whichever way you choose to look at it. Until the day the Show opened there was practically nothing on the outside of Olympia to tell anybody that there was going to be an Aero Show.

There were a few very dull two-by-four posters stuck on the walls, but they were only about as big as the newspaper placards on a bookstall, and they could not be read from the roadway by people in cars and buses. Over the entrance and at the corner facing Addison Road Bridge were some dead illuminated signs which would display the words "Aero Show" quite brilliantly in the dark, but fade into the fabric of the building in daylight when the lamps are off. Olympia was doing nothing for three weeks before the Show, and so by the simple expedient of sticking big placards all over the outside and putting a few banners across the road, all at a cost, at the very outside, of £100, the promoters of the Show could have told a quarter of a million people a day about the Show every day for three weeks.

Then on top of that the people who ran the Show decided to shut it at 9 o'clock in the evening,—that is to say in broad daylight,—so that their two funny little illuminated signs outside do not get to work till the people who are in Olympia are going home.

And imagine the sheer imbecility of shutting a Show at 9 o'clock when you want to sell Aviation to the British people. As Lord Thomson said at the Banquet last week, the intelligent minority of the people are those who ought to be interested in aviation, and intelligent people are busy during the day earning their livings. Even the type of lad of the village who is going to buy a private aeroplane instead of a sports car is at work at something or another during the day, and the well-to-do business man who is going to buy the family limousine is also a pretty hard worker. Added to which, the boys and girls who are going to persuade their parents to buy family limousines are either at school or at college or doing something or another during the day, and the intelligent British workman whom we want to interest in aviation is also at work during the day.

Anyhow, none of us gets away from work till about six in the evening, and then we have to go home and wash and have some food, which means that we cannot get away from home till about 7.30 and we certainly cannot get to Olympia till eight. And nobody is going to pay even 1s. to go to Olympia at eight if he or she is going to be pitched out again at nine.

Several times during the Show one has seen people in evening dress stroll in at about 8.30, evidently thinking that they were going to have at any rate two hours in which to

"The barge she sat in, like a burnished throne (Black)burned on the water: the poop was beaten gold."—
(*Antony and Cleopatra*—Act II, Scene II.)

Digitized by Google

have a look round the Show. And their faces when they were calmly told to clear out at nine were worth watching.

As a matter of fact, all of us on THE AEROPLANE were so busy over the Special Issue, and getting ready for the Show and so forth, that none of us realised till we actually went to Olympia that the Show was going to be shut at nine in the evening. If we had thought that the organisers of the Show could have been guilty of such abject foolishness there would have been quite a good deal said on the subject in THE AEROPLANE several weeks ago.

When aviation does at last succeed in this country it will most distinctly do so in spite of the people who are supposed to organise aeronautical affairs, and not because of anything they do for aviation.

Anybody of even the most moderate intelligence ought to have seen at once that people are not going to a Show to be turned out at nine with a completely spoiled evening. You cannot go anywhere after nine o'clock and you do not get value by going there before nine o'clock.

Considering that we use Summer time in this country the Show ought to be kept open till eleven. Then people could stroll down there quite comfortably after their evening meal at 8 or 8.30 or even 9 and have hours in which to play round the Show. People do not expect to come out of a theatre or a movie till after 11, so why on earth should they be asked to clear out of a Show before then?

ENTHUSIASM.

In spite of all the wailing of the Trade about lack of support in the newspapers and so forth there is no doubt about the enthusiasm of the British public if only they are allowed to go and look at aeroplanes at a time when they are free to do so. The whole of Saturday, right up till closing time, in spite of the blazing heat and all the other attractions of a London Saturday afternoon, Olympia was simply packed with people.

If only the Show had been properly advertised and if only people were given a chance it would be crowded every evening. One has expressed these views slightly more fluently in words to certain of the Show Authorities, and there is a possibility that during this week the Show may be kept open later, unless the Society of Motor Manufacturers and Traders, who apparently own most of Olympia, turn sticky about it. And if the alteration is made there will be considerable interest in watching the result. But one fears that the harm has already been done, and even if the Show should be kept open later, people will not know about i the Show is over.

AT THE OPENING.—H.R.H. the Prince of Wales, with Lord Thomson, Capt. P. D. Acland, and Mr. C. R. Fairey on the opening day.

Parachutes provided for those inspecting the machines. On the right, Sq. Ldr Waxy, cousin twice removed (by force) of the well-known Sq. Ldr. Sandbags. O.B.E.

The curious thing is that the people on the stands keen and intelligent enough for anything. One impor American visitor said that wherever he went he could full and well-informed information about the exhibits, u the American shows, where the stand attendants k nothing and the principals were in the back-offices tal sales and drinking boot-leg liquor with prospective tributing agents.

That being that, we may now proceed to discuss the S itself briefly. In this article one does not propose to with anything in detail. What is on each of the aero and aero-engine stands is described in its proper pla this issue. Next week the Staff of THE AEROPLANE will with the accessories, materials, component parts, gad and so forth.

IRON VERSUS ALUMINIUM.

The outstanding feature of the Show is the compet between steel and duralumin, and the competition bet air-cooled engines and water-cooled. Years ago one that the all-steel aeroplane was more in our line of bus than that made of aluminium alloy. To-day the situ is somewhat different, because we happen to have ir British Aluminium Company's Works in Scotland one o World's biggest sources of production of aluminium.

We import iron ore to make our steel and we in alumina and bauxite to make our aluminium. We di coal to turn the ore into steel and we make our alumi with the water supply of Scotland. Recently we have told that if we will only take the trouble to dig it up we enough iron ore in this country to make all the steel w ever likely to want. And probably in due course some will discover that we have enough alumina and bauxi the British Isles if only we will scratch for it.

And so we look like being involved in one of thos lightful competitions which are so good for trade, just the eternal war between the maker of armour-plate an maker of armour-piercing shells.

At the Aero Show you can see what can be done steel by such firms as the Bristol Company and the strong-Whitworth-Siddeley group and the Gloster Com and Boulton and Pauls. And you can see what can be with duralumin by Vickers Ltd. and Short Brothers. Fairey and the Hawker firms seem strictly neutral. timber is almost dead, as a material.

The steel people will talk to you about the corrosi

Digitized by Google

"THE record of the NAPIER engine is really marvellous.

It now holds four world's air records and three world's land speed records (over one mile, five miles and five kilometres). In addition it was fitted to the Fairey machine which made the first non-stop flight to India, and to the Supermarine seaplane which achieved the fastest speed ever attained in the air.

It was also installed in Miss England, the motor-boat with which Sir Henry Segrave won the championship."

The Effect of Those Vicious-looking Stream-lined Noses and Bodies.

A story without words.

duralumin. And the duralumin people will tell you that steel rusts. The steel people will then talk to you about rustless and stainless steel. And the duralumin people will tell you about a new silicon alloy of aluminium which is even less corrodible than stainless steel.

Between the two we should before very long arrive at aircraft in which steel is used for the purposes for which it is best fitted and in which aluminium is used also in the best way. The result will be the lightest and strongest aircraft in the World made of material which can be left lying about in sea water without any protective covering of any kind.

Then we shall be able to do without all this daubing with anoline and pasting with special protective paints, or even using aluminium and duralumin sandwiches, and all our paint and varnish people will be able to apply themselves to producing beautiful colour-schemes without having to bother about whether certain colours are adequately protective or not. And then our aeroplanes will be not only the best built in the World but the most durable and the most beautiful.—That is of course if the British business man wakes up and gets the market before America needs it.

WATER VERSUS AIR.

Among the engines we are also finding this useful competition which drives trade to wakefulness. The water-cooled engine people are getting their frontal areas down and their pressures up till they are reaching the point of talking about so many horse power to the pound instead of so many pounds to the horse power. And now they have a new line of attack through ethylene-glycol cooling, with reduced radiators and higher temperatures.

The air-cooled engine people on the other hand are pushing up their pressures and getting more horse power for their weight, and they are doing things with Townend rings and N.A.C.A. cowling which bring up the air-streams in the way they should go, and push up the speeds correspondingly.

Some of the efforts in this direction seem to be somewhat misdirected, and there is still a great deal to be learned about what the air-streams do when these rings have dealt with them. There does not seem to be much good in putting a ring all round your valve-rockers and then jambing the air under it straight into a fat exhaust pipe which has a large gap between itself and the fuselage.

THOSE RINGS.

There is no royal road to learning, and still less is there a royal road to a knowledge of what air-streams do. Even in America they do not know all about air-streams, as this little story shows.

The Lockheed monoplane with a 450 h.p. Pratt and Whitney Wasp, of the type in which Captain Aldrin of the Standard Oil Company was recently touring Europe, has a cruising speed between 150 and 155 m.p.h. Without pushing his engine all out Capt. Aldrin actually averaged 155 m.p.h. over the ground throughout his tour over Europe,—which strikes one as a very sensible touring speed for an aeroplane. That same machine with an N.A.C.A. ring has its top speed put up to nearly 200 m.p.h. and it cruises round about 170 m.p.h.

Now the N.A.C.A. tests showed that the advantage of an N.A.C.A. ring on an engine nacelle, or power-egg, such as is used on the wing-engines of two-engined or three-engined machines, is much greater than it is on any engine on the nose of a fuselage. So they fitted N.A.C.A. rings onto the wing-engines of a Ford Monoplane, exactly similar to that which is at Olympia. And they promptly knocked five miles an hour off the speed of the machine. So, as they say in America, what do you know about that?

The answer is perfectly simple. The wing engines on the Ford are so much under the wings and so high up that as soon as you put an N.A.C.A. cowling round them you get a hideous air jamb between the upper one-third of the circle of the ring and the under-side of the wing above them. If the engines were built into the leading edge of the wing probably the ring would show a very great advantage. But apparently it has not been tried as yet on a machine in which the engines are so placed.

But anyhow, there are plenty of amusing and interesting problems to be solved in this direction. One of the chief obstacles to their solution seems to be that the average aerodynamic scientist is stone blind where air-streams are concerned, and never seems to be able to visualise what the air does. The result is that he finds out in the course of about two years by laborious research in wind tunnels just about as much as he ought to be able to see in two minutes if he had any mental vision. When he has made his great discovery then a mere practical man comes along and asks him whether he could not have seen as much if he had only tried to produce a mental vision of what air-streams are doing.

CLOSING THE SUNFLOWER.

Apart from the orthodox radial air-cooled and in-line air-cooled and Vee and W and in-line water-cooled engines there are certain other developments which may alter the complexion of things altogether First of all there is the barrel type engine. There are two examples of this at the Show.

One is the Swiss Statax in which the cylinders and the airscrew all revolve together. The other is the Redrup in which the cylinders are stationary and the airscrew alone revolves. One has recently seen an Australian engine also of the barrel type, a model of which has been brought over here by Mr. Kenneth Turner, formerly R.F.C., and now a well-known engineer in Australia.

American pessimists doubtful if the Great Republic stands where it did.

THE TONIC EFFECT OF THE FORD.—America's one effort to show us how.

Digitized by Google

The Statax people claim that their engine has done about 100 hours' flying in Switzerland. No performance figures or weight-for-power figures have so far been received. When Swiss official figures are produced they will be believed without question.

The first Redrup engine ever made (it was built a good many years ago) flew in a Spartan biplane at Hamble a day or two after the Show opened. If the people behind the Redrup engine do not bump into any unexpected snags they certainly have got something which will go a very long way to further the progress of flying. Mr. M. L. Bramson, who is the moving spirit behind the engine, says that they are the first people who have successfully "closed the sunflower." The remark is apt, for in effect the arrangement of the cylinders in the Redrup is just what would be achieved by closing down the cylinders of any radial engine as some flowers close their petals at night.

Whenever anything is produced which causes something like a revolution in any line of business it is always invented by about half-a-dozen people at the same time,—without any communication with one another. The Redrup engine actually existed before the War and so did the Statax. When the pneumatic tyre was invented at least six people laid claim to it besides J. B. Dunlop and C. K. Welch about 1890. But a pneumatic tyre was actually patented and used by one Thompson in 1840. So the fact that the barrel-type engine and the swash-plate engine has been in an experimental state for years is no argument against its suddenly becoming a working proposition in this year of Grace.

COMPRESSION-IGNITION.

Then on top of that we have the various compression-ignition engines. The Sunbeam people have one at the Show which, one gathers, has run successfully on the bench. The Bristol people have been running a compression-ignition engine as a single-cylinder experimental unit for several years. The Beardmore compression-ignition engines for the airship R.101 has been running on test-benches for months, though at a power considerably lower than that which was originally claimed for them. The Junkers compression-ignition engine has been flying steadily in Germany. And some quite long cross-country flights have been made with the Packard radial air-cooled compression-ignition engine.

So much has been published about the success of the Packard that certain information which one has gathered from certain American friends at Olympia may be interesting.

In the first place the Packard is not running on heavy fuel-oil. It is running on a light grade of oil which is almost a kerosene. That probably makes the job easier. On the other hand, by making it easier it gives the firm a chance of doing experiments with the engine which they could not do if they kept it to the crude oil ideal and were still unable to get off the ground.

Apparently in the Packard design nothing has been done to take care to excessive pressures by way of blow-off valves or anything of that sort. The designer has simply used the best stuff he knew and has left it to look after itself.

The cylinders are not screwed into the crankcases or held down by rods or anything of that sort. They are made with extended feet which sit on the crankcase and butt up against one another. And then steel straps are put round on top of the feet and tightened up with turnbuckles behind and in front of the cylinders, thus forcing them down onto the

THE ASPIRING AVRO.—Or the Antelope that can't elope,—because it is under the gallery.

In Fairey lands forlorn

crankcase, and apparently taking care of all tendencies the cylinders to blow themselves off.

When the machine with the Packard engine lands a the pilot turns off his fuel pumps the engine goes running on its own lubricating oil, and at one aerodrome pipe-line from the oil-tank had to be disconnected bef the engine would consent to stop.

Also our American friends say that after every cro country flight of any considerable distance the engine taken to pieces and reconditioned. Which strikes one being a very right and proper thing to do. There is noth like experimenting under working conditions.

There anyhow are a few major points which may studied by those who go to the Show during the four d which remain after this issue of THE AEROPLANE appe And here are a few more of a minor kind.

HOW TO JUDGE EFFICIENCY.

By this time we ought to realise that to get the best va out of our engine-power, and to get an aeroplane wh will give us enough speed over the ground to make us dependent of the ordinary 30 or 40 m.p.h. wind, we m have high speed. And that means efficiency.

One has come to the conclusion that the best way judge an aeroplane at the Show is to stand in front o with an imaginary axe in your hand and see how ma bits and pieces and excrescences and lumps and knobs could knock off it with the idea of diminishing its he resistance.

Then imagine the whole thing laid out in a big gene arrangement drawing and imagine yourself with a b pencil in your fist and see how many corners can be tur into curves.

The fewer bits there are to be knocked off and the fe corners there are to be abolished the better is the aeropla ninety-nine times out of a hundred. As one has said e where, some of our high-brow designers are stone blind.

Without mentioning any names, there are two makes aircraft in the Show which probably have higher perfo ances with the same engines than anything else. One them is designed by an engineering team, each member which is a brilliant specialist in his own way, and the wh lot are over-looked by one man whose only form of ar ment is to say "That will do," or "Take it away." others are designed chiefly by a man who started life a working carpenter, or wood-butcher as we used to call in the old days, who educated himself at night schools so became a scientist with a real practical knowledge. immediate boss, when one first met him, was one of the fir engine mechanics who ever lived, and to-day he is a n with a great deal of money, a vast amount of business se a thorough knowledge of practical mechanical engineeri and a natural eye for an aeroplane which prompts him go round and knock off the corners.

In each of those firms the scientist is in his proper pla He is just used to tell the practical engineer why his pr tical ideas work, or do not work, as the case may be. because the practical man is at the top, he has in each c managed to collect scientists whose calculations come with amazing accuracy.

When once the scientist comes to the top then perfo

ance goes to pieces, because he is always ready to prove by mathematics that low performance is due to mistakes on the part of the practical engineer.

Some Things to Avoid.

There are one or two other points which seem worth mentioning in this article, for consideration by buyers and designers alike.

There seems to be a tendency among designers of cabin machines, more especially in the larger sizes, to put a pilot alone in a cockpit separate from his passengers. This strikes one as dangerous. If anything should happen to the pilot, if he should be taken ill or if he should die suddenly, the wretched passengers are condemned to a comparatively lingering death while the machine is going down to crash.

If the driver of a car faints or passes out suddenly there is precious little time to think about anything. But a passenger sitting alongside him who happens to have presence of mind can at any rate grab the wheel and hold the car straight and kick the gears out or switch off or do something. In an aeroplane flying at any reasonable height across country there is heaps of time to pull the pilot away from his controls and for somebody else to take charge.

Any person who is not a pilot, but has done a reasonable amount of flying, ought to be able to make a sporting shot at getting a machine down either in a big field or at the next aerodrome, without killing anybody. So one holds that it is very bad policy to shut the pilot away from the passengers.

At the same time he ought not be jambed up alongside passengers who in a moment of hysteria might grab him by the neck when just coming down to land.

The Place for Engines.

So far as general design is concerned there is not much advance shown by the designers of any country. Everybody seems to disagree about the right place for engines.

Some people build their engines right back into the leading edges of their wings. One is convinced that that is all wrong. The wings spoil a good airscrew and the airscrew spoils a good wing. When the engines are stuck a long way out, as they are in the Rohrbachs, this effect is probably not so bad.

When the designer sticks his engine up on top of a mon plane wing on trestles as does Herr Dornier and Herr Roh bach, and as Mr. Knowler has done on the Saro *Cutty Sar* the centre of thrust must obviously be too high, and must b counteracted by giving a negative set to the tailplane. O the other hand, engines stuck up in that way ought to b very much more efficient than engines which have to pus the slipstream of their airscrews either past a wing through a whole lot of struts and wires and things.

Personally one would very much like to try the experime of turning the engines of the *Cutty Sark* the other wa round, so as to make them into pushers, and then conne ing them by a wing of very small chord extending mere from the front of the engine mountings to the tail of t engine, and projecting on each side just so far as such a wi could be taken as a cantilever.

Low-Wing Tractors.

There seems to be a tendency in these days to make lo wing single-seat tractor fighters. The fighter on the Vick Stand is one example. And machines of that type have be built, though they are not being shown, by Boulton a Paul and the Westland people and De Havillands. Th is a good deal to be said for this type of machine as a fight Capt. Frank Barnwell knew it when he built the Bris Monoplane in 1915.

If your machine is fast enough there is no need to wo about what is underneath your wings. All that conce you is what is in front of your gun-sights and whether th is anything likely to pounce on you from above. But th are vast possibilities in a low-wing, pusher fighter.

Another minor point about our general design is t surely by this date we ought to have given up the use tail-skids and we ought to have adopted wheel brakes a trailing tail wheels as standard fittings? In these days can get wheels with brakes which weigh precious little m than our old wheels used to weigh without brakes.

Both in commercial machines and war machines the ting of brakes would save a good many minor accide But brakes in conjunction with tail skids are likely to c a great many deaths. If you jamb on a brake on one wh and spin the machine round on it, sooner or later you going to twist the tail clean off the aeroplane. But it pr ably will not come off till the machine is in the air.

PROGRESS.—The Dornier Do.x, with twelve Jupiter engines, flying over Lake Leman (or Constance).

Our Guests.

Among the most pleasing things in the Show are the exhibits by our friends from Germany, France and Italy. That they should be crowded into the annexe at the end of the Main Hall is a pity, but it could not very well be helped. All the big Stands in the Main Hall and the New Hall were allotted by ballot to British commercial firms. And after all the Aero Show is primarily organised for the benefit of the British Aircraft Industry.

The exhibits in the annexe have in a way an advantage, in that they are not overshadowed by galleries, and in fact are in a better light than any of the stands in the Main Hall or the New Hall.

All three countries deserve to be congratulated on their exhibits.

The German machines have that splendid solidity which is typical of German design and workmanship. Yet we know from experience that those solid-looking metal machines fly just as well as any others in the World. And, judging by the list of World's Records, they fly a great de better than some.

The French machines show that ingenuity which is typically French. And the various gadgets on the Fren Stand are also full of clever ideas.

The Italian exhibit proves once more, as every exhibiti of Italian products of any kind always proves, that t artist-artisan still exists in Italy. Aerodynamic scienti may possibly criticise some of the Italian design, but nobo can find fault with the beautiful Italian workmanship a the artistic finish which is put on everything produced Italian aviation.

We certainly owe a great debt of gratitude to our frie on the Continent for sending us these composite exhib and giving us such a splendid opportunity of compar their ideas and their workmanship with our own.

Hereafter the long-suffering reader will find a few rema on the way in which we have endeavoured to entertain visitors from other countries. And thereafter will be fo the Stand to Stand report of the Show itself.—C. G. G.

ENTERTAINING OUR GUESTS.

On Thursday, July 18, the Society of British Aircraft Constructors entertained to dinner at the Savoy a number of distinguished visitors from other countries, and invited to meet them representatives of all the exhibitors at the Aero Show at Olympia. In justice to the organisers of the affair the fact must be recorded that the entertainment was worthy of the occasion. Having attended similar functions in Berlin and in Paris one can say that, without pretending that we surpassed in any way the hospitality of our hosts on the Continent, we did at any rate give for once as good as we have received in the past.

The Lord Thomson, of Cardington, proposing the toast of the Aircraft Industries of all Nations, said that he imagined that this toast had been committed to him because as he was in power for the time being he was the head of a State Department which was the best customer of the British Aircraft Industry. He hoped that whoever occupied his position 10 years hence would not represent the Industry's best customer. That the Government should be the best customer was a state of affairs which was unnatural and unhealthy.

He hoped to see before he died an air transport system in this country as great as the British Mercantile Marine, supported by an Aircraft Industry as great as our Shipbuilding Industry. And he hoped that the Aircraft Industry of that future would never suffer from such troubles as those which had afflicted shipping of late years.

In thinking over this subject he had reflected on the life history of the Aircraft Industry. It was born before the War a sickly and puling child. He himself as an officer of the General Staff was sent down to Aldershot to report on Mr. S. F. Cody's kites and at that time he regarded Aviation from the point of view of a military Staff Officer as being mildly ridiculous.

When War came the infant Aircraft Industry was subjected to forcible feeding. It was crammed with good things and it was given too much money. It enjoyed a surfeit of good times. He wondered whether even Mr. Handley Page would deny those good times.

Then came peace, and military orders stopped. The infant was left in the cold like a hot-house plant on a bleak hillside. Many men who had dreamed great dreams suffered disappointment.

Looking at this as a philosopher, and not as a Secretar State, his sympathy was with the Aircraft Industry. W he looked back twenty years he found that only two of constructors of those days were with us to-day, namely Short and Mr. Handley Page. [In this statement L Thomson is not strictly accurate. Mr. Robert Blackb was certainly building aircraft twenty years ago. Sir All Roe is still building aircraft,—though in partnership w Mr. Saunders and not in his own name. Mr. G. H. Han syde is with the Desoutter Company. There are many le lights of the aircraft industry to-day who were actively c cerned with making aircraft twenty years ago, but t naturally do not affect Lord Thomson's argument, as he specifically referring to people building aircraft in th days who are still building aircraft under the same name C. G. G.]

Our Visitors.

Referring to our distinguished visitors from foreign pa Lord Thomson welcomed them and thanked them for hav honoured this banquet with their presence. He refer specially to His Royal Highness Prince Purachatra of Si He, Lord Thomson, was associated with Prince Purach so long ago as 1902 when he was instructing that Princ military engineering. And in those days, as cox of the b of the Royal Military Academy, Prince Purachatra cur him (Lord Thomson) at bow even then showed a remark command of the English language.

Prince Purachatra, he said, was now here not only as brother of the ruling monarch of Siam but as the Mini of Postal Services and Communications in that country.

Turning to the Aero Show itself, Lord Thomson said it was truly International in character. He himself as unrepentant believer in lighter-than-air craft hoped tha future shows more attention would be given to airships.

The Show was in a sense unique. If it did not m advance it would be a failure. Unwillingly his fel citizens had to admit that we were making progress.

On the opening day of the Show he had the honou accompanying the Prince of Wales round the Show. Prince had shown the adaptability of the typical mo man and his vivid interest in and understanding of airc was remarkable. So far the British Public had not sh the interest which was expected of them.

A ROYAL PILOT.—The Infante Don Alfonso of Spain, while visiting the works of the Bristol Aeroplane Co. Ltd., flew the Bristol Bulldog machine with that skill for which he is so well known. The group on the right of the picture, reading from the middle, comprise: Don Alfonso, Senor Carlos de Quiros, Mr. C. F. Uwins (the Bristol pilot), and M. Robert Esnault-Pelterie (who claims to be the inventor of the type of control-column commonly known as the joy-stick). On the extreme left are Capt. Bartlett and Mr. Burgoine, who represent the Bristol Co. abroad.

On the other hand, the people who had shown their interest by coming to the Aero Show were obviously the more intelligent members of the community, and were therefore a minority. Also intelligent people were busy making a living and had not much time to spend at the Show. But he hoped to see a change in this matter during the week-end.

A Word to the Press.

Lord Thomson then appealed to the Newspapers to support the Show more strongly. He said that the newspapers so far had done the Show fairly well, but *only* fairly. He would like to see them advertise it even more. He asked them to give it even half the publicity which they would give to an air disaster.

Supposing, he said, a pilot at the Royal Air Force Display had crashed into the crowd, the whole world would have echoed with it. Could not the Press give part of such publicity to the Aero Show? If only the people of the country were *allowed* to know what there was to be seen at the Show the intelligent minority would overflow Olympia.

[Naturally this biting irony of Lord Thomson's drew enthusiastic applause from his audience. The Press have deserved it. But we could expect nothing more from the Press than we have had. And we must remember that a nation always has the newspapers, as well as the Government, which it deserves.

Those who know anything of the English Press, or rather of those who control the Press and those who are employed by them to edit their newspapers, must realise that from the newspaper point of view there is no story in the Aero Show and no money in it, and that therefore it is not worth the space due to or the work involved by a decent murder or even a first-class street explosion.

Before we entered the banquet hall a friend who is connected with our best newspaper brought along a man representing one of the popular daily papers and asked one to tell him who there was of note among this great assembly. One pointed out to him a few people who having made Aeronautical History on the Continent and in this country and have by doing so indirectly influenced the history of the whole World. One pointed out to him a few men who have made World History direct, and are making World History without having had much to do with aircraft construction.

They were of no interest to him. He wanted to know whether we had not got any famous foreign pilots there, people round whose name he could hang what the newspaper people call a story, and he seemed quite at a loss when one explained that the men who were there that evening were the men who paid his popular heroes, as aerial chauffeurs or jockeys, to do things for them.

To such a man, and to such editors as he serves, a trans-Atlantic stowaway placed next the Chairman at such a banquet would make it worth a double column heading. But they would find nothing of importance in the personality of a Dr. Junkers or a Dr. Dornier, or in the presence of such men as our Messrs. Fairey and Siddeley and Sopwith and Fedden, who have shown us and are showing us how to build up the reputation of British Aircraft. Nor would they see anything significant in the presence of Mr. McCracken, who has charge of all Civil Aviation in the United States, or of the representatives of the great American aircraft constructors who were present.

Under such circumstances Lord Thomson was justified in adopting a kill-or-cure policy towards the Press, in that they can now do no harm to the Show by being huffy at his remarks and ignoring it, whereas they may do a bit of good if his irony spurs them into some show of intelligence.

The only person likely to suffer is Lord Thomson himself, in that he may by his remarks have created for himself a bad press. However, Lord Thomson is a fighting man by nature. And being a Labour minister he cannot expect any of the popular papers to say anything good about him, and so he can afford not to care. But all the same he does deserve the thanks of the British Aircraft Industry for having told the Press exactly what the Aircraft Industry thinks about it.

Having done the same thing oneself for pretty nearly 20 years one knows the result. Just about the finest compliment one has ever had was paid when a friend quoted one's opinion on some aeronautical subject to somebody connected with newspapers, and the newspaper man said "Oh! We don't think much of *him* in Fleet Street." One could not wish for a better epitaph.—C. G. G.]

In conclusion Lord Thomson said that we had at this banquet constructors, designers, scientists and other distinguished visitors of all lands. They were all fighting together as a progressive minority against prejudice. For the public mind was always against any innovation. Let this show be remembered as particularly noteworthy. Aviation would in the end bring all countries together.

The Trade's Reply.

Mr. Handley Page, replying, said that he spoke as the collective representative of the Aircraft Industries of the World. He referred to the period before the War as, in the words of the Bible, "Those time of ignorance God winked at." [Acts 17-30.—C. G. G.]

We could see in the Exhibition groups of people talking in all languages and yet all talking the one aeronautical language. There had been no such gathering since Pentecost.

Referring to airships he said that politicians naturally turned from heavier than air craft to the delightful gas bag, and he hoped that they would see the error of their ways.

When Lord Thomson referred to the fact that Mr. Shor and himself (H.P.) were the sole survivors of twenty year ago he felt that he was becoming less a constructor than curiosity. He said that the Exhibition was showing th brains and ability of the Aircraft Industry and it was wort telling to the world at large. Twenty years ago the questio about any aeroplane at a show was "Will it fly?", that morn ing his old friend Mr. Sopwith had asked "Is there any thing in the Show that won't fly?" and he had replied tha there was not, except for the good-looking fuselage of forty-seater passenger machine on his own (H.P.'s) stand.

As indicating the power of the Press he said that one pape had published the statement that there was in the Show single-seat fighter which would do 300 m.p.h., and he unde stood that when this statement appeared the whole of th Air Council with all their staffs had embarked for Olympi In fact we had to-day aeroplanes which would do 200 m.p. at 20,000 ft. and would climb to the top of Mount Evere incredibly quickly. He referred also to the confidence show by the pilots who embarked in the Fairey Long Range Mon plane on an English Winter day clad in tropical kit, con dent that their next sleep would be in India.

He drew attention to the enormous development in th last ten years, particularly with reference to the aircraft d signed to pack into a submarine, [Mr. Pemberton Billing scheme of 1914.—C. G. G.], and the great twelve-engine Dornier, and the 40-seater passenger machines whic modesty forbad him to mention.

There was no need he said for a universal language convince people about aviation. What could be more co vincing than the Farman which flew to the Far East an back in 17 days. What could be more convincing than th apostolic work done by Charles Lindbergh. In the end was the courage of the individual which carried convictio

There had been no exhibit equal to that of Olympia sin Solomon showed his treasures to the Queen of Sheba—an he hoped that visitors would likewise take souvenirs aw with them.

People, he said, were apt to overlook the work which w

A NEW world is unfolding . . . Just as the discovery of America gave a fresh impetus to the imagination and daring of Europe, so the discovery of this New World in the Sky is sweeping men and women of imagination into new realms of accomplishment . . . for the sheer joy and thrill of travelling through space, for the betterment of their business.

THREE MILLION MILES OF SAFETY FLYING

The Ford All-Metal Tri-motored Monoplanes have covered over three million miles in regular service without passenger accident.

They pioneered in mail service, and to such an extent has this service grown in America that letters by air mail are now sent at less than half the cost of special delivery postage.

Not only in Government flying, but as railroad auxiliaries, as carriers between the great industrial cities, they have proved that their reliability is absolute.

* * *

Ford Monoplanes are of duralumin construction — strong as structural steel and only one-third as heavy. These planes can be left out of doors for long periods without harm; only cleaning is required to prevent corrosion.

All-metal, the strength of any part can be gauged accurately, its serviceable life accurately assessed. With all-metal construction the terrible risk of fire is eliminated.

* * *

Ford Monoplanes have three engines. They can climb on two only. Even with one the angle of descent can be extended to cover an area of a thousand square miles.

put into aircraft. The work which was put into British aircraft was overlooked from its birth to the grave by the Aeronautical Inspection Directorate. And this gave British Aircraft a World-wide cachet and recognition where aircraft were known.

In conclusion he said that we could not have progress without a fixed policy of progress and research. He thanked Lord Thomson for his kind words to the Industry. He said how much honoured the Exhibition had been by having the Prince of Wales to open it. And he hoped that they would have as good a Show next time.

AN ORATORICAL ACHIEVEMENT.

PRINCE PURACHATRA OF SIAM proposing the toast of Civil Aviation, in perfect English, said that in spite of Lord Thomson he felt some diffidence in addressing this gathering after such speeches and so many Biblical allusions, though he admitted that Civil Aviation was a subject so soul-stirring as to overcome diffidence.

He said that he had the greatest conviction in the future of Civil Aviation. He had often wondered what such pioneers as Borelli had aimed at. Had they a vision of the importance of aerial navigation or had they merely a personal ambition to imitate the angels?

In the East legend and myth and folk-lore had always held fliers as gods or demi-gods. Human beings were not given the power to fly. But he thought the Wright brothers knew what they were about when they began flying. He reminded those present that the Wilbur Wright Memorial Lecture would be given on Thursday next the 25th. And he referred to the importance of Civil Aviation to the British Empire. [Here by some strange lapse of discipline on the part of the Savoy management waiters were allowed to promenade the room filling glasses, and talking to visitors about what they would have, an act of astonishing discourtesy to a distinguished visitor when he was speaking, and incidentally preventing one from hearing what he said.—C. G. G.]

Finally Prince Purachatra said that he hoped that the Press would rally people to this Exhibition of Aviation. In Siam they held Civil Aviation high. Even the peasants in the field knew that Aviation was doing something for them. They had been running air-mails for six years and the workpeople knew that they got their letters sooner and that if there was urgent need for medical attention it would be brought to them by aircraft.

THE HONORABLE W. P. MCCRACKEN, JUNIOR, Assistant Secretary of Commerce for Aeronautics in the United States, replying, asked whether there could be anything more significant of the influences of Civil Aviation than this toast proposed in England by a member of the Ruling House of a nation in the East and responded to by a representative from the Western Hemisphere?

He remarked that having been told that speeches were to be of five minutes' duration he had been, in the course of the evening, endeavouring to compute the expansion ratio of a five minutes' speech. [Roughly it is 9 to 1.—C. G. G.]

He suggested that he had rather expected that the point of view of the Industry would be "you drop your money in the slot and the machines will do the rest." [His reference presumably being to the way in which capital is being dropped into the Aircraft Industry in the States. We here have not yet reached that happy stage.—C. G. G.]

He said that there were still surprises at Olympia. He expressed his deep appreciation to our hosts. Some people, said Mr. McCracken, thought that Civil Aviation was a romance. It was not a romance it was very practical, but there was plenty of romance in it.

Civil Aviation should be the servant of mankind. It should serve man with transportation, crop dusting, air-mail work, and survey. It was also a great help in recreation, for it gave people more places to go to from the strain of the great cities. And Civil Aviation would do much in promoting the comradeship of nations. Even if one did not know the language it was easy to make oneself understood among aviators. And Mr. McCracken ended by quoting *Locksley Hall* on the subject of the Parliament of man and the Federation of the World.

Mr. C. R. FAIREY, proposing the health of the Chairman, said that it was only on such occasions as this that one heard him called Captain P. D. Acland. More generally his friends called him Peter. Mr. Fairey said that he would refer only to our Chairman's public work, in that he had been on the Council of the S.B.A.C. for nine years and was one of those people whose work showed in itself and not in the amount that he talked about it.

CAPTAIN PETER ACLAND, replying, said that this was about the proudest evening in his life and he had never hoped to preside over such a distinguished gathering.—C. G. G.

AT THE HESTON GARDEN PARTY.—Mr. O'Konnor, of the Swedish Army, flying the Junkers-Bristol-engined fighter. Capt. Barnwell's Bristol Lucifer is in the foreground and the Bristol Bulldog on the left, and a Fairey IIIF behind it. The huge tower in the background is the 300-feet gasometer about which so much agitation is being raised. The flying people at Heston regard it as a useful landmark. The elegant people among the machines are mostly trespassers onto the aerodrome from the select enclosure. Altogether there were sixty-seven more or less civil aircraft on the ground.

THE HESTON GARDEN PARTY.

AT HESTON.—Before the crowd arrived, the Junkers monoplanes (Bristols) demonstrating round the Social Focus. (*"Aeroplane" photograph.*)

On July 20 the Royal Aero Club, in conjunction with Messrs. Norman and Muntz, who are Airwork Ltd., the proprietors of the Heston Air Park, gave an aerial garden party which was quite the most successful gathering of the kind yet held in this country. There were 67 machines on the aerodrome, which in itself must be pretty well a record for civil aircraft so far as England is concerned. Also there were thousands of people, mostly of the class who ought to be interested in flying and hitherto have not been. And, in spite of the intense heat, everybody seemed to enjoy themselves immensely.

When one arrived at Heston shortly after midday there was a plague of small flies which made one think of Biblical Egypt. It was not that the flies meant any harm, and they did not bite, but there were too many of them in proportion to the number of people. Later on, when humanity also arrived in flocks, the fly-to-man ratio became more reasonable, and the plague ceased. But before this stage had been reached Mr. Will Hay, as broadcaster, had announced to the early arrivals that he was informed on the highest medical authority that the flies were non-poisonous and only meant to be friendly.

The Royal Aero Club, plus those public benefactors, J. Lyons and Co., Ltd., put on a free tea in a big marquee which was described as one of the best he had ever had by a visitor who is notably finicky about his food. Teas in the little restaurant of the Social Focus were not so good as all that, but then, the small staff was terribly overworked.

THE RALLYE.

The first event on the programme was an International Air Rallye. It was not particularly international, because the only competitor who came across the Channel was Lo Carbery. However, he himself is international enough f a crowd, seeing that he is an Irish Peer who has tried renounce his title, has taken on American citizenship, h adopted a mis-spelling of his Baronial title for a surnar instead of his family name, and flew from Cassel in a G man aeroplane with a British engine—and lives in Kenya.

The winner of the competition was Mr. Thorne, of t R.A.E., who flew from Teignmouth, in Devon, a matter 150 miles, in the Avian QN, the second was Mr. Cazalet, Duxford, in Cambridgeshire, who flew his famous Widge RM up to Newcastle, and came down thence as a competi to Heston. And John Evans-Freke, Baron Carbery—oth wise Mr. Carberry—was a very sporting third.

Mr. Kemp, the Newcastle Club instructor, also compet but did not win the Rallye competition, and unfortunat arrived too late to take part in the Club Instructors' ac batic competition.

Dr. Dixon and Mr. John Bell also flew from Newcas And Flt.-Lt. Travers, Instructor of the London Aeropl Club, flew from London to Brough, in Yorkshire, with M Scaramanga as passenger, in a Club Moth, and came the to Heston in competition.

There was some idea of working up a huge Internatio Rallye with the aid of one of the London newspapers, there was not enough time to make a big show of it, so newspaper people, very wisely from their point of v backed out. Personally one thinks that Messrs. Norman Muntz and Airwork, Ltd., and the Heston Air-Park, do very well if they keep quite clear of newspaper boosti

If they go on as they have begun, bringing the r

people by invitation and inducing them to become members of the Club at Heston, not as a flying club but as a social club, they will make Heston the Hurlingham of aviation. And the public of the right kind will come there automatically if they are allowed to pay to come into a well-equipped and comfortable enclosure.

Possibly Stamford Bridge and Harringay, and other places where they provide Dirt Track Racing and Dog Racing, and so forth, may be better-paying propositions than Hurlingham or Ranelagh. But personally one would prefer to own Hurlingham. And if Airwork, Ltd., aspire in that direction they will avoid everything in the way of newspaper boosting and cheap stunts.

Let them provide plenty of passenger flying in good-class machines and so forth at reasonable prices. But let them equally avoid advertising "Joy-Rides," which itself is a vulgar expression, and let them especially avoid advertising, as has been done by other firms, 5s. a roll, or two half-rolls for 5s. It is too much like "Twice Round the Bay in the *Skylark* for Half a Dollar, and a Bob Back if you are Sea-Sick."

Heston Air Park has already acquired something of that Public School atmosphere which is so sadly lacking everywhere else. And it will do well to preserve it jealously, even though doing so may postpone the period at which Heston will provide vast wealth for its enterprising young proprietors.

THE JUNKERS FIGHTERS.

The first display of the programme, just when people were beginning to arrive, was a demonstration by two Junkers monoplanes. These two machines are among the best jokes of the Great Peace. During the week sundry of our German friends at Olympia have been coming along with broad smiles and saying: "Have you seen our—I beg your pardon, I mean the Swedish—new fighters at Heston?" And when one arrived at Heston one began to see the joke still better.

There they were, two Junkers monoplanes of entirely new types, one with two engines and one with a single engine. The engines are Bristol-built Jupiters of the very latest types, because Scandinavia is the only part of Europe i which British-built Jupiters can be sold—all the rest bein under licence to the Gnôme-Rhône Co., of Paris. The ma chines bear Swedish civil markings, because although the were designed at Staaken they were at any rate put togeth at the Junkers works in Sweden, and they simply brist all over with gun-rings and bomb-racks.

They have twin rudders stuck out on the ends of the tails so that the man in the after gun-ring can shoot straigl down the back of the fuselage without fear of hitting h own rudders. And the twin-engine machine has a gu tunnel underneath the fuselage much after the fashion our old enemies the Gothas.

They flew round and round in front of the enclosure a height of a few hundred feet, with the little machine si ting on the big machine's tail. And, every now and then, they passed by, some curious opening through the gun-tunn and the after cockpit of the big machine caused such sudden glare of light that one would have sworn to the fla of a machine-gun.

The whole effect was rather grim and very beautiful, a the numerous R.A.F. officers who were about simply lov it. Herr Willi Neuenhofer, the holder of the World's Heig Record, was flying the smaller machine, and the big o was flown by a well-known Swedish Army pilot, with t curiously un-Swedish name of O'Konnor. Later on in t day they really showed what they could do.

Another very good show was put up by Mr. George Bulma on the Hawker Hart, with a Rolls-Royce F engine. T Hart, which has already been illustrated copiously in T AEROPLANE, is quite one of the best two-seat fighters produc anywhere. Its top speed is somewhere over 180 m.p.h., a it has all the manœuvrability of a single-seater. And M Bulman is, apart from his ability as a test pilot, quite t most able demonstrator in this country. One has not m any other pilot who can show off an aeroplane at every co ceivable angle to anybody at a certain place on the grou in the same way as he can. And he certainly showed off t

Hart so that everybody at Heston must have recognised its fine performance and excellent lines.

A lot of flying was also done by a Westland IV., which seemed to be very busy taking passengers.

The aerobatic competition for instructors of the Light Aeroplane Clubs was rather a wash-out, as the only competitors were Mr. F. R. Matthews, of the London Club, and Mr. Bartlett, of the Bristol Club. And each of them is such an extraordinarily good pilot that there was nothing to choose between them.

WHEN A MODEL IS NOT A MODEL.

Following this came a demonstration of model aeroplanes by aircraft apprentices and others belonging to the Halton Model Aircraft Society, and by a number of members of the Society of Model Aeronautical Engineers.

This display carried one back some 20 years to the days when people who are now prominent in the aircraft industry used to do such things on Wimbledon Common and Streatham Common—much to the annoyance of the indigenous inhabitants. One has distinct recollections of such a gathering at which there appeared a long, slim young man named C. R. Fairey, who, without arguing with the other people, who generally used to conduct those meetings in what the late Mark Twain called "a furious state of French calm," merely produced a model which proceeded to wipe all the rest off the map—very much as on certain occasions he has done so with full-size aeroplanes since.

These models amused the flying people intensely, and interested them quite a lot, especially one model, which solemnly circumnavigated the Social Focus and came back almost to its owner's hand. Some of the models kept themselves in the air for four or five minutes at a stretch. Incidentally, one used the word "models" in a purely complimentary sense, because these elastic-driven flying-machines are things apart, which bear no resemblance to any gas-driven aircraft in the heavens above or on the earth beneath, here or hereafter, and they involve a technique which is entirely their own and is apt to be extremely misleading when applied to gasoline-kites unless a high order of intelligence is applied to differentiate between them.

The machines flown by the Halton Model Aircraft Society put up a much better performance than those of the Society of Model Aeronautical Engineers. This seems very right and proper, for one has met so many engineers who are models, according to their degrees and certificates and diplomas and so forth, whose aircraft were far from being models of their species.

This demonstration was greatly aided by the humours of Mr. Will Hay at the broad-blasting machine. From the control-tower of the Social Focus he could see exactly what was going on, and his comments on three-point landings, "two wheels and the propeller," and so forth, were quite worth hearing.

AEROBATICS.

After this came one of the best shows of aerobatic flying that one has ever seen. Mr. Staniland on a Simmonds Spartan threw the machine about in a way which showed that the symmetrical section has nothing to fear from its more orthodox competitors. Mr. Bartlett on a Bristol Club Moth performed with the greatest elegance. Herr Fitz Classen on a Klemm monoplane with a Salmson engine fell about the sky in a way which made one doubt at times whether his machine was a real aeroplane or one of the elastic-driven models. Mr. Hubert Broad did all those things with a Moth which he alone seems able to do. Mr. G. Murray also flew a Moth very well indeed.

Mr. A. M. Blake flew a Blackburn Lincock (Armstrong Siddeley Lynx) quite well, but, being more or less strange to the machine, his performance quite lacked the dash and precision and that consummate finish to each manœuvre which Sergeant Lowdell has accustomed us to seeing wherever the Lincock has appeared hitherto.

But the star performances were undoubtedly those of Mr. Cyril Uwins, in the Bristol Bulldog, Herr Willi Neuenhofer, in the Junkers K47, and Mr. O'Konnor, in the Junkers K37.

One of our German friends had explained that of course the little Junkers could not show itself off properly at such a show as this, because, having a super-charged Jupiter, its performance only began at 15,000ft.—which would be inconveniently high for the spectators. Nevertheless, considering that the little Junkers is a two-seat fighter with a machine gun ring behind the pilot, it did not leave very much to be done. It did flick-rolls and slow-rolls, and loops and spins quite as neatly as any single-seater one has seen.

And, naturally, it was very impressive to all us because we are not accustomed to seeing a low-wing monoplane of any kind being thrown about the sky at high speeds like our Gamecocks and the Lincock.

The big twin-engined job was even more impressive. The pilot did what looked very like flick-rolls with it somewhere between 200 and 300ft. from the ground. It looped in quite a small circle with the most delightful accuracy and steadiness. But its most impressive manœuvre, though probably it was simple enough to do, was a spin from somewhere about 2,000ft. to somewhere about 500ft.—in which the machine appeared to be coming down absolutely vertically and spinning round its own axis. The tail simply seemed to twist round and round instead of flying out like a flail, as most machines do in a tail-spin. Both the Junkers pilots are extraordinarily good, but they could not have done what they did with those machines unless the machines also had been quite exceptional.

The landings of both the Junker machines are a trifle emotioning to watch, especially that of the single-seater, in which the rudders are completely outside the slip-stream so that the pilot has no control on the ground. Like all low-wing machines, they seem to kite for an enormous distance before sitting on the ground. The single-engine fighter when landing runs straight for 100 yards or so and then swings round to the right in a most disconcerting way. Future machines of these types will have wheel-brakes and tail-wheels and then will be very manœuvrable on the ground.

After these two machines had landed and had been parked in their allotted positions, R.A.F. people in the audience went and patted them and cooed over them.

THE STAR TURN.

But with all said and done, much the prettiest show of the lot for sheer grace and address was that of Mr. Uwins, in the Bristol Bulldog. He also had a super-charged engine

which could not be let full out near the ground. But he was still able to show what can be done by a consummate artist on a machine which is properly controllable.

Captain Frank Barnwell, the designer of the Bulldog, is himself a very able pilot. Many years ago he said that his ideal aeroplane was the biggest possible engine with the smallest possible aeroplane stuck on it. He designed the Bristol fighter, which does not accord with that specification. But, all the same, it was the World's very best aeroplane of its time, and did more than any other one machine to win for us the mastery of the air in France.

He designed the Bristol monoplane fighter which, if it had ever been properly used when it was first built, would have wiped the sky clean of all other fighters.

Of late years Capt. Barnwell has been doing an enormous amount of research work, and has built many interesting machines. But he has always been his own most merciless critic, and has never been particularly pleased with anything that he has built. The Bulldog apparently very nearly pleases him. And at a rough guess one would say that its performance is a good many per cent. better than that of any single-seater in the world with a radial engine.

At about ground level its top speed is close on 170 m.p.h., but above 15,000ft., with its super-charger in full blast, it is doing something well over 200 m.p.h., and that is with full load of petrol and guns and ammunition. On the dive it can be pushed up to somewhere about 300 m.p.h. So here we have at last an interceptor fighter which has quite a sporting chance of intercepting something.

To appreciate Mr. Uwins' performance, one has to remember that he was flying a high-speed fighting machine of considerable weight. Instead of jerking it round corners and flopping it over upside down, he flies it with that particular grace which we have so seldon seen since the late Squadron-Leader Longton used to fly a Camel—in a series of graceful curves. Mr. Uwins never seems to fetch his machine round a corner. He always seems to be writing curly things in the sky.

Even when he does an almost vertical dive and then goes up again almost vertically, there is no jerk at the bottom of the dive, and when he does an upward spin on his climb the machine seems to be doing it quite easily and naturally, without any of the flick which commonly goes with this trick.

Announcement of the result of the competition was rather surprising. The first prize went to Mr. Broad, the second to Mr. Murray, and the third to Herr Neuenhofer. Nobody would deny for a moment the cleverness of Mr. Broad's performance on a Moth. Still less would one deny that Herr Neuenhofer deserved a prize. Mr. Murray certainly deserved a prize for flying so well, and so did several of the other competitors.

But, personally, Mr. Uwins' performance seemed so far in front of anything else that one can only imagine that the judges forgot all about him. One has seen the winner of a race forgotten in just the same way because he was so far in front of the rest that nobody believed he had finished.

The last official event of the day was a parachute descent from a Moth by Mr. Tranum. As usual, he judged his landing exactly, and came down well in view of all the spectators. He was using a British Russell Lobe parachute and he delayed the opening of it for what looked like a good 500ft. after he had left the machine. When he did open his parachute there was no doubt about it, for he fetched up with a terrific jerk.

After that there was a good deal of desultory flying by all and sundry. But the bulk of the spectators must have got well away before the storm hit the aerodrome.

Altogether it was a thoroughly jolly afternoon, and one only hopes that Airwork, Ltd., will arrange a good many more like it before the end of the year, if the weather holds good. Even quite late in the autumn there would be a good deal of pleasure to be got out of going down to Heston for an hour or two's flying after leaving the office, and then having a simple meal, so long as it was well served, in the restaurant before coming back to Town.—C. G. G.

THE NEW CHAIRMAN OF THE ROYAL AERO CLUB.

The Royal Aero Club has now stated that the Chairman of the Club for the forthcoming year will be Sir Philip Sassoon, Bart., G.B.E., C.M.G., Under-Secretary of State for Air in the late Government. The office of Chairman has become vacant as the previous Chairman of the Club, the Right Honourable Lord Thomson of Cardington, has been appointed Secretary of State for Air.

No better Chairman than Sir Philip Sassoon could have been chosen for the very important and critical period which lies immediately in front of the Sport of Flying in this country. And the Royal Aero Club is to be congratulated on having acquired Sir Philip as its Chairman.

The proper function of the Royal Aero Club is to govern the Sport of Flying in this country, and to represent British sporting flying on the councils of the *Fédération Aéronautique Internationale,* which governs all international questions of sporting flying. And naturally the Club should do all that lies in its power to raise the tone of sporting flying, and to keep the sport clean and honourable. Also, naturally, the tone and behaviour of members and their friends in the Club should be above reproach.

Within a few weeks the Aero Club will be grappling at close quarters with all the problems which hang round the contest for the Schneider Trophy. Theoretically the Contest is purely a sporting affair like any international yacht race or horse race or golf competition. In practice it has developed into an International affair of the first magnitude.

Officers of the Flying Services of all the nations concerned in the Contest, and in fact of all nations which belong to the *Fédération Aéronautique Internationale,* have to do with the Schneider Contest. The Italian pilots and the one American pilot and our pilots are all serving officers. The French pilots are civilians but they have all been officers in the French Flying Service and they have the status of officers.

Moreover the French and Italian and our aircraft have been built at the expense of their respective Governments, and only the American entry is financed privately.

Under such circumstances the whole affair becomes of first-class international importance, and any little unpleasantness between local authorities and visiting pilots and their crews, or between officious people on the water endowed with a little brief authority and our visitors, might well assume the importance of an international incident unless handled with tact by the Royal Aero Club.

Likewise, apart from the actual period of the competition, there will be many important people coming over before the contest, and possibly remaining over after the contest, who will have to be treated in a manner fitting to their position. Obviously therefore any Chairman of the Aero Club who is to uphold the dignity of this country during such a period must be a man with wide knowledge of the World and much tact and ability.

All these qualities Sir Philip Sassoon has in a high degree. Those of us who were at Venice heard him speak to a vast assembly of our Italian hosts in excellent Italian,—at any rate so we were told by our Italian friends though Sir Philip himself may disclaim any command of fluent Italian. His French at any rate is that of Paris of to-day, and not of the Paris of Chaucer's Abbess.

As Private Secretary to Field-Marshal Sir Douglas Haig during the latter part of the War 1914-18 Sir Philip came into contact with the higher military officers of the Allied Powers, and in his personal capacity he knows most of the statesmen and politicians of Europe. He has all the natural ability which goes to make a diplomat, and he has had enough experience to qualify for a high place in the Foreign Office.

He has that extraordinary quality of never forgetting a name or a face, as so many quite insignificant people in the Royal Air Force know so well. He has a very fine sense of humour, as any reader of his book *The Third Route* may judge. And he has a habit of getting things done the way he wants them done.

His keen interest in aviation has been shown during his period in office as Under-Secretary of State for Air by the way in which he has flown all over the British Isles and very nearly from one end of the British Empire to the other. But no greater proof of his attachment to and belief in aviation can be found than the fact that he should be willing to devote his time and his high abilities to the Royal Aero Club.

We may reasonably hope that with Sir Philip Sassoon as Chairman the Royal Aero Club, which should obviously be an organisation of great weight and dignity, as befits its position as the controlling body of the Sport of Aviation in the United Kingdom, may at last, with the opportunities which now lie before it, attain to the position of high repute which its Royal title obliges.—C. G. G.

THE CIVIL AIR BALL.

What is the matter with the Air League, apart from its anti-Air Ministry propaganda, is simply lack of any proper sense of dignity. Considered as a cheery party for a lot of people in the Aircraft Industry, all of whom know one another, the Civil Aviation Ball at the Grosvenor House Hotel on Friday night might not have been at all a bad show if the entertainment or cabaret part had been cut out. But considered as an entertainment to which the Royal Aero Club and the Aircraft Industry could take foreign visitors of importance with the idea of showing them the kind of hospitality which English visitors have received abroad it was merely lamentable.

First of all, instead of being allowed to park wraps in the regular cloak room, the in-coming guest was herded down some stone steps with iron railings and was "presented" to the leading spirits of the Air League by a uniformed Toast-Master while wrestling with hats, coats, shawls, handbags or whatnots. Then he found himself in a vast subterranean hall which is normally, one gathers, an artificial ice skating-rink, but on that particular evening was more like the hot room of a Turkish bath. The dance floor was temporary,—and felt like it.

Before descending to this cavern, and after reaching it, the guest was pestered by persistent young women to buy for five shillings apiece buttonholes and/or programmes which chiefly consisted of advertisements.

This sort of thing may be all right at a dance hall in Montmartre, but it is not the kind of thing to inflict on a guest at a function backed by such a grandiose title as the Air League of the British Empire.

The band was fair, but seemed to be playing to a metronome rather than to a baton. At intervals the dancing was interrupted by bits of a cabaret show, which might have gone reasonably well at a minor music-hall.

There was one long interval, during which several good-natured people well-known in Civil Aviation launched onto the dance-floor a number of rubber-driven aeroplanes of the kind which are not models of anything, and performed rather less efficiently than those with which some of the notable people in the Aircraft Industry used to play on Streatham Common twenty years ago. This was supposed to inculcate airmindedness into the assembled multitude composed entirely of habitués of aviation.

Somewhere about 02.00 hours on the Saturday morning there was a tableau, pageant, or display, consisting of a number of enthusiastic females who were dressed presumably to represent component parts of the British Empire, with Britannia as the culminating personage, rather after the style put up at provincial Lord Mayors' shows, or for the grand procession of a travelling circus following the band-wagon, and labelled "The Apotheosis of Britannia."

Supported by a chorus of gondoliers, or Corsican peasants or something of that sort, kindly lent for the occasion by one of the touring opera companies at present in the London area, the tableau sang *Tipperary, Pack Up Your Troubles,* and *Rule Britannia* with considerable vigour, winding up with a thunderous production of *Land of Hope and Glory,*—which, considering that, according to plan at any rate, the guests should have included a number of those who fought against us in the inter-tribal squabble of twelve years or so ago, besides the representatives of that particular nation whose alleged superiority in the air is being continually rammed down our throats by the Air League, scarcely seemed tactful.

To give the tableau an adequate aeronautical flavour a number of young women swathed in the latest thing in ladies' natty flying suitings (*vide* adverts) were interspersed among the components of the British Empire,—and when they turned round displayed the name of Burberry behind.

Before the singing began two persons in Sidcot suits posed in front of the rest of the group and lit cigarettes, presumably to indicate the nonchalance of the war aviator, and at the end the poor old Union Jack was flapped with vigour. The nausea produced amongst some of the audience can best be understood by reading that story in Stalkey and Co. in which Mr. Kipling describes the soul-upheaving activities of the jelly-bellied-flag-flapper.

If the Air League is going to do this sort of thing it is past praying for, even after the influence of Brig.-General P. R. C. Groves has been removed.

Either the thing should have been done properly or it should have been left alone. Members of the Aircraft Industry who wanted to entertain their friends from abroad could have taken them to any of a number of quite cheap night-clubs where they would have had a better floor and a better band, food and drink that was as good, and possibly rather better waiting. The only other alternative should have been a properly arranged ball at one of the great houses of London at which people of real importance in the social world and in politics would have been present.—C. G. G.

The pilot's safeguard *against FIRE*

The life of the pilot and those of his passengers may depend upon the efficiency of the fire fighting equipment installed in his machine. No other fire extinguisher can compare with the "ESSEX" for use in aircraft of every type. After exacting tests the "ESSEX" has been adopted by the Air Ministry for use in R.A.F. machines and in aircraft flying on British Air Lines *because it is the most efficient.*

The wonderful new liquid in the "ESSEX" *smothers* a petrol fire instantaneously and, in addition, the "ESSEX" is very light in weight—it does *not* generate poisonous fumes—it does *not* conduct electricity and it cannot possibly get out of order.

Since the "ESSEX" is hermetically sealed and the liquid cannot corrode the jet or container it *always* comes into instant action. And only one hand is needed to operate the "ESSEX"—no pumping is necessary.

Insist on the

ESSEX

The Safe Extinguisher

Entirely British Made

The "ESSEX" was installed on all the flying boats of the "Empire Cruise" and is fitted in both the giant Airships R.100 and R.101

THE CHALLENGE INTERNATIONALE DE TOURISME.

On Aug. 3 an International Light Aeroplane Round Europe Contest will begin at Orly. This competition will embrace certain qualifying and eliminating tests at Orly after which all contestants will fly round Europe following the route shown on the accompanying map, and returning to Orly on Aug. 20.

A total entry of 82 pilots and machines has been received. Of the pilots, 32 will be German, 17 French, 14 Italian, 5 British, 4 Czecho-Slovak, 2 Belgian, 2 Swiss, 2 Yugoslav, and 1 each American, Brazilian, Canadian and Austrian, entered through the Aero Clubs of Germany, France, Italy, Czechoslovakia and Switzerland.

The only British entries are 4 D.H. Moths and 1 Simmonds Spartan, which have been entered through the *Aéro Club de France*, as the Royal Aero Club did not see fit to support the competition. But a very large proportion of the engines will be British.

There is a very large prize list apart from the *Challenge Internationale de Tourisme* which will be awarded to the winner of the Contest.

Each of the official bodies of the countries visited by the competing aircraft has contributed to the prize list, and in addition the various Aero Clubs are awarding special prizes for its own nationals.

THE AEROPLANE proposes to deal fully with this contest at a later date.

THE AIR RALLY AT SCARBOROUGH.

An Air Rally is being arranged at Scarborough during the August Holidays which should provide an interesting and amusing week-end for private owners.

Substantial cash prizes are being offered. In the "On to Scarborough" Rally, the first machine will receive £15, the second machine £10, the third £7, the fourth machine £5. In addition, the first lady passenger will receive £7 7s. and the second lady passenger £5 5s.

Various events have been arranged, including an Open Handicap Race with cash prizes of £10 and £5, also a Balloon Bursting Competition with prizes to the value of £5 for the winner and £3 for the second. Certain professional pilots will be present to do crazy flying and stunting.

Private Owners and Club pilots are cordially invited.

The old racecourse is being used as an aerodrome and is very large and the surface excellent.

The aviation party will stay at the Grand Hotel, Scarborough, and a pleasant holiday seems assured for any pilot able to attend.

Those intending to be present are asked to communicate with Northern Air Lines (M/c) Ltd., Wythenshawe Aerodrome, Northenden, Cheshire, who will send full particulars and arrange accommodation if required.

THE TWENTIETH ANNIVERSARY OF THE FIRST CROSS-CHANNEL FLIGHT.

The Twentieth Anniversary of the first flight across the Channel, which was made by M. Louis Blériot, who landed on the Cliffs at Dover in a Blériot Type XI monoplane, falls on July 25. M. Blériot had intended to celebrate this anniversary by crossing in one of the latest type Blériot passenger-carrying aeroplanes and landing at Dover on that day, as near as possible to the site of his first landing,—on which a Memorial now stands.

Unfortunately, owing to his engagements in France, he has been obliged to postpone his crossing until Saturday, July 27.

On that day a squadron of the Royal Air Force will meet him over mid-Channel to escort him to Dover, and a landing will be made at 14.30 hrs. at the old R.A.F. aerodrome on Swingate Down, about a mile from Dover Castle, where assistance will be provided by the Automobile Association.

Here he will be received by the Mayor of Dover, Mr. Hilton E. Russell, and conveyed by car to the Blériot Memorial, where a reception will be held by the Mayor,—after which M. Blériot will return to Swingate and leave by air for Croydon at 15.45 hrs.

On arriving at Croydon at 16.30 hrs. he will be received by The Secretary of State for Air, Lord Thomson of Cardington; the Director of Civil Aviation, Air Vice-Marshal Sir Sefton Brancker; representatives of Imperial Airways Ltd.; the President of the Royal Aeronautical Society, Col. the Master of Sempill; Mr. H. E. Perrin, representing the Royal Aero Club, and others.

In the evening M. Blériot will be a guest of honour at the Banquet given by the Society of British Aircraft Constructors at the Savoy Hotel, and during the proceedings a presentation will be made on behalf of the proprietors of *The Daily Mail*.

M. Blériot hopes to leave London at an early hour on Sunday morning, July 28, to be present at Calais, where celebrations, including a Rallye of light aeroplanes, are being held.

THE ROYAL AIR FORCE.

The London Gazette.

July 16.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Air Commodore P. F. M. Fellowes, D.S.O., relinquishes his appointment as Air Aide-de-Camp to his Majesty the King on promotion to Air rank (July 1).

The following Plt. Offs. on probation are confirmed in rank (May 25):—J. C. Allan, P. J. Connolly, J. Coverdale, J. Cox, P. J. J. Cullinan, T. W. G. Eady, J. K. Flower, J. C. Harcombe, G. A. E. Harkness, C. V. Howes, R. Louis, A. C. Mitchell, E. C. Passmore, R. C. I. Pearse, P. K. Robertson, J. R. Robins, E. Rotheram, R. E. Watts, J. Wilson.

The following are promoted with effect from July 17:—FLIGHT LIEUTENANTS TO BE SQUADRON LEADERS.—G. W. Bentley, D.F.C., M. F. Browne, H. H. James, O.B.E., J. S. T. Fall, D.S.C., A.F.C., E. J. D. Routh, E. L. P. Morgan, E. H. Hooper, R. Young, H. S. Scroggs, E. F. Turner, A.F.C., C. Boumphrey, D.F.C.

FLYING OFFICERS TO BE FLIGHT LIEUTENATS.—A. E. Rogenhagen, N. H. N. Fletcher, C. F. H. Grace, R. E. B. Rose (Hon. Flt. Lt.), O. B. Swain, M. C. W. C. Flint, M.C., R. W. M. Hall (Hon. Flt. Lt.), R. Duncanson, A. L. R. Duke, H. E. E. Weblin (Hon. Flt. Lt.), F. L. Woledge (Hon. Flt. Lt.), F. G. Cator, M. E. B. P. Storrie, R. A. A. Cole, H. W. Raeburn, F. G. Jennings, F. Boston, T. B. Prickman, H. M. S. Wright, H. M. Whittle, A. E. Paish.

The following Plt. Offs. are promoted to the rank of Flg. Off.:—P. G. Thompson (Mar. 10); R. David (April 9); K. F. Jones (April 9); R. A. Chignell (June 9); S. O. Bufton (June 16) (with seniority of June 9); H. A. Constantine (June 17); S. R. Groom (June 17).

Air Vice-Marshal A. E. Borton, C.B., C.M.G., D.S.O., A.F.C., is placed on the half-pay list, scale A, on relinquishing the appointment of Director of Personal Services, Air Ministry (July 1).

Wing Cdr. G. H. Bowman, D.S.O., M.C., D.F.C., is placed on the half-pay list, scale B (June 7 to Aug. 8 inclusive). Flt. Lt. R. de L. Stedman is placed on the retired list at his own request (July 9).

The following Flg. Offs. are transferred to the Reserve:—CLASS A.—E. L. Leader (July 5) (substituted for notification in *Gazette* of July 9); E. H. Newman (July 15); H. N. Davies (July 16). CLASS C.—A. T. S. Studdert (July 15).

Plt. Off. L. Currie resigns his perm. comn. (July 12). Flg. Off. D. K. Hewison relinquishes his S.S. comn. on account of ill-health (July 16). The S.S. comn. of Plt. Off. on probation L. I. Gibson is terminated on cessation of duty (July 17).

ACCOUNTANT BRANCH.—The following Plt. Offs. on probation are confirmed in rank and promoted to the rank of Flg. Off. (June 11):—M. L. Jones, C. V. Mears, R. Trippett.

MEDICAL BRANCH.—H. C. S. Pimblett, M.B., is granted a S.S. comn. as a Flg. Off. for three years on the active list with effect from July 2, and with seniority of July 2, 1928. The S.S. comn. of Flg. Off. C. Crowley, M.B., is antedated to July 2, 1928, and he ceases to be seconded to the Manor House Hospital, Golders Green (July 2). Flt. Lt. J. Twohill, M.B., is transferred to the Reserve, Class D ii (July 13).

CHAPLAINS BRANCH.—The Rev. T. A. P. King is granted a S.S. comn. as a Chaplain with the relative rank of Sq. Ldr. (July 3).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation:—G. J. Konried, R. S. Sikes (June 24); J. K. Watson (June 25); E. C. Fieldsen, N. D. B. Wood (July 1); D. Hay (July 3). The following Plt. Offs. of the Special Reserve are promoted to the rank of Flg. Off.:—J. Sillery (Aug. 15, 1928); J. F. Bristow (June 21). The following Plt. Offs. on probation are confirmed in rank:—M. J. R. Alderson, H. T. Edgecombe, D. R. Gray, G. J. E. Howard (July 10); S. R. Herringshaw, G. Leggatt (July 11); T. H. W. Beadle, N. F. Marsh (July 16). Flg. Off. O. V. Lee is transferred from Class A to Class C (July 12).

The following Flg. Offs. relinquish their comns. on completion of service:—E. K. Clifford (June 27); A. L. Harris (June 28); T. J. Shaw (July 5).

Flt. Lt. S. Wallingford relinquishes his comn. on appointment to a comn. in the New Zealand Permanent Air Force (June 21). The comn. of Plt. Off. on probation H. C. W. Brewer is terminated on cessation of duty (May 30).

STORES BRANCH.—Flt. Lt. H. W. Clarke relinquishes his comn. on completion of service and is permitted to retain his rank (June 17).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 601 (COUNTY OF LONDON) (BOMBER) SQUADRON.—The following Flg. Off. to be Flt. Lt.:—J. J. Parkes (July 5).

Appointments.

Week ending July 22.

GENERAL DUTIES BRANCH.—Flight Lieutenants J. W. Colquhoun, to H.M.S. *Hermes*, 27/6, instead of 13/5, as previously stated. E. H. Hooper, to R.A.F. Record Office, Ruislip, 10/7. H. L. P. Lester, to A.G. School, Eastchurch, 16/7. F. F. Garraway, to No. 35 Sqdn., Bircham Newton, 28/7.

Flying Officer S. R. Sherman, to Armoured Car Wing, Iraq, 15/6.

MEDICAL BRANCH.—Flight Lieutenant A. Harvey, M.B., to R.A.F Hospital, Cranwell, 19/8.

STORES BRANCH.—Flight Lieutenant A. H. Allan, to R.A.F. Depot Uxbridge, 11/6.

Flying Officer J. W. Stokes, to Station H.Q., Hal Far, Mediterranean 21/6.

Air Aide-de-Camps.

His Majesty the King has been graciously pleased to ap prove that an officer of the R.A.F. who has held the ap pointment of Principal Air Aide-de-Camp to the King sha be permitted to continue to wear the silver crown an Royal Cypher in monogram style after he has relinquishe his appointment.

The silver crown and Royal Cypher will be worn as in dicated below:—

(1) *Full Dress.—Device*—height 1 in., width ⅞ in.—will be placed o the shoulder straps so that the lowest portion of the device is o inch from the bottom of the shoulder strap. The bird and crow will be removed.

(2) *Mess Dress.*—Device in miniature—height ⅞ in., width ⅞ in. will be placed over the ranking lace so that the lowest edge is lev with the lowest edge of the lace.

The device will not be worn with service dress or on th shoulder straps of the great-coat.

Fatal Accidents.

The Air Ministry regrets to announce that as the resu of an accident off Skipsea, East Yorkshire, to a Fair IIIF machine of No. 207 (Bomber) Squadron, Eastchur on July 17, Flg. Off. Stanley Frank Prince, the pilot of t aircraft, and 363348 L-AC. Edward William Buttensha were killed.

At the inquest at Hornsea on July 18, Flt. Lt. Combe expressed opinion that the accident was caused by an attempt on the part the pilot to roll too low.

The Coroner in registering a verdict of Accidental Death com mented Flt. Combe on having swum out to the machine a the accident in an attempt at rescue.

The Air Ministry regrets to announce that as the result an accident near Boreham Wood, Hertfordshire, to a D.H of a reserve civil flying school on July 19, Plt. Off. Wal Patrick Dillon Bennett, Reserve of Air Force Officers, pilot and sole occupant of the machine, was killed.

The R.A.F. Staff College.

The following officers have been selected for the 8th Course at the R.A.F. Staff College, beginning in January, 1930:—

Wing Cdr. G. R. M. Reid, D.S.O., M.C.

Sq. Ldrs. H. H. McL. Fraser, F. Fernihough, G. G. Dawson, F. G. M. Williams, W. R. Cox, M.C.

Flt. Lts. J. W. Baker, M.C., D.F.C., C. A. Bouchier, D.F.C., T. G. Bowler, G. M. Bryer, O.B.E. A.F.C., E. S. Burns, E. I. Bussell, S. D. Culley, D.S.O., C. R. Davidson, M.C., A. B. Ellwood, D.S.C., O. R. Gayford, D.F.C., C. F. Horsley, M.C., D. d'H. Humphreys, G. M. Knocker, G. Martyn, H. D. O'Neill, A.F.C., R. S. Sorley, D.S.C., D.F.C.

The following officers passed the qualifying examination held on Mar. 26, 27, and 28, 1929, and will be eligible for consideration, if recommended by their C.O.s, for the 9th Course at the Staff College, beginning in January, 1931:—

Sq. Ldr. C. W. Mackey.

Flt. Lts. J. L. Airey, D.F.C., J. S. Chick, M.C., A.F.C., A. P. Davidson, E. D. H. Davies, R. A George, M.C., G. C. O'Donnell, D.F.C., C. E. V. Porter, H. V. Rowley, E. H. Searle, F. A. Skoulding, G. F. Smylie, D.S.C., S. E. Storrar, E. J. D. Townsend.

Royal Australian Air Force.—The following officers passed the qualifying examination:—

Sq. Ldr. F. W. F. Lucas, Flt. Lts. F. M. Bladin, G. Packer, D. E. L. Wilson.

Royal Canadian Air Force.—The following officers passed the qualifying examination:—

Flt. Lts. A. Ferrier, G. R. Howsam, G. E. Wait.

The Coast Defence Co-operation Flight.

The Coast Defence Co-operation Flight has been temporarily detached from the Armament and Gunnery School, Eastchurch, and has moved to a temporary landing ground near Plymouth. Up to and including Aug. 2 correspondence for this Unit should be addressed to R.A.F., Crown Hill, Plymouth, Devon. The telephone number is Crown Hill (Plymouth) 276, and the telegraphic address is Aeronautics, Crown Hill, Plymouth.

Permanent Commissions.

The following Medical Officers have been accepted provisionally for permanent commissions in the R.A.F.:—

Flt. Lts. R. J. Irving Bell and James Hill, M.B. Flg. Offs. G. T. O'Brien, G. H. J. Williams, J. C. Melly, B.A., and J. Kemp, M.B.

None of the above-named officers will be required to refund the difference between the war service gratuity of a permanent officer and that of a temporary officer.

A Court Martial at Worthy Down.

A District Court Martial was held at Worthy Down on July 18, when First Class Aircraftman William Charles Baldwin, of No. 7 (Bomber) Squadron, was charged with the commission of an act likely to cause damage to aircraft in that, at Worthy Down on July 2, not being a qualified service pilot or pupil under instruction, without authority, he flew a Vickers Virginia aircraft, which act occasioned damage to the extent of £3,150, or thereabouts.

A summary of the evidence stated that on the morning of July 2 orders were given for a Vickers Virginia bombing machine to be got ready for a flying officer to go up. Baldwin was left in the cockpit with instructions from a serjeant to run the engines until they were warm, and to switch them off if the pilot had not arrived when that occurred.

Baldwin, in a statement read to the Court, said that when he was sitting in the cockpit, running up the engines, he was seized with a sudden impulse to fly the machine. He jumped from the machine, removed the chocks that held the port wheels, got back and took off. After flying for about 20 minutes he decided to return to the camp, but, owing to low clouds, missed the aerodrome. He, therefore, turned to the south to reach the sea and so recover his position. He reached the sea near the Isle of Wight, and then flew back to the camp.

He explained his crash on landing by saying that the weight of petrol in the machine made his angle too steep when he glided down to the aerodrome. That made the machine jump into the air when it touched the ground. Had the machine been less heavily loaded, he thought the landing would have been successful and his comrades would have been spared much hard work.

Flt. Lt. Rogers, who defended Baldwin, said that the case was without precedent. If a previous case had occurred surely regulations would have been framed with a view to guarding against a recurrence and he could find no such regulations. He submitted that there was ample time for somebody in authority to have been warned when it was seen that Baldwin intended to fly the machine, or perhaps to have diverted Baldwin from his sudden impulse. Baldwin was an ex aircraft apprentice from Halton, and was very keen on his work. It would be a great pity if that one foolish act should prevent the young man from achieving what was probably his greatest desire—to fly. The act was not contemplated or done with a view to notoriety. It was not done out of bravado, or as the result of a bet. It was the result of a thrilling thought which came to Baldwin. The chance to fly came, and the impulse was too great to resist. Baldwin threw himself on the mercy of the Court.

The findings of the Court will be promulgated later.

Special Assessments.

The following officer and airmen have been awarded special assessments on completion of an *ab initio* course of flying at No. 2 Flying Training School:—

Special Distinction.—Flt. Lt. B. F. Cox.

Distinguished Pass.—No. 364780 Act.-Sjt. A. Strungell and No. 3641 Act.-Sjt. C. E. Slee.

Notations have been made accordingly in the official records.

The R.34 Re-Union Dinner.

The first re-union dinner of those who were the crew of the R.34 on her double crossing of the Atlantic ten years ago was held at Bedford on July 20. Major G. H. Scott, who was Captain of the Airship, was in the Chair.

The R.34's complement of officers and men on her journey was 33 and of these 14 attended the dinner.

The company honoured in silence the memory of Brig. Gen. E. M. Maitland, Maj. Pritchard and Lieut.-Cmdr. Lansdowne, U.S.A., who have been killed in airship service since the flight.

Among those present were Wing Cdr. G. H. Cook (navigator of R.34, Flt. Lt. R. F. Durrant (W/T officer of R.34) and Flg. Off. H. F. Luck (2nd officer of R.34).

A GERMAN SCARE.

A German newspaper of Bolshevik tendencies, the *Welt am Abend*, claims to have disclosed the existence of a clandestine naval school of aviation on the island of Norderney.

This school is said to be run by the Severa company, one of the creations of the notorious Capt. Lohmann. The head of the school is a naval captain and the instructors are former naval aviators. The course, which lasts for a year, is confined to naval personnel and the usual number of pupils is between forty and fifty. They are not transferred in the usual way, but nominally, on one pretext or another, leave the navy altogether for the period of training. When they rejoin the navy the term of their aviation course counts for pension purposes.

The expenses of the school are, according to the newspaper, "defrayed out of a mysterious fund from which Capt. Lohmann financed his bacon factories and 'patriotic' companies."

If anyone wants to know the truth about this yarn they are recommended to apply to Herr von Gronau, of the Verkehrsfliegerschule.

THE SHOW REPORT.

BRITISH AND FOREIGN AEROPLANES.

A GENERAL VIEW.—Looking down the Main Hall, showing on the left the nose of the Fairey Long-Range Monoplane, the skeleton Fairey IIIF, the Blackburn Nile, and in the distance the Boulton and Paul Sidestrand and the Short Singapore. On the left are the principal engine stands.

A.B.C. MOTORS LTD., Walton-on-Thames. Stand No. 13.

A.B.C. Motors have a comparatively microscopic stand whereon they show a miniature single-seat cabin monoplane with the 40 h.p. A.B.C. Scorpion engine, known as the Robin. Judging from the pictures in the daily press this machine "tickled the fancy" of those individuals who take on themselves the responsibility of telling the public what they are to be interested in. Nevertheless it is an exceedingly attractive little vehicle, but one volunteers the suggestion that the colour scheme of black and orange is not well chosen. Black is too funereal and in some peculiar way the square fuselage painted black looks like a railway sleeper.

The cockpit or cabin is extraordinary for its roominess and is well furnished. All controls appear to be tucked away and yet are accessible, there is an ample side-door, an openable roof and a hinging wind-screen so that there can be no complaints about inaccessibility.

Mr. "Tony" Fletcher, the designer, is highly pleased wi himself about his first A.B.C. aeroplane product. His weig estimate came out exact on the scales, and all his perfor ance figures were exceeded by a comfortable margin.

One of the minor interesting details about the machine that the wheels are retained on the axles by a quick relea pin so that when a wheel wants changing it is not necessa to grovel in the mud or dust of an aerodrome with make-sh tools, but merely to turn the pin with thumb and fore-fing and the wheel is off.

The Robin sells at £375, a reasonable enough figure. [O wishes the A.B.C. Company the best of luck with their n venture, but one is not convinced that there is any co siderable market for the single-seat two-cylinder type. St as *Punch* said, in a famous book-review,—"for those w like this sort of thing this is exactly the kind of thing th will like."—C. G. G.]

THE AVRO-ARMSTRONG STAND.—The Avro Five and the Avro Ten three-engined monoplanes with Armstrong Siddeley engines.—(" *Aeroplane* " *photograph.*)

SIR W. G. ARMSTRONG WHITWORTH AIRCRAFT LTD., Coventry. Stand No. 87.

The Armstrong Whitworth Aircraft firm show on the combined Stand, with the Avro Company, three aircraft. These are the Atlas two-seat Army Co-operation biplane, the Siskin IIIB single-seat fighter and the A.W.XIV single-seat fighter, all fitted with the Armstrong Siddeley Jaguar engine and Townend cowling ring. The original intention was to show one of the latest Argosies, but at the last moment this machine was withdrawn as it was wanted by Imperial Airways for use on their Continental services.

Of the three machines shown the Atlas is one of the standard Army Co-operation types in use in the R.A.F. and the Siskin IIIB is a development of the type which forms the largest proportion of the fighter equipment of the R.A.F. The A.W.XIV is similar to the Siskin type but carries less equipment, with the result that its speed and climb are superior to the earlier type.

All these machines are of the well-known Armstrong Whitworth metal construction. The machines are covered with fabric but a plentiful display of test pieces and samples of their construction is shown. One of the main spars of the Atlas type is mounted so that a test load can be applied showing the deflection which can be obtained without any permanent set in the spar. A steel rib is shown under vibration test and a large case is filled with specimen ribs and spar sections. There are also uncovered Atlas ailerons and bottom planes.

A Short duralumin float for the Atlas completes this exhibit.

The Armstrong Whitworth Stand together with the Avro Stand is one of the largest in the Exhibition and the absence of the Argosy which would have absorbed quite an amount of this space makes an appreciable difference to its final appearance, for a better display of the other and newer types is now possible.

ARMSTRONG WHITWORTH DETAILS.—On the left a rib attachment and on the right a spar end fitting.

THE AVRO-FOKKER.—The Avro Ten, which is the British version of the Fokker F.VII-3m, is shown in public for the first time on the Avro-Armstrong stand.—(" *Aeroplane* " *photograph.*)

Digitized by Google

AVRO ANTELOPE DETAILS.—On the left two spar-end fittings and on the right the Avro patent high speed gun-mounting.

A. V. ROE AND CO., LTD., Newton Heath, Manchester. Stand No. 87.

A. V. Roe and Co. Ltd., which is now associated with Sir W. G. Armstrong Whitworth Aircraft Ltd. and is exhibiting on a joint stand with this company, show five aeroplanes. These are the Avro Ten three-engined eight-passenger monoplane; the Avro Five, three-engined four-passenger monoplane; The Avro Antelope General Purposes Type two-seater, and two Avians.

The Avro Ten is the British version of the Fokker F-VII 3m monoplane, the licence for the construction of which has been acquired by the Avro Company. This machine differs in no way from the well-known Dutch type except that certain minor constructional details have been either modified or embodied to meet with the requirements of the British Air Ministry. It has three Armstrong Siddeley Lynx engines mounted one in the nose and one on each side of the fuselage under the wings.

The Avro Five is a miniature version of the Avro Ten but has been designed entirely by A. V. Roe and Co., on the Fokker principle. It has three of the new 100 h.p. Armstrong Siddeley Genet-Major radial engines. The cabin seats four passengers in wicker chairs and is comfortably furnished. The pilot is in a separate cockpit in front of the cabin, the top of which is covered by a transparent cupola.

Behind the cabin is a fairly large luggage compartment with a further smaller one situated under the pilot's cockpit.

The two wing Genet engines are enclosed in completely streamlined eggs suspended below the wing and relatively in a much further forward position than is found on the Avro Ten.

The undercarriage is the wide divided type similar to that fitted to the Avro Ten, and the wheels have brakes.

The Avro Antelope is a two-seat General Purposes biplane with the Rolls-Royce "F" type engine. This machine is interesting in that it has a rectangular fuselage of duralumin channels with an outside covering of duralumin plates rivet- ted on. The fuselage is very narrow and under the nose i mounted a radiator which is cowled into the fuselage an fitted with shutters on the lines which were originated by th Curtiss Co. in their Hawk and Falcon military types.

The wings are of single-bay type and are of all-metal con struction, chiefly duralumin but with stainless-steel fitting

An alternative fuselage for the Antelope is also shown This is of the Fokker welded type and has four steel tub longerons and vertical and cross tube members of smalle diameter.

In the corners of the side, top and bottom bays are welde small steel quarter loops. Through these loops are threade the wire bracing which is tightened up with wire strainer

At first glance this gives the appearance of double bracin but actually it is single.

The two Avians shown are both of the new steel fuselag type but one has the Cirrus Hermes four-cylinder-in-line e gine and the other the Genet five-cylinder in-line radial wi Townend ring cowling.

These two machines provide an interesting comparison b tween two modern types of air-cooled engine cowling. T Hermes cowling completely surrounds the engine, the lin of which continue back into the fuselage. The Genet e gine is attached to the rounded-off nose of the fuselage a a Townend ring exaggerates the diameter of the engine u duly. From an æsthetic point of view there can be no dou as to which is the most attractive looking, whereas from t practical point of view there appears that there should little difference between the performance of the t machines.

The Hermes-engined Avian is the actual machine flown Mr. Stack in the King's Cup Race and is finished in blue a silver. It has what is known as the "sports type" und carriage, which is the original Vee cross-axle type fitted the original Avian. The Genet-engined machine is done black and silver and has the new divided type undercarria

A skeleton Avian fuselage is also shown. This is of welded round-tube (steel) type and is fitted with the n unit system of Avian controls.

Other examples of Avro metal construction are an ele tor and an engine mounting for the Avro Ten and a alumin skeleton wing for the Antelope and a table laid with a series of typical welded steel fuselage joints som which are sectioned to show the high quality of the weld

A Short metal float suitable for the Avian is laid across of the front corners of the Stand.

[The two Fokker-type machines, the Ten and the F strike one as being quite among the prettiest and most cient-looking machines in the Show. One gathers that price is a trifle high, but the superlative workmanship finish will certainly bring orders. Apart from them standardised Avians fully uphold the Avro reputation design and all-round quality.—C. G. G.].

AVRO AVIAN DETAILS.—Various fuselage fittings, including the main undercarriage leg fittings and a fibre control fairlead attachment.

AUTO-AUCTIONS, LTD. Burlington Gardens, Old B Street, W.1. Stand N

Auto-Auctions, Ltd., the well-known automobile de have acquired the sole World selling rights for the Black Bluebird side-by-side two-seat light aeroplane, and ar hibiting two identical machines of this type on their s one with the Cirrus III. and the other with the D.H. AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

BLACKBURN BLUEBIRD DETAILS.—On the left an aileron control lever and on the right an interplane strut fitting. In the middle is shown the method of attachment of the fuselage stringers.

metal Bluebird in which Sqn.-Ldr. L. H. Slatter, O.B.E., D.S.C., D.F.C., R.A.F., flew from England to South Africa early this year.

The Bluebird is well known as the only side-by-side two-seat light aeroplane in this country, and it has been fully described in previous issues of THE AEROPLANE. Actually it is the only all-metal light aeroplane at present in production, and the particular form of metal construction is simple and ingenious.

The wing spars are made up of two identical hollow "T" type steel sections, the stalks of which slide on one another and are automatically riveted down the centre-line. The ribs are built up of duralumin booms with diaphragms of the same material. The fuselage is in four sections, and with the exception of the main centre-section is built up of steel tubes assembled with flat steel plates. The centre section consists of two built-up duralumin frames and accommodates the pilot's cockpit. This unit also acts as the main anchorage for the wings, undercarriage, engine-mounting and the rear section of the fuselage. The fuselage is streamlined to an oval section above and below by formers, and on the sides by short members attached to the vertical fuselage members. At the extremities of these members and on the formers are either spherical balls or specially shaped tongues over which are sprung U-shaped duralumin stringers. These stringers are quickly removable.

As already mentioned, the cockpit seats two side-by-side, and complete dual control is fitted. The Bluebird control system is very cleverly designed, and throughout employs either tubes or straight cables. Separate seats are provided, either of which may be removed when necessary. A large luggage compartment capable of holding two average-sized suit-cases is situated behind the cockpit, and a further compartment in the top fuselage cowling above the luggage compartment will accommodate various long articles such as guns, fishing rods, golf-clubs, etc.

The under-carriage is of the divided type, and is quickly interchangeable with a twin float-base.

A skeleton Bluebird is shown on the Blackburn stand together with a set of floats. After examining the complete Bluebirds on the Auto-Auctions' stand, it is well worth while to make a point of visiting the Blackburn stand, if this has not already been done, to inspect the interior construction of the machine. Bluebird details are even seen on yet another stand in the show. S. E. Saunders Ltd. have taken over the production of this machine for the Blackburn Company, and on the Saunders stand is shown a board displaying a large number of small parts and stampings made by this company for the Bluebird.

THE BLACKBURN AEROPLANE AND MOTOR CO. LTD., Brough, Yorkshire. Stand No. 109.

The Blackburn Company are showing the hull of the Nile flying-boat, a Ripon, the new Lincock and the skeleton of a Bluebird. The Nile hull is the *pièce de résistance* of the stand, and, one might almost say, of the Exhibition, judging

BLACKBURN BLUEBIRD DETAILS.—One of the Bluebird metal floats with details of the various fittings

Digitized by Google

THE BLACKBURN LINCOCK.—The latest model of the Lincock with a geared Lynx engine and divided undercarriage.—(" *Aeroplane* " *photograph.*)

by the interest shown by important visitors, who have, in spite of the heat, lingered long within.

The hull is designed on the experience gained with the Iris, and is a very fine example of metal boat building. Actually the Nile will be a three-engined passenger monoplane. It certainly shows that Major Rennie is still as progressive as ever.

Access to the interior is through a hatch-way aft, and from the bottom of the companion-way a central gangway runs forward to the pilot's cockpit, and a nose cockpit for storing tackle and picking up moorings, etc.

The pilot's cockpit, or compartment as it should really be called, seats two side by side and is covered by a roof which projects above the top line of the hull.

The side and top windows of the roof are openable. Dual controls are fitted but are not complete on the hull shown as no wings, tail, or engines are fitted.

Behind the pilots' room is the main cabin for fourteen passengers. Passengers are seated in pairs facing each other on either side of a central gangway, except in the back seats on the right hand side which only accommodate tw facing each other.

The seats are deep and are fitted with pneumatic up holstery; and between each set of seats is a large table. Be hind each set of seats is room for hand baggage.

Ventilation and heating is controlled and each table provided with a bell-push communicating with the pantry.

Aft of the cabin is the lavatory and a position for the en gine-mechanic, and behind this is a pantry with an oil-cool ing-stove and a small kitchenette. Immediately behind th is the companion way and aft in the hull is room for heav baggage.

The whole hull is adequately lighted by ports and ro electric lights and has a spaciousness which is in stron contrast with that of the average air liner at present in u on Continental air lines.

The new Lincock is an extremely attractive little sing seat light fighter biplane,—much of that terribly secr French class, known as the " Type Jockey," produced to sho that a defensive fighter with a small petrol supply can

BLACKBURN LINCOCK DETAILS.—The new divided undercarriage of the Lincock.

Digitized by Google

THE BLACKBURN STAND.—A view showing the Ripon, the hull of the Nile and tail of the Lincock and the skeleton of the Bluebird. (" Aeroplane " photograph.)

with half the horse-power which most nations use for the job.

The modifications which include the fitting of a geared Lynx engine and a divided undercarriage greatly improve the appearance of the machine.

The geared-Lynx allows for an improved nose cowling and the new undercarriage has permitted further cleaning up in this locality.

It is now of all-metal construction, the wing being built up with spars of the Bluebird type.

The fuselage is a four-longeron steel tube structure, and is in three sections. These comprise the engine-mounting, the main central structure and the tail section.

The fuselage aft of the cockpit is faired to an oval section by formers, and quickly detachable duralumin stringers, and covered with fabric.

The cockpit is very roomy and arrangements are made for the installation of equipment such as is carried on standard fighters of double the horse-power of the Lynx, although owing to its size it is not possible to install all the equipment at one and the same time.

On a gross loaded weight of 2,000 lbs. the Lincock with a geared Lynx has a top speed of 154 m.p.h. and can carry all the necessary instruments, two guns, parachute and oxygen gear or if only one gun is fitted full electrical equipment or wireless apparatus may be substituted.

Provision is made for fitting the standard 215 h.p. ungeared Lynx IV, the 200 h.p. supercharged Lynx or the 250 h.p. Lynx-Major, in place of the geared Lynx, and the performance varies in consequence.

With the Lynx Major the Lincock has a top speed low down of 164 m.p.h. and with the supercharged Lynx it has a speed of 170 m.p.h. at 15,000 ft.

The Ripon shown is one of the standard service type two-seat torpedo-carriers with the Napier Lion Series XI engine. It has been designed as a general utility Fleet Air Arm type.

As shown it is arranged as a torpedo-carrier, and in this guise the Ripon achieves the remarkable performance of carrying a load of over 3,700 lbs. at a maximum speed of over 132.5 m.p.h. at sea level.

Unlike previous torpedo aircraft in use in the R.A.F. the Ripon has a second cockpit for an observer-gunner, which not only extends its utility for the alternative purposes of bombing and reconnaissance, but also makes the torpedo-carrying type capable of defending itself and dispenses with the need for a protective escort.

The aft cockpit is fitted with the new patent Fairey high-speed gun mounting. This mounting, apart from giving a large firing area, does not restrict the space in the back cockpit, is lighter than the older type, and when not in use is locked, with its gun, in a concealed position in the top fuselage fairing.

The wings are fitted with interconnected slots and ailerons.

The Bluebird skeleton fuselage is of the type that has been fully described in the past. This skeleton is shown in place of the Nautilus two-seat Fighter-Reconnaissance ship plane which at the last moment was withdrawn from exhibition owing to service requirements.

Other exhibits on the stand include specimens of metal construction, photographs and a model of the Nile flying-boat and one of the new 60-passenger 6-engined flying-boat which is now being developed. This latter boat is similar to the Nile in general arrangement and will have six Rolls-Royce H engines, the middle four engines being in pairs in tandem with two tractor engines, one on either side, all on the wings.

BOULTON AND PAUL LTD., Norwich. Stand No. 108.

The Boulton and Paul stand, although of comparatively small size, is full of meat, or perhaps one should say, of metal.

Raised above the stand is the main exhibit—the Sidestrand twin-engined medium-range bomber. In one corner is the Phœnix two-seat light monoplane and disposed round and between these two machines are a large number of specimens of B. and P. metal aircraft and airship construction.

The Sidestrand is shown half covered and half uncovered and is fitted with every form of equipment demanded by the Air Ministry. The construction of the Sidestrand is fairly well-known. The fuselage is a tubular structure, the main central section being of solid drawn tubes and the rear section of the patented B. and P. closed-joint drawn tube.

The nose section is now arranged to hinge to one side to allow for the easy insertion and extraction of equipment and for inspection.

Three gun positions are provided, one in the nose and two behind the wings, one above and one below the fuselage.

The bottom rear gun position has a special gun-mounting, which, owing to the shape of the bottom forward fairing of

The Boulton and Paul bottom rear gun mounting from the gunner's seat, looking aft under the fuselage.

Digitized by Google

THE BOULTON AND PAUL STAND.—A view from the Gallery showing the partly uncovered Sidestrand and on the right a portion of a section of the framework of R.101. —(*"Aeroplane" photograph.*)

the fuselage is brought fairly low and below the rear longerons and provides an extensive field of fire aft, but it must decrease the speed of the machine.

Under the centre-section of the wings is stowed the bomb load. Within the bottom fuselage fairing, out of the air flow, but not enclosed, are racks for four 112 lb. bombs, and on either side under the centre-section roots are carried two 230 lb. bombs.

The engines are two 480 h.p. geared Bristol Jupiters. They are mounted on swinging engine-mountings to give access to the rear of the engines.

The rear cockpit is very completely furnished with wireless, guns and the usual military impedimenta. The new Irving observer's parachute pack, which is not worn until an actual emergency occurs, is stowed in a compartment on the right side of the cockpit.

The tail control surfaces have ordinary horn balances and a servo rudder control in place of the earlier shielded horn balances.

The Phœnix two-seat light aeroplane is a small braced parasol monoplane with the 40 h.p. A.B.C. Scorpion engine. One feels that in this design bare utility has completely overruled any considerations of appearance or efficiency. It may be argued that this is a minor point so long as it flies, which it is said to do quite well, but the modern aircraft owner is becoming more particular about appearance in the same way that the car owner has in the past.

However, the machine shown is only a wooden experimental model for the production metal type, and several alterations will be embodied in the subsequent type.

The main undercarriage legs will be taken to the front centre-section fittings on the wing instead of to the top

(*Continued on p.* 243.)

SIDESTRAND DETAILS.—On the left an undercarriage leg and on the right details of the wing and aileron construction. Inset is a section of the new closed tube spar for light aircraft.

ENGINES AT OLYMPIA.

THE CIRRUS AND A.D.C. ENGINE STANDS.—These are alongside each other. On the former are shown the Cirrus and Cirrus-Hermes engines and on the latter the Nimbus and Airsix engines.
("Aeroplane" photograph.)

A.B.C. MOTORS LTD., Walton-on-Thames, Surrey. Stand No. 14.

Both types of aero-engines produced by A.B.C. Motors are shown on their stand together with a number of parts illustrating the detail design.

The lighter of the two engines is the A.B.C. Scorpion which is a horizontally-opposed air-cooled cylinder engine of 35/40 h.p. Owing to the increased interest shown in really light aeroplanes abroad these engines are being used all over the world. A number of new types for the owner pilot have recently been produced in this country which incorporate this engine. These are the A.B.C. Robin, the Glenny and Henderson Gadfly, the Comper Swift and the two-seat Boulton and Paul Phoenix.

The performance of the Scorpion has been improved by the fitting of a new carburettor which makes for smoother running.

The A.B.C. Hornet is virtually a double Scorpion and develops 80 h.p., so that it competes with the popular in-line air-cooled engines of roughly the same power. As the engine has two cylinders arranged in pairs on each side, when fitted in an aeroplane there is a very clean line to the top of the fuselage. This makes the engine an attractive proposition for use with the cabin monoplane type.

Originally the Hornet had four long bolts passing through the crankcase which were used for mounting. The latest improvement is the fitting of four tubes for the same purpose. These tubes finish in flanges which will pick up fittings on the main fuselage structure, thus considerably facilitating the work of the aircraft designer.

A number of parts in both engines are interchangeable. They both resemble each other in having a similar type of push-rod and rocker-operated valve gear, together with a dry sump lubrication system, and the employment of dual ignition from a twin-spark magneto.

A.D.C. AIRCRAFT LTD., Regent House, Kingsway, London, W.C.2. Stand No. 96.

A.D.C. Aircraft Ltd. are showing two engines which bear a very strong resemblance to each other and one can safely say that the air-cooled one was developed from the water-cooled one.

The latter is the 6-cylinder-in-line 300/330 h.p. Nimbus and is well known as an efficient successor to the war-time Puma. The former is the Airsix and is similar in many respects to the Nimbus, but is air-cooled.

The six large cylinders are set in one line and are relatively tall in comparison with the rather shallow crankcase, and have fins right down almost to the base.

The valve springs are sunk low in the deeply-ribbed head and the valves are operated with an overhead camshaft. In the Airsix the two carburettors are arranged one at each end of the cylinder block, thus decreasing the width of the engine as compared with the Nimbus, where the carburettors are at the side.

The two magnetos are, in both engines, across the rear end.

The Airsix is shown in two models—one cowled and one uncowled. The cowling is very neat indeed, and separate air chutes have been arranged for each cylinder, but though it might do for the engines under the wings of a multi-engined aircraft, it looks distinctly the work of an engineman and not an aircraft designer if it is meant to be applicable to the engine of a single-engined machine.

One has not heard of it being flown as yet, but, if successful, it should fill a definite want for the higher-powered class in air-cooled engines which at present is only catered for by the radial type.

ARMSTRONG SIDDELEY MOTORS LTD., Coventry. Stand No. 86.

This stand shows a range of the engines made by Armstrong Siddeley Motors Ltd. A Jaguar 460/500 h.p. engine is mounted on a frame so that it can be shown running. It is driven by an electric motor, and has several of the most important parts sectioned so that one is able to see all the parts actually working.

The other engines shown are the Leopard 700/805 h.p. 14-cylinder, the geared Jaguar 480/510 h.p. 14-cylinder, the Lynx 225/235 h.p. 7-cylinder, the Genet Major 103/110 h.p. 5-cylinder, the standard Genet 80 h.p. 5-cylinder, and the Mongoose 155/165 h.p. 5-cylinder.

All Armstrong Siddeley engines are of the static radial type. A point which speaks well for the makers is that all the engines shown are finished in the standard way and have no special show finish at all.

The engines are well shown on raised stands, which makes seeing them an easy matter. A box at the base of each engine is filled with leaflets in four languages,—so that foreign visitors are kept well informed.

A table in the middle has a display of different parts of the engines. This brings out the fact that many of the parts are interchangeable among the various engines.

THE BRISTOL AEROPLANE CO., LTD. Filton, Bristol. Stand No. 103.

The Aero-engine Department of the Bristol company are showing four radial air-cooled engines. These are the Mercury, Series III.A., the 515-550 h.p. Jupiter, Series IX.F., the 290-315 h.p. Neptune, Series I., and the 205-225 h.p. Titan, Series II., engines.

The Mercury engine is still on the Air Ministry Secret List, therefore little can be said about it. In general arrangement it is similar to the Jupiter engine. It is a nine-cylinder radial with a bore and stroke of 5.75in. by 7.5in. Unlike the Jupiter, the overhead-valve gear is enclosed in one large flat cover instead of two separate covers, and the push-rods are also enclosed.

Digitized by Google

The Jupiter Series IX.F. engine has the new Bristol open-ended cylinders, with separate forged cylinder-heads of "Y" alloy. The cylinder barrel is a carbon-steel forging with integral fins. The cylinder head is screwed on, and in order to ensure a gas-tight joint, the engaging threads are machined with an interference fit. Before screwing on to the barrel, the head is heated to above working temperature, and after it is screwed on a steel band is shrunk over the joint. Four valves, two inlet and two exhaust, are fitted per cylinder, the inlet ports being at the back and the exhaust ports at the front of the head.

The induction system of the unsupercharged engines incorporates the Bristol patent spiral distributor, and in the F engines—that is, those fitted with the new type cylinders—six deflectors in place of the three fitted to the earlier type are used. This new arrangement reduces the spiral passage traversed by the mixture by approximately 25 per cent.

The induction elbow is exhaust-heated and a bye-pass valve permits the heating effect to be varied from a minimum to a maximum to suit operating conditions.

The engine shown is fitted with a Farman type 2 : 1 reduction gear, and in the F series engines this has a stiffer airscrew shaft and a large front bearing.

The Neptune and Titan engines are smaller versions of the Jupiter, and incorporate Jupiter F type cylinders and various other components. The former has seven cylinders and the latter five. There are seven versions of the Jupiter, including direct drive, geared and supercharged types, the first two with three different compression ratios.

These seven engines, together with the two smaller engines, provide a complete range of air-cooled radial engines with horse-powers ranging from 200 to 550. And this does not take into consideration the Mercury, which is still a semi-secret service engine giving a considerably higher horse-power than the Jupiter. The Bristol company have thus a range of engines, all based on the well-tried and world-famous Jupiter for the military and civil requirements of almost any nation.

To dilate on the merits of the Jupiter would be a sheer waste of time and space. Not only is it being used in almost every country boasting of an air service of any size, but it is also being built under licence in nine different countries. With such a popularity it is perfectly obvious that to anyone who is remotely interested in aero-engines, the claims and the performance of Bristol engines in general and of the Jupiter engine in particular are well known.

There is also shown on the stand a model of the latest Bristol Triplex carburetter with pump accelerating device and automatic boost control, an assortment of Jupiter components both rough and finished, and a Bristol Gas-Starter.

CIRRUS AERO-ENGINES LTD., Regent House, 89, Kingsway, London, W.C.2. Stand No. 99.

The Cirrus Engine stand is in the middle of the Main Hall.

Two examples of the new Cirrus-Hermes and one Cirrus Mark III are exhibited.

The Hermes has been developed in answer to the demand for an engine of somewhat greater power than the Cirrus III and has been designed as far as possible on motor-car lines so that the private owner will have no difficulty in maintaining his engine in perfect running order without the necessity of going to a skilled mechanic.

On one of the two models a Heywood starter and a patent fuel pump have been fitted to show how these accessories may conveniently be used without greatly increasing the overall dimensions of the engine.

The air intake has been redesigned, bringing the carburettor closer to the cylinders than in the Cirrus III and thus decreasing the width of the engine at the top.

On the Cirrus III is to be seen one of the M.P.L. steel airscrews, in which the blades are adjustable.

Both engines are of the 4-in-line air-cooled type. The Hermes is 105/116 h.p. and the Cirrus III 85/95 h.p. They were fully described in the special Show Guide issue of The Aeroplane. The Cirrus, anyhow, is now in such common use in light and medium-sized aeroplanes in almost all countries that descriptions should hardly be necessary.

The Hermes in an Avro Avian, as all the World knows, came very near to winning the King's Cup Race for Mr. T. N. Stack on its first public appearance, and but for the unforeseen trouble caused by a defective piston casting would have undoubtedly done so.

The makers have shown their confidence in the engine by making the trouble public instead of leaving people to guess about it and to be deceived by rumours.

THE DE HAVILLAND AIRCRAFT CO. LTD., Stag Lane Aerodrome, Edgware. Stand No. 15.

The De Havilland engine stand is a very small corner section of the aeroplane stand and thereon are shown two Gipsy engines. One of them is sectioned to show all working parts, the various components and "innards" being painted in distinctive colours to make inspection easy.

The other engine is a standard service Gipsy and is actually the sealed engine which has been flying continuously in a Moth for over 500 hours. It is shown just as it was taken out of the machine, except for a wash down.

A large card announces the latest score for the engine, and red ribbons, attached to the sealed points, all converge at a large red seal in the middle of the card.—A clever piece of showmanship.

THE BRISTOL STAND.—The two most prominent engines in this photograph are the new Jupiter XIF and the Mercury IIIA, the former on the right and the latter on the left.—(*"Aeroplane" photograph.*)

Digitized by Google

This engine has now been flown for 502.3 hours, which represents a distance of 42,695 miles. The average petrol consumption over this distance was 19½ miles per gal. The oil consumption was 1,400 miles to the gallon. The tests will be continued after the Exhibition.

An additional announcement card at the back of the stand gives further information about the Gipsy engine, particularly with regard to its extended use all over the World. This card announces that the weekly production is 25 engines, which must represent the biggest production output of British aero-engines since the war.

The engine itself is too well-known to need description here. It has been twice described in THE AEROPLANE, the last occasion being in the special Show Guide published on July 12, 1929.

H. and M. FARMAN, Billancourt (Seine). **Stand No. 89.**

A 9-cylinder air-cooled radial 280 h.p. type 9EA geared engine, and the 18-cylinder inverted, water-cooled, supercharged 650 h.p. engine, are the two engine exhibits, and well show the diversity of types made by this firm.

FIAT (ENGLAND) LTD., 43-44, Albemarle Street, London, W.1. **Stand No. 91.**

Two models of the well-known Fiat water-cooled engines are shown on this stand. The first is the A.22, 620 h.p., and the second the A.25, 1,000 h.p.

There is a distinct family resemblance between the two engines. Both are clean, and the larger one differs only in minor details, such as having three carburettors and also four sparking plugs per cylinder. Both are direct-drive and not supercharged.

The A.22 is the same as was used by the well-known Italian pilots Ferrarin and del Prete in their flight from Rome to Brazil in a Savoia monoplane.

AUTOMOBILES HISPANO-SUIZA (GT. BRITAIN) LTD., 71, Carlton House, Regent Street, S.W.1. Stand No. 65.

The Hispano-Suiza stand is close to that of the Italian Air Ministry at the front end of the annexe. On the stand are examples of the familiar Hispano-Suiza types developed from the famous wartime models. Of especial interest are two samples of their latest design, one of these is a 12-cylinder Vee type developing 500 h.p. suitable for high-performance military aircraft and an in-line 6-cylinder engine giving 100 h.p. suitable for light aircraft. All the exhibited Hispano-Suiza engines are water-cooled.

The latest types incorporate some interesting features. In the early engines the steel cylinders were individually bolted to the crankcase, their upper ends being screwed into the aluminium water-jacket casting. In the latest types the cylinders are made from a special steel and afterwards treated with nitrogen, which results in a glass-hard surface. These steel cylinders are then screwed into a monobloc casting which is bolted direct to the crankcase. By this design it has been possible to increase the diameter of each cylinder by 10 mm. without increasing the overall dimensions of the engine. Apropos of the aforementioned nitrogen treatment there is on the stand a demonstration cylinder so treated, which visitors are invited to scratch with a file, whose efficiency they are first asked to test on ordinary mild steel.

All Hispano-Suiza engines are very clean in appearance, especially the 6-cylinder-in-line 100 h.p. engine.

The 12-cylinder Vee engine of a nominal 500 h.p., which, however, develops a maximum output of 750 h.p., has the remarkably low power-weight ratio of under 1½ lbs. per h.p.

A detail improvement is the fitting of a special bye-pass arrangement in the lubrication system so that on starting oil may be immediately supplied to the big ends, whence it is splashed over the cylinder walls. By this means the necessity for slow running up to warm the oil is obviated, and in an emergency a start may be made in 16 secs.

FABRICA AUTOMOBILI ISOTTA FRASCHINI, 89, via Monterosa, Milan, Italy. **Stand No. 98.**

Three "Asso" engines are shown on this stand, the 1,200 h.p. 18-cylinder broad arrow water-cooled geared engine, the "Asso Caccia" 420 h.p. 12-cylinder Vee, direct drive, air-cooled engine, and the "Asso 500" 12-cylinder Vee, direct drive, water-cooled engine.

This stand cannot fail to attract a crowd owing to its "flower-garden" layout. In fact, the people in charge have had difficulty in defending the flowers against being picked.

The 1,200 h.p. engine is mounted on a stand about 9 ft. high and has a large four-bladed airscrew. The pedestal is completely surrounded with flowers and "grass," and the whole is surmounted by an ornate archway, which makes an exhibit that certainly forced one to look at it.

The firm makes engines from 80 h.p. to 1,200 h.p., with and without reduction gear, and is amongst the first to make extensive use of magnesium alloy castings, as they have their own foundry for this purpose.

BRITISH MERCEDES-BENZ LTD., 37, Davies Street, Grosvenor Square, London, W.1. **Stand No. 97.**

The engines shown on this stand might almost be called the Alpha and Omega, for the two exhibits are about as far apart as it is possible to be in every way. The smaller is the 20 h.p. 2-cylinder type F.7502 and the larger the 800/1,000 h.p. 12-cylinder type F.2.

The F.7502 is chiefly known in this country in connection with the Klemm light aeroplane. It is horizontally-opposed flat twin and the airscrew is driven through a planetary gear with a ratio of 3:1 and is air-cooled.

The larger is a Vee type water-cooled engine of massive construction and has a compressor in the induction system and a spur-wheel reduction gear to the airscrew shaft.

Externally this engine is clean and accessible but gives one the impression of unnecessary bulk. In actual weight it is, however, not over-heavy, being 1,800 lbs. with the compressor.

D. NAPIER AND SON LTD., Acton. **Stand No. 100.**

Napier engines, holding as they do so many records and having done so many world-wide long-distance flights,

THE NAPIER STAND.—The three engines seen in the photograph are, from left to right: the Series VIIB racing engine, the Series IX standard service type engine and the one in the glass case, on the right, the sectioned Series V engine.

Digitized by Google

should not need any introduction, and detailed descriptions have already been given in previous issues.

The Napier stand is in the middle of the main hall and in comparison with its flower-bedecked foreign competitors is distinctly austere in yellow and gold. The engine exhibits are relieved by a selection of pictures showing well-known aircraft with Napier engines, most of which are well known to the general public.

Four engines are shown on this stand. Two are Series XI engines as used in the Fairey monoplane (exhibited in the Show) which flew non-stop from England to India. These are widely used in the R.A.F. to-day in all classes of aircraft.

The Series VIIB, the racing model of the same engine, gives 875 h.p. at 3,300 r.p.m. This engine, with a weight of 1.063 lbs. per h.p., must be the lightest water-cooled engine in the world.

Engines of this type were used in the last Schneider Trophy Contest at Venice, in the machine which gained the fastest speed in the air, namely 319.57 m.p.h., the car which holds the World's Land Speed Record, the boat which won the World's Motor-boat Speed Championship, and the car which broke the World's Land Speed Record over 5 miles and 5 kilometres.

This engine differs from the Series XI in that the magnetos are put in the front, the gearing is neater, the carburettors are closer to the engine and the cylinder-head casings are neater. And, naturally, the compression-ratio and tuning generally are suitable for this type of work.

The remaining engine is the Series V, a type that was used on the Far East cruise of the four Supermarine "Southampton" flying-boats and also the 1926 and 1927 Cairo to Cape Town flights with four Fairey IIIF aircraft.

The Vickers Victorias which recently evacuated the foreign inhabitants of Kabul were fitted with this engine. The model shown is show-finished and sectioned and is displayed in a glass case driven by an electric motor so that all moving parts may be seen at work.

In this model the carburettors are placed in front of the engine and it is slower running than the other models, but the other differences are not visible to the eye of the layman.

GEORGE PARNALL AND CO., Yate, Bristol.
Stand No. 93.

Alongside the Parnall Aeroplane Stand is a small island occupied by the Pobjoy engine, which is shown attached to a light tube mounting. This engine, which was designed by Mr. D. R. Pobjoy, is being assembled by George Parnall and Co., hence their presence as an aero-engine exhibitor. There is also a cabinet containing the major parts, such as connecting-rod assembly, crankshaft and gears.

The Pobjoy engine seems to be the ideal engine for the light aeroplane. It has low weight—including the mounting plate it weighs under 2 lbs. per h.p.—there are seven cylinders making for extremely easy hand starting, and the engine turns round at 3,000 r.p.m., making it delightful to fly behind. As the engine is geared a very much larger airscrew can be used. The gearing is so arranged that the thrust line of the airscrew is above the centre line of the crankshaft. This permits the use of a larger airscrew without lessening the normal ground clearance.

Tests with a light aeroplane which had previously been fitted with a heavier and more powerful engine showed greatly improved performance when fitted with the Pobjoy engine. This is really interesting, as the trend at the moment is to fit higher and higher powered engines; yet here is a way out,—a small smoothly running engine with a geared airscrew and low weight per h.p.

Another particular feature of the engine is the fitting of hand starting gear. The number of cylinders and their small individual volume make it easy to turn the engine over by means of a simple quadrant and ratchet device to which a cord pulled from the cockpit is attached.

The engine has already been described in THE AEROPLANE but its essential features are as follows. It is a seven-cylinder air-cooled radial with reduction gear. The cylinders are of steel and are screwed into aluminium heads. Dual ignition is fitted. The Zenith carburetter feeds to the centre of a spider of induction pipes through which the gas is distributed to each cylinder. The airscrew is driven by a double helical spur gear with 1.91 to 1 reduction.

A flywheel steadies the torque on these gears and at the same time is used as a centrifugal filter for the oil, any dirt being deposited inside the wheel whence it may be removed by detaching a cover.

The whole engine is mounted on a simple plate pressed from stainless steel which also serves as a duct for the ignition wires.

THE REDRUP LEVER ENGINE SYNDICATE. 4, Broad Street Place, E.C.4. Stand No. 12.

The Redrup Lever Engine Syndicate is showing in public for the first time the Redrup "Fury Mk. II.," axial air-cooled lever engine, suitable for light aircraft. On the stand is shown a sectioned engine which is being operated by an electric motor to demonstrate its action, and two empty "power-eggs," one designed for a Redrup Fury engine and one suitable for a standard radial air-cooled engine of similar power, the relative sizes of which are adequately shown.

The Fury is a 90-95 h.p. engine with seven cylinders lying parallel to and around the crankshaft. The crankshaft is of a flattened "Z" type, and carries on ball bearings on the middle leg of the "Z" a seven-pointed star member. The seven ends of the star member are opposite the seven cylinders, and are connected to the pistons by connecting rods through universal joints at the star end and gudgeon pins at the piston end. The star member is prevented from rotating by a stabilising fork or gimbal hinged at the centre of oscillation and held at a point of the crankcase where the full torque reaction of the engine is taken.

A single carburetter is mounted below the engine, and feeds to a central chamber, and thence by radial passages cast in the crankcase to the inlet valves. The valves are operated radially by a campack on the crankshaft, the inlet and exhaust ports being on the outsides of the cylinders and disposed radially round the engine.

Two B.T.H. magnetos fire two plugs per cylinder.

The Fury is designed to develop 85 h.p. at 2,000 r.p.m., with a maximum output of 95 h.p. at 2,250 r.p.m. The cylinders are 3 7/16in. by 4 5/8in. bore and stroke, and the weight is 220lb., which gives a weight-power ratio of 2.61lb. per h.p. The overall diameter of the engine is 18¼in., and the length is 37in.

The engine has already flown in a Simmonds Spartan, and an example is being prepared for the Air Ministry Type Test.

THE REDRUP LEVER ENGINE STAND.—In the centre is the sectioned engine and on the left and right respectively are cowlings suitable for the Redrup Fury axial engine and a radial engine of equivalent power.
("Aeroplane" photograph.)

Digitized by Google

THE ROLLS-ROYCE STAND.—On this stand are shown various specimens of the "F" and "H" type engines and in the middle of the stand may be seen the "F" type engine in the standard cowling of the Hawker Hart day bomber.

The Fury has considerably less head resistance than any radial engine of equivalent power. An engine of this size (18½in. diameter), however, should best be able to demonstrate its real merits when installed on the wings of a multi-engined machine which has engines either in streamlined nacelles or mounted direct in the wing. The size of the nacelle cowling shown on the stand as suitable for this engine amply demonstrates this.

In larger sizes, developing correspondingly greater horsepower, the engine opens up an entirely new field for itself. For high performance military aircraft an engine which combines a small frontal area with the simplicity and low frictional losses of the Redrup Lever engine is very desirable. At any rate, Mr. M. L. Bramson claims that the firm is the first to have solved the problem of "closing the sunflower."

ROLLS-ROYCE LTD., 14/15, Conduit Street, London, W.1, and Derby. Stand No. 102.

Two types of engine are shown on this stand, the H and F.

The H type is normally rated at 830 h.p. and the F type at 400 h.p.

The former is shown in its standard condition with gearing to the airscrew shaft and a moderate supercharger in the induction system. The latter is shown with and without supercharger, and also on a mounting similar to that used in the Hawker Hart and fitted with a complete set of cowling.

The F type is now well known as a 12-cylinder Vee, water-cooled engine and has been thoroughly described in the Show Guide issue of THE AEROPLANE.

The H type follows the F in general design, but the bore and stroke have been increased and the supercharger is fitted as standard.

Compared with the old familiar Falcon, Eagle and Condor engines the F and H types are remarkable for their cleanliness of outline. No engine in the World gave more faithful service in the War 1914-18 and since than did the Rolls-Royces, but their multiplicity of external parts scared some people. The new types are not surpassed by any engine in the World for external simplicity and internal goodness.

STATAX-MOTOR A.G. Zurich, Switzerland. Stand No. 63.

The only rotary engine at Olympia is the 40 h.p. 7-cylinder Statax. It is of an unfamiliar type, and was, one believes, designed before the war. It has recently been resurrected by the Statax-Motor A.G., of Zurich, Switzerland, who exhibited this engine at Berlin last year, at Geneva this year and now show it at Olympia.

The Statax engine has its seven cylinders arranged parallel to and circumscribing the axis of rotation. The connecting rods are ball-ended and carried by a so-called stroke-ring which rotates in an inclined plane about a fixed shaft in the axis of rotation. All the cylinders and the stroke-ring revolve about the fixed shaft, and as the stroke ring revolves in an inclined plane the pistons travel in and out. The connecting rods are slightly inclined to give initial motion. The fuel is fed into the hollow fixed shaft and passes thence by annular slats to the cylinders. The valve gear consists of a single sleeve per cylinder which opens and closes the inlet ports in the fixed shaft and the exhaust ports. These latter are in the outer cylinder walls and exhaust straight into the atmosphere.

The main features claimed for this engine are its low frontal area and good cooling. The overall diameter is 16½ in.

One was told on the stand that the Statax company hope to be able to demonstrate one of their engines fitted in a German light aeroplane in this country before the end of the Aero Show.

THE SUNBEAM MOTOR-CAR CO. LTD., Moorfield Works, Wolverhampton. Stand No. 101.

Two engines are shown on the Sunbeam stand, one an internal combustion engine of 1,000 h.p., and the other a compression-ignition engine of 104/112 h.p.

The 1,000 h.p. is designed by Mr. Coatalen and is probably the largest engine in the show.

It is a 12-cylinder Vee type, geared, water-cooled. So far as one can understand, it is still in the experimental stage and is likely to remain so. The model shown is the property of the Air Ministry, and consequently details are not given to any extent.

The smaller engine is a six-cylinder, vertical, water-cooled, compression-ignition engine. Many of the difficulties of this type have been overcome, but, as with the former engine, it is still only experimental, and with its present weight can hardly be a feasible proposition for aeroplane use.

With a B.M.E.P. of 102, and weighing 4.35 lbs. per h.p., it has obviously a long way to go yet. Solid injection is used at a pressure of 10,000 lbs. per sq. in., and good atomisation is got by injecting direct onto the apex of the conically-shaped piston.

Excellent results have been obtained with one and two-cylinder test engines of this type and the Sunbeam Co. deserves every credit for the development work they have, and are doing with this type. It is to be hoped that we shall shortly see a flyable engine marketed by them.

J. WALTER AND CO., Prague XVII-Jinonice, Czechoslovakia. Stand No. 94.

The engines shown by the firm of J. Walter and Co. are the Vega 85 h.p. 5-cylinder, the Venus 110 h.p. 7-cylinder, the Mars 145 h.p. 9-cylinder, and the Castor 250 h.p. 7-cylinder.

These engines are all of the static radial, air-cooled type and are thoroughly up to date in all respects. The firm has a large factory in Czechoslovakia at Prague and is exporting their engines to all parts of the world.

Large numbers of International Air Records have been gained with Walter engines, amongst which may be mentioned the closed circuit for both single and two-seater light aircraft, and the great flight of Major Vicherek from Prague to Bednyl Dimyanovsk, near Spask in Russia, a distance of 1,245 miles.

These engines are robustly built and simple, and the chief aim of the firm has been to produce an engine which will run for a long time in amateur hands without needing overhauling, and from the results they have obtained in tests they would seem to have succeeded.

A show stand in the middle shows photographs of aircraft of various types fitted with Walter engines.

FOREIGN COMPOSITE EXHIBITS.

THE COLLECTIVE EXHIBIT OF THE GERMAN AIRCRAFT INDUSTRY.

Along the north side of the Annexe, and behind the Simmonds and Dessoutter stands, are the German exhibits.

The first to which one comes, walking along by the wall, is a two-seat machine resembling the Hill Pterodactyl. This machine has two seats in tandem, with a Bristol Cherub engine at the back driving a pusher air-screw. The wings, which are covered in three-ply, are swept back, but without being tapered. Along the trailing edge are flaps, two on either side. One was given to understand that the outermost pair take the place of the normal elevators, while the inside ones are used as ailerons.

The place of the rudder is taken by spoiler-plates which can be extended above and below the leading edge of the wing just before the front spar. This machine is made by Soldenhoff-Langguth and Friedman of Berlin.

Next to this comes the stand of the Argus Motoren-Gesellschaft, which is probably the oldest aircraft engine factory in Germany. They built quantities of six-cylinder engines during the War 1914-1918. Recently the firm has designed a new four-cylinder in-line inverted air-cooled engine of 80 h.p. and it is this engine which is shown on the stand.

Two 80 h.p. engines are mounted back to back on an inverted pyramid of steel tube. These engines are particularly clean and are beautifully finished. And it is easy to see what a good streamline may be obtained by fitting an engine of this type, especially in cabin monoplanes.

While on the stand one was shown a photo of the new high-wing cabin monoplane recently built by the Arado firm, which is equipped with this engine. The forward view from the cabin is remarkable. There are no projections.

The Argus engine has an electron crankcase, steel cylinders and light alloy heads; the oil is carried in a separate compartment in the crankcase above the crankshaft. Two magnetos are above the front bearing of the crankshaft.

There are two scavenger pumps and one pressure pump. Each cylinder has one exhaust and one inlet valve operated by push-rods.

Next door is the stand of the Haw Propellerbau. Above this stand is a three-bladed airscrew rotated by an electric motor. This is fitted with variable pitch mechanism which can be operated from the foot of the stand. Round the stand are more airscrews of various shapes and sizes illustrating the Haw type of construction.

The particular feature of these airscrews is that the blades are cast in a light alloy, but all the loads are taken by a system of steel rods inserted from the inner end of the blade and screwed into place. These blades are then placed in a two, three, or four-armed boss and locked in position at the required pitch.

For the variable pitch airscrews a similar type of construction is used, but the mechanism used for turning the blades is neither illustrated nor described.

These blades have been tested under flying conditions with a piece cut out of the outer blades. No damage resulted from this test as the interior system of steel rods took all the various forces.

This Company also makes brake airscrews for testing engines and fans for ventilation purposes and the like.

Lastly on this side one comes to a stand showing models and photographs of the various German aerodromes. Amongst these are some very attractive photographs of the town of Dortmund. The following aerodromes are represented on the stand besides Dortmund:—Lubeck-Travemünde, Cologne, Halle-Leipzig, and Hamburg.

Immediately across the gangway is the Rohrbach stand with a big model of the Romar. This model, unlike the actual Romar, which has three B.M.W. engines with a total horse-power of 2,000, has four Jupiter engines arranged tandem fashion, that is to say, it has two nacelles, each with one tractor and one pusher airscrew. The model has also a kind of N.A.C.A. cowling.

The whole side of the model is cut away so that the interior equipment may be studied. The curious double curves of the planing bottom are quite unlike anything in this country. The stand is also illustrated with flying pictures of the Romar, the Rostra and the Roland.

The next exhibit is the B.F.W. M.23 low-wing two-seat monoplane,—very like a Klemm. This machine has a five-cylinder radial air-cooled Siemens engine of 68/82 h.p., but the Genet, Cirrus, or Hermes can also be fitted.

Besides this machine the B.F.W. stand contains charts showing the comparative performances and so on of the firm's other aeroplanes and many photographs of them.

The M.23 has cantilever wings built on the well-known Messerschmitt monospar construction. The wing is covered with three-ply except for the wing tips and the trailing edge. The fuselage is built of wood with three-ply covering. The tail unit is of wood with fabric covering.

The undercarriage is of the divided type with very simple elastic loop springing.

The wings are arranged to fold back. This is done by removing three bolts at each side of the fuselage, turning the trailing edge of the wing upwards and then folding it back against the fuselage.

The biggest of the German exhibits is the Heinkel E.9, which is a three-seat twin-float seaplane with a B.M.W. VI 500 h.p. engine.

This machine is a low-wing monoplane with a welded steel tube fuselage and wooden wings. The fuselage is covered from the nose to behind the aftermost cockpit with light metal. The remainder is covered with fabric.

The steel-tube engine-mounting is detachable. The tail unit is of steel tube with fabric covering. The tail-plane is adjustable in the air, but the fin can only be adjusted from the ground.

The wings have two spars of the box type and are strengthened along the leading edges with plywood. The entire wings are covered with fabric.

A fuel tank is carried between the spars of each wing close to the fuselage, whence the petrol is pumped to a gravity tank in the fuselage, just above the engine.

The floats are rather crude compared with the all-metal types made here. They have a single step and are made of wood. Each is divided into seven watertight compartments.

THE JUNKERS EXHIBIT.—The Junkers Junior Light Monoplane with the Armstrong-Siddeley Genet engine.

Digitized by Google

An example of German thoroughness and willingness to learn from experience is shown by the provision on the underside of the floats of handrails, and the building in of a small compartment which can be opened from either the top or underside of the float.

During the seaplane trials organised by the German Government, when a Heinkel machine won first prize, another machhine crashed and turned over in the water. As the emergency rations were in the machine and not in the float, the pilot was killed, and that is why special provision is made to prevent the recurrence of a similar tragedy.

The float undercarriage is made to form part of the wing-bracing structure.

The whole machine strikes one as being particularly suitable for its job, which is the training of pilots.

Next comes the Junkers' stand, where there is a model of an aeroplane hangar built by the Junkers' special method of steel Lamella construction, which allows the big span required for the housing of aircraft.

Inside are a number of models of well-known Junkers' types. There are also a number of Junkers' pumps.

But the chief attraction of this stand is a new light aeroplane, known as the Junior. This machine has the general Junkers' characteristics. It is a cantilever low-wing monoplane. The metal covering of the wings, fuselage and tail-unit is of the familiar corrugated type.

The wing, built in the usual Junkers' fashion, is in three portions, the two outer panels being attached to the centre section on which the fuselage rests.

The narrow chord ailerons extend the full length of the outer panels.

The cockpits are roomy and nicely equipped with a full range of instruments, including a fire extinguisher.

The undercarriage consists of two steel V's hinged to the bottom of the fuselage, and two vertical shock-absorbers to the lower plane.

The machine has extremely clean lines and looks very neat. This, coupled with the fact that no rigging is required, and that there are no easily damaged fabric-covered flying surfaces, and that a machine with a Genet engine has a top speed of 109 m.p.h. makes it very attractive.

The price complete with Armstrong Siddeley Genet engine, C. of A. and registration is £795.

Coming round the corner one arrives at the Dornier stand where, against a background of polished wood hung with pictures, is a model in metal of the Do.x with a removable roof so that the interior may be studied.

As everybody knows, this machine has twelve Siemens-Jupiter engines arranged in pairs, tandem fashion, over the leading-edge driving six tractor and six pusher airscrews.

A small runway in the wing allows a mechanic to reach any of the engine while the machine is in the air. The wings are braced by three outwardly sloping struts on each side to the sponsons which give the boat its lateral stability on the water. Examination of the model emphasises the sensibleness of the design.

There is also a model of the Do.S with four Jupiter engines. And there is a model of a racing 'plane with two engines of 1,000 h.p. The latter consists of a low-wing monoplane with two floats continued upwards at their aft end to form the tail, the fuselage being replaced by two engines in tandem, one driving a tractor and one a pusher airscrew with the pilot placed between them.

THE COLLECTIVE EXHIBIT OF THE FRENCH AIRCRAFT INDUSTRY.

Immediately behind the Italian stand, in the Annexe, is the stand organised by the *Chambre Syndicale des Industries Aéronautiques.*

The first machine one notices is a Lioré et Olivier LeO. H.181. This is a two-seat monoplane cabin flying-boat with the engine mounted high above the wing. The hull is built of wood and has a flat bottom with a single step, and is very robustly built. It is divided into a number of water-tight compartments. The monoplane wing is of the full cantilever type, covered with three-ply, and is water-tight.

Two outboard floats for lateral stability are placed nearly half-way between the hull and the wing-tip. They are made in two halves, of duralumin, and are joined along the line of division by a U-section capping strip.

The tail-unit consists of a fin built up from the stern-post with the tail-plane passing through it at mid-height. This is braced by struts from the bottom of the hull. One noticed that the tips of the wooden tail-planes and fin are made of beaten duralumin sheet.

The engine nacelle is mounted above the centre section on rather a light arrangement of struts. The 120 h.p. Salmson engine is placed forward, and drives a pusher airscrew through an extension-shaft coupled to the engine by a flexible plate coupling.

The tanks are in the wing on either side of the hull.

The cabin, which is totally enclosed, is forward of the wing and seats two side-by-side, and the crew enter by sliding back the starboard window, and also sliding back part of the roof. There is plenty of room inside. Dual control of the normal type is fitted. The tubes used for the control-rods seemed unusually large.

On the other side of the stand is the Potez 36, which is a two-seat, high-wing cabin-monoplane, with a 60 h.p. Salmson engine. The wings fold round the rear spar and round hinge-points on each side of the fuselage at the lower longerons. To this point the V bracing-struts are attached.

The machine has a divided-axle under-carriage with long shock-absorber legs attached to points high up on the fuselage. The cabin, which seats two side-by-side, is entered through a door on the starboard side. Dual control of normal type is fitted. The feature of the French stand is the big display of engines made by Lorraine, Salmson and Renault.

The Lorraine Company are showing two new air-cooled radial engines, one a 5-cylinder of 100 h.p. and the other a 7-cylinder of 240 h.p.

Besides the 450 h.p. 12-cylinder and the 650 h.p. 18-cylinder, the company show a 600 h.p. 12-cylinder water-cooled engine of the broad-arrow, or W, type. This engine is noticeable for its clean design and the neat way the components have been fitted in. Four Zenith carburetters are used.

Next to the Lorraine stand is the Salmson firm, who show a range of their radial air-cooled engines, including a big 500 h.p. 18-cylinder. This is unusual in that the double row of cylinders is placed in pairs and not staggered.

The smallest engine on their stand is the 40 h.p. 9-cylinder, which has given such a good account of itself on the various light aeroplanes, especially the Klemm. The 60 h.p., the 95 h.p., and the 120 h.p. engines, which have 5, 7 and 9 cylinders respectively, have their parts interchangeable.

All the French aero engines at the Show are remarkable for their fine finish. A casual observer of the Salmson stand is struck by the neatly finished exhaust collector rings and the unusual type of valve springs employed.

THE HEINKEL EXHIBIT.—The Heinkel E.9 sea-monoplane.

Digitized by Google

These springs are of the type known as the "Arab" cradle spring, when used forty years ago for bicycle saddles. They are not concentrically placed round the valve stems and used in compression in the usual way, but are in torsion, which means that the spring is kept a long way from the hot valve, and thus there is little chance of failure due to over-heating.

The Salmson engines are habitually supported during assembly or usual maintenance work by a shackle clamped to a single valve rocker—rather a startling demonstration of the robustness of the engines.

The heads of the Salmson engines are built up by a special process peculiar to the firm. The closed steel cylinder has the fins of the head, the bosses for the valve guides, the exhaust and inlet ports welded on. The fins are afterwards cleaned up by hand.

Beyond the Salmson stand are a number of aircraft tyres and wheels made by the Palladium Company.

Turning the corner of the stand, one comes to the Renault engine. The makers, besides showing the well-known 12-cylinder water-cooled engines of 500 h.p. and 600 h.p., are also showing a new 9-cylinder air-cooled radial of 250 h.p. Perhaps the most interesting exhibit to people in this country is a 70/95 h.p. 4-cylinder in-line air-cooled engine. This is the French counterpart of the well-known English motors of this type, and no doubt the French light aeroplane movement will profit by having an engine of this kind available.

The price of the Potez 36, fitted with this engine, is £450, which is certainly a very attractive figure for a two-seat cabin-monoplane.

Next to the Renault stand is that of Barbier, Benard and Turenne, who are very well known as the makers of optical equipment for lighthouses. The firm have supplied lighting equipment for aeroplanes all over the Continent, and have also shipped a large amount of material to the United States, where a number of landing grounds are fitted with their products. In the middle of the stand is a revolving beacon with two 8,000 candle-power lamps, each of which is placed between two lenses. These two lights are rotated by an electric motor, and can be seen for over 200 kilometres. This particular lamp has been sold for use in Poland, where a night-flying service is being organised.

There is also a landing floodlight of 20,000 candle-power, mounted on a trolley for use on aerodromes. There is a Neon beacon with a flashing device which can be easily fitted with any combination of Morse signals, enabling pilots to identify the light at once.

Types of small floodlights for the illumination of landing grounds and the like, and using 1,000 or 1,500-watt lamps, are also on the stand, together with wing-tip lights for aeroplanes.

The Rateau stand comes next, and on this are the two types of super-charging compressors made by this firm. One is driven by the exhaust gases, and the other is mechanically operated and can thus be disconnected when not required.

Beyond this is the stand of the *Compagnie Aérienne Française*. This stand is ornamented with maps and the aerial photographs from which they have been made. The Compagnie, besides aerial photography, specialises in taxiwork at a rate of 8 francs per kilometre. They also advertise a cross-Channel service from Calais to Dover for a fare of £1. This includes 10lb. of baggage per person.

Against the wall are stands showing the activities of the *Compagnie Générale Aéropostale* and the *Compagnie Internationale de Navigation Aérienne*. There is also a stand of the *Yacco Compagnie S.A.F.*, who specialise in the production of mineral oils for the lubrication of aero-engines.

Finally, there are the Vinay parachutes. This firm also supplies numerous accessories, such as naphthas, petrol gauges, and the like.

Louis Vinay specialises in the production of parachute equipment and has also patented a caterpillar landing gear.

The parachutes are made in either the seat or back type, have an auxiliary spring "kite" for withdrawing the main parachute and are operated either statically or by means of the usual ring.

These parachutes, like other Continental types, dispense with the harness and employ a deep corset belt with a quick release buckle. This allows the belt to be also used as a safety belt by the addition of two straps which fasten it to the sides of the cockpit, these straps being furnished with quick release buckles.

A leather flying suit, incorporating a pack for the parachute, is also shown. This suit takes the place of harness.

The caterpillar landing gear consists of two sausage or banana-shaped frames round which a rubber tread runs over a number of rollers on ball bearings. These frames replace the normal wheels and are attached to the chassis by a hinge near the rear of the tread mechanism so that the tread can adjust itself to a suitable angle for surmounting obstacles. Westinghouse brakes are also fitted.

THE COLLECTIVE EXHIBIT OF THE ITALIAN AIRCRAFT INDUSTRY.

In the Annexe at the end of the Main Hall are placed the aircraft of the various foreign exhibitors, and in the middle of these is the stand organised by the Italian Air Ministry.

On the end of the stand nearest the main hall are two light aeroplanes, the Ro.5 and the Breda 15. In the centre of the stand is the new 7-cylinder Fuscaldo constant-power engine with the Fiat C.R.20 seaplane in the background.

The Colombo engine is also exhibited, together with scale-models of all the well-known Italian aircraft.

There is shown a plaster model of the Benito Mussolini Medical Institute which is being built for the medical examination of pilots.

The Ro.5 is an interesting two-seat light monoplane with a Fiat A.50 80 h.p. engine built by the Officine Ferroviarie Meridionali, Napoli, for the Italian Government's light aeroplane competition. It is a high-wing monoplane with an extremely wide-track undercarriage.

The fuselage is built of welded steel tubes. The wings are of wood and are braced by "N" struts on each side.

To fold the wing back the front leg is disconnected from the undercarriage structure and clipped to the wing which then folds back on the rear "V," hinging round a point on the bottom longeron. The doors to each cockpit are quite large and permit of very easy access.

Dual control is fitted. This has, as a standard fitting, a device which should be adopted in this country. While in the air the instructor can disconnect the pupil's controls by a Bowden cable, thus avoiding any disaster which might occur through the pupil "freezing onto" the control stick.

The machine shown is of the open type but glazed panels may be fitted round the cockpits and up to the wing, thus converting the machine into a cabin monoplane. There is one fuel tank in each side of the wing.

An unusual feature in a light aeroplane is the provision of flap-gear for decreasing the landing speed. The flaps are the same as the ailerons and extend the whole span of each wing. These can be lowered or raised by a simple screw-gear in the cockpit without affecting their use as ailerons.

The Breda 15 is a two-seater light monoplane with a 85 h.p. Colombo S.53 4-cylinder in-line air-cooled engine. It is a totally enclosed cabin monoplane of the high-wing type, with seats in tandem. As the centre-section is glazed the cabin is very light. Each seat has its own door, the after one being unhandy in that it hinges from the roof.

The undercarriage has a narrow track like the conventional English aeroplane. The wings, which are braced by one pair of parallel steel-tube struts on each side, are folded by uncoupling the front strut, which is supported at half its length by a subsidiary bracing from the wing.

As in the Ro.5, flap gear is incorporated with the ailerons. This is operated by a simple change-over device at the foot of the control column.

The C.R.20 is a most attractive-looking machine and has quite a good performance. The wings are rigidly braced Warren-girder fashion, and the floats are attached by a steel tube undercarriage which is so designed that it dispenses with any cross-tubes. This should considerably decrease the resistance of the floats on the water.

These floats are made of wood and are beautifully finished. The planing bottoms are curved in the same way and appear to have the same lines as the best types of metal floats made over here. This wooden construction allows the floats to be completed with no projections of any kind. The two floats have water-rudders of rather small dimensions.

In spite of the large number of accessories fitted in the cockpit this appears to be very roomy, and the actual covering, which is fastened to the steel tube fuselage, appears to be quite stiff.

The ailerons have the type of balance which Herr Dornier has made familiar, having a small balancing plane mounted above the larger surface.

The Fuscaldo engine has only recently been developed and is an attempt to provide constant power and performance at varying altitudes for light aeroplanes. The crankcase casting is of such a shape that it forms the streamline nose of the aeroplane. The three-bladed airscrew which is fitted is adjustable in pitch and can be operated by the pilot. The engine efficiency is secured by a constant mixture feed obtained by a centrifugal compressor. As a result, the weight-to-power ratio is rather high, namely 3½ lbs. per h.p.

A number of accessories, such as wheels, airscrews, radiators and parachutes, are also shown.

A rather neat engine-starter, or Garelli Air Compressor as it is called, is also on the stand.

Digitized by Google

The tail of the Boulton and Paul Phœnix showing how the two sides of the elevator, which are interchangeable with the rudder, are attached.

(*Continued from p. 242.*)

longerons, the top longerons will be dropped to give a domed roof to the fuselage instead of the present flat one and access to the front cockpit will be improved by hingeing the front portion of the centre-section. At the same time the exhibited machine embodies many good points and at the price it is proposed to sell it—£375—it should find a market. [Personally one regards the two-cylinder type of aeroplane as unworthy of the attention of a big aircraft firm. And this particular style of machine is not likely to find many buyers in any case. One recommends a complete re-design of the whole thing.—C. G. G.]

A section of one of the main rings of R.101 is also shown, together with a longitudinal. Both these are test sections and are something like three years old, but their age is not apparent. A Sidestrand spar 30 ft. long is shown, apparently balancing precariously on its end. Actually it is sunk some 18 inches into the concrete base of the stand.

Various boards and cases show specimens of Boulton and Paul metal construction, such as their patented spar, which is made up from a few standard components into a large variety of spars, and various sections of their patented closed-joint tubes. The closed-joint tube is now being produced in the form of a streamline tube, the rolled joint being down one of the sides.

THE BRISTOL AEROPLANE CO. LTD., Filton.
Stand No. 104.

The Bristol Company are showing two complete aeroplanes and the mock-up of the front end of a single-seat fighter of the *genus Bulldog* with the new Bristol engine-cowling.

The Bulldog, which is exhibited half covered and half uncovered, is of the type which is now familiar to many people. It is in the same state as that shown at the last Paris Show twelve months ago—in fact one feels safe in saying that the Olympia machine is the identical one exhibited at the Salon.

The intervening period during which it has been kept on the ice has not detracted from the impression one gathered originally—that it represents one of the very finest examples of all-metal construction that has been shown to the public at large.

The performance of the Bulldog was shown with considerable effect at the R.A.F. Display on July 13 and as all performance figures were published in the Guide Issue of THE AEROPLANE it is unnecessary to go further into the matter, beyond correcting a regrettable misprint in the Show Guide, which made the Bulldog's speed 148 m.p.h., whereas it is in fact 168 m.p.h.—*without* the supercharger.

The Bristol 110A is an entirely new product and represents Capt. Barnwell's idea of the modern four-seat cabin machine. We are so familiar with the single-engined cabin monoplane as produced in America that the first impression gained when seeing the 110A is that it is not what it is meant to be. The second impression, however, is entirely different.

It is an extremely clean biplane with single-bay wing-bracing, a wide divided undercarriage, an unbraced tail, a

BULLDOG DETAILS.—On the left the interplane struts fitting on the wing spar, on the right the rib attachment to the spar, and above the wheel brake.

Digitized by Google

THE BRISTOL CABIN BIPLANE.—The Bristol 110A. four-passenger biplane with the completely encowled Bristol Neptune engine. —(*"Aeroplane" photograph.*)

fuselage that fills the gap between the wings, and a completely-cowled Neptune engine (7 Jupiter cylinders).

When one compares this with the bigger-spanned monoplane with wing-bracing struts, and undercarriage struts divided between the bracing structure and the fuselage, and a partially exposed radial engine, the claims of the monoplane type are not so obvious.

The fuselage structure of the 110A., which is only exposed on one small portion of the fuselage below the windows on the left side, showed it to be of the "Bulldog" type with the exception that it is of the rigid type with no wire bracing.

The pilot's cockpit is very roomy and has accommodation for one seated centrally on an adjustable seat. The front and roof windows over the cockpit are fixed but the sides of the cupola are permanently open. The cabin seats four passengers, the back two on one wide seat across the back of the cabin and the other two on separate seats, the backs of which fold down. These two seats may be folded sideways out of the way when necessary.

Windows along each side of the cabin are fixed, but above each window is a hinged ventilator which connects with the outer air through louvres in the sides of the fairing between the top fuselage longerons and the upper wings.

There is ample head room but the one entrance by a side-door aft on the right side seems insufficient

Although once in the air no sane passenger should want to get out, yet a feeling that a door is handy from any seat without having to fold down seats and climb over other passengers' legs has a comforting effect on some people. And in a crash the betting is even that the machine falls on the door side and jambs it.

This is quite a minor point, but it is apt to elicit from elderly passengers remarks similar to those uttered when they are invited for a ride in an expectant nephew's sports automobile.

The Bristol engine cowling is similar to the now fairly well-known N.A.C.A. type. It is shown over a geared Bristol radial engine and differs from the N.A.C.A. type in that the front of the ring forms the exhaust ring, all exhaust pipes being led straight forward to the exhaust chamber. This cowling arrangement has been the subject of experiment by the Bristol company over a long period and is only shown because of the publicity given to the N.A.C.A. type.

THE CIERVA AUTOGIRO CO. LTD., Bush House, Aldwych, London, W.C. Stand No. 20.

The Cierva Autogiro Company show the C.19 Mk.I. two-seat light autogiro with the 80 h.p. Armstrong Siddeley Genet engine. This type is the first to incorporate a self-starting device for the rotor. This is in the form of a boxed tail unit, the sides of which form the fins and rudders. The tail plane and elevator form the top and bottom of the box and are staggered in relation to one another. These two surfaces may be turned up through a fairly wide angle and are so related that when turned up they form a continuous chute between the sides of the box which deflects the slip-stream upwards onto the rotor.

The machine has wheel brakes and with the wheels fully braked the self-starting device ensures a rotor speed of 130 r.p.m. in 45 seconds. The machine is designed to lift at 160 r.p.m. so that the take-off run is calculated not to be more than 30 yards.

As soon as flying speed is reached the bottom tail plane may be locked back into place as a fixed surface and the upper plane becomes the normal elevator.

Two stabilising planes are fitted, with narrow chord ailerons and the extreme tips of these planes are turned up at a sharp angle. This angle is so arranged that when the machine is descending vertically the upward blast onto the rotor is calculated to limit the rate of descent to 14 ft. per second.

The Genet engine is completely enclosed with cowling of the N.A.C.A. type, and this blunt nose combined with the big tail unit gives the machine a very stumpy appearance.

The rotating vanes are built round a steel tube spar with box ribs and mahogany planking. The four vanes are mounted on a quadrupod of steel tubes. The steel forged hub incorporates radial and thrust ball-bearings and a braking system.

The undercarriage is of the wide divided type. The oleo legs have a travel of 12 inches and Bendix wheels and brakes are fitted as standard.

The machine is finished in gold, picked out with blue, and the vanes are of varnished mahogany.

Besides the complete machine, a rotor vane and a complete rotor hub are shown.

THE DE HAVILLAND AIRCRAFT CO. LTD., Stag Lane Aerodrome, Edgware. Stand No. 16

On the De Havilland stand are shown three Gipsy-Moths a Hawk-Moth and *the* Tiger Moth. On the most prominent corner of the stand is mounted an all-white Coupé Moth on a pedestal within the base of which are shown, behind glass panels, over seventy cups and trophies won by Moths in various parts of the World. Among this collection are five out of the eight King's Cups in existence. [Some bright person, wanting to get for Olympia that publicity which it has lacked, proposed that Sir Charles Wakefield's King's Cup should be stolen. He felt sure that our respected Sir Charles mourning for such a treasured possession would touch the hearts of even the daily papers.—C. G. G.]

This particular Coupé Moth is exceedingly attractive with its all-white enameled finish. Even the wheels are covered with fabric and enameled white. Along each side of the fuselage is the word "Moth" in huge embossed gold letters. Altogether the prettiest exhibit in the Show. [Personally one does not agree. The all-white enamel makes it look even more like a bathroom than is Mr. Jackaman's, and would certainly be called "The Whited Sepulchre." The

("Aeroplane" photograph.)

colour-schemes of the other two strike one as preferable. But this is purely a matter of taste.—C. G. G.]

The other two Moths are of the metal fuselage type, one with floats, finished in yellow and white, and one with a land undercarriage, in blue and gold. All these Moths have cadmium-plated exhaust-pipes, centre-section struts and bracing wires, and reflect opulence with every ray of light that strikes them.

HAWK-MOTH DETAILS.—Above ar edetails of the di vided undercarriage and below, on the left, typical fuselage joints showing the use of both square and round tubes, and on the right the steerable tail-wheel.

Digitized by Google

THE SIGN OF OPULENCE.—The All-White Coupé Moth on the pedestal containing over seventy cups and trophies.

The Hawk-Moth is shown with a geared Lynx engine, which is installed very neatly. Very little of the cylinders protrudes from the cowling and an oval section exhaust pipe behind the cylinders lies almost flush with the cowling lines. The cabin is extremely well-finished and is very spacious, the back passengers having more leg room than is generally provided in the more luxurious saloon automobiles. This machine is shown with one of its wings half folded.

Its finish is as excellent as that of the Moths except that there is less plating about it. The colour scheme is cream and black, the cabin portion being covered with leather fabric and the after section with ordinary fabric.

The Tiger Moth, which holds the Light Aeroplane Speed Record at 186 m.p.h., appeared on the stand over Monday night and although it was not announced to appear by the company in their pre-show publicity it was certainly a good afterthought.

DESOUTTER AIRCRAFT CO. LTD., Croydon Aerodrome. Stand No. 53.

The Desoutter sports three-seater cabin monoplane is the first of its type in this country. It should make a delightfully comfortable machine for the private owner.

It is the English version of the Koolhoven monoplane and has been developed by Mr. Desoutter in his factory at Croydon in conjunction with Mr. G. H. Handasyde.

The machine is well upholstered inside in grey leather and looks attractive. Externally this one is finished in blue and silver, but a variety of colour schemes are available, as may be seen from the range of pictures which are hung on the stand.

Several modifications have been made in this machine since it came to this country. For example the windscreen has been carried right across the fuselage, the tail-plane has been lowered, and the undercarriage has been strengthened

BENDIX BRAKES
AND WHEELS FOR AIRPLANES

Bendix Disc Wheels and "Servo" Brakes are the most modern development in Airplane control and the landing wheel is the lightest yet produced.

They control and reduce the run after landing to a minimum, thereby ensuring safe landing in small areas.

Eliminate necessity for ground crews, as the machine can be warmed up, taxied and parked in hangar without external assistance.

Provide perfect control on the ground when separately operated, thus preventing disastrous ground loops, and permitting cross-wind taxi-ing and take-off.

Permit the use of a tail wheel instead of a tail skid, thereby avoiding tearing up the Airdrome.

Visit the Bendix Stand at Olympia and examine this ingenious invention.

KING'S CUP, 1929.

We all heartily congratulate Flying Officer R. L. R. Atcherley (who flew under the name of "Mr. Llewellyn") and Flight Lieut. G. H. Stainforth, as navigator, for their very fine performance on winning the King's Cup Air Race this year on a Gloster two-seater "Grebe," fitted with Armstrong Siddeley "Jaguar III. A" engine of 360 H.P. The machine was entered by Sir Walter Preston, M.P. for Cheltenham, and we sincerely hope that it will prove to be only the first of many successes from his entries.

It was truly a very fine performance and every praise is due to the navigator for steering such a fine course, the average over the 1160 miles for the two days being 150.3 m.p.h., this, in itself, constituting a record for the King's Cup Race, the fastest time previous to this being Capt. Courtney's speed in 1923 of 145 m.p.h.

At one period it appeared as though they would not get round, as whilst taxi-ing in at Blackpool at the end of the first day's race, they had the misfortune to get their tail skid in a rut and to wrench off and damage both the rudder and tail plane. Spares were rushed from Cheltenham through the night and it reflects great credit on those who did the work of repairing the machine, when one considers that they did not get to Blackpool until 3.30 in the morning and then worked on the machine without stopping for any rest, with the result that F/O. Atcherley was able to get away in the morning at the proper starting time.

The finish at Heston was most exciting as, at Birmingham, the last control before Heston was reached, Captain Neville Stack, who was favourite on an "Avian," was 27 minutes ahead of F/O. Atcherley with only 92 miles to go. It seemed almost impossible for the Gloster machine to win, but to the intense delight of those backing the "Grebes," instead of the "Avian-Hermes," the familiar silhouette of a "Grebe" was seen coming in low over the trees and the next moment with a good old roar of her Jaguar the Gloster "Grebe" passed over the winning line first, thereby winning the King's Cup.

Captain Neville Stack flew an extraordinary good race and it was very hard luck that his engine should give out on the last lap and he is to be congratulated on the very fine effort he made by completing the race firing on about 2½ cylinders.

The second Gloster Grebe, piloted by F/O. Fielden, also put up a very fine show and had been flying within a few minutes of the winner until, near Castle Bromwich, one of his flying wires broke, with the result that he had to throttle down to about 100 m.p.h. until he reached Castle Bromwich. Here a spare flying wire, which was carried, was fitted; but this, of course, lost him valuable time. As it was, he came in seventh, whereas he stood a very good chance of coming in second or third.

We think F/O. Fielden is deserving of the highest possible praise for the manner in which he completed the course and this sentiment is heartily endorsed by his passenger, Sqdn. Ldr. The Rt. Hon. F. E. Guest, C.B.E., D.S.O.

We take this opportunity of thanking not only all those at the Works who helped to win, by their team work, but also the Officers Commanding the Squadrons at Renfrew, Castle Bromwich, and Hawkinge; Messrs. Vickers, Bristol, Armstrong Siddeley, Boulton and Paul, A. V. Roe, and Blackburns, for the use of their Hucks and Gas starters, etc., and the personnel of the Light Aeroplane Clubs at the various controls for their valuable assistance. Messrs. The Anglo-American Oil Co. and Wakefield are to be congratulated on their very fine organisation for re-fuelling at the controls.

DESOUTTER DETAILS.—On the left the arrangement of the elevator control and on the right an aileron lever.

Splintex glass has been standardised for the cabin windows, which should prove a good selling point.

The whole machine is very well finished, and the detail work is good. The neat aluminium edging to the windows is particularly noticeable, and the engine cowling gives a clean effect to the nose of the machine.

National Flying Services have acquired the selling rights of this aircraft and a large order is now in hand for them. One of their newly uniformed pilots has been stationed on this stand to dilate on the joys of flying in a cabin light-'plane such as this.

FIAT (ENGLAND) LTD., 43-44, Albemarle Street, London, W.1. Stand No. 90.

The Fiat stand is near the middle of the main hall. The exhibits are the Fiats A.S.1 two-seater light plane, and models of the B.R.2 and S.V.A.10 and A.120.

The A.S.1 has the A.50 85 h.p. air-cooled, 7-cylinder, radial Fiat engine. The machine is an attractive-looking little tandem two-seater with a plywood fuselage and normal fabric-covered wings, which are designed to fold. The fuselage is very wide and roomy and the detail finish is better than that in most foreign exhibits.

Dual control is fitted and a Bowden control system allows the pilot to put the passenger's control column out of action at will. The leaf-spring tail-skid looks flimsy and one can hardly recommend a forward curve such as it has unless the idea be to plough drainage furrows on the unfortunate aerodrome or country-club park land.

The undercarriage, of the split-axle type, is quite neat. The ailerons are balanced.

Very complete equipment is standard, and such things as full lighting with a landing searchlight below the centre of the fuselage run off a 12 v. accumulator, headphones, a 30-gallon fuel tank, with reserve tank, and a "Knock-out" centralised pressure fire-extinguisher, are all included.

THE FAIREY AVIATION CO. LTD., Hayes, Middlesex. Stand No. 110.

At the end of the main hall and going down the centre aisle from the Addison Road, one comes upon the Fairey Stand which is really an object lesson in the successful application of streamline to omnibuses. This sounds a bit libellous but really when one examines the contents of the Fairey IIIF Seaplane, even omnibus seems inadequate and pantechnicon seems more to the point. Someone has nicknamed it "The Appendix A,"—as it is equipped with every fitting and gadget mentioned in the Air Ministry's Appendix A list of supplementary equipment.

High over the stand is the historic Long Range Monoplane,—the only machine which has flown non-stop to India. The enormous spread of its cantilever wing overshadows everything. This spread with fabric covering is only made possible by the Fairey patented form of pyramid bracing between the spars. They do say that a Turkish visitor wished to buy the monoplane for hard cash there and then.

At the four corners of the stand are representative examples of the Fairey Reed Airscrew, including a four-blader.

Facing Addison Road is the Firefly II with a Rolls-Royce "F" engine. This is a high-speed Interceptor fighter, built entirely of metal with fabric covering. The biplane wings are of unequal span and chord and have a pronounced stagger. These various devices are employed to give the pilot a good view. The wing-bracing is single-bay on each side with "N." type interplane struts. The ailerons are on all four wings and are interconnected by struts. The

THE FAIREY STAND.—The Fairey Long Range monoplane mounted above the office and a IIIF seaplane, two of the seven machines shown by the Fairey Aviation Co. Ltd.

cooling surfaces are divided between the wing type in the centre-section and a retractable radiator. The fuel tanks are in the wing.

The engine-cowling, as with all the machines on the Fairey Stand, is a striking feature. The cowling appears to have had the engine poured into it and only close examination will show the way the panels are secured with Fairey clips to the main structure.

Along the centre aisle is a IIIF with a Napier Lion engine. This is in skeleton form and shows the type of construction employed. Steel tube for the fuselage and duralumin for the wings. The various tubes are mostly rivetted, this especially applies to the struts between the fuselage longerons. The wings have duralumin spars of double-eight section and ribs of the same material, these have sheet metal diaphragms and specially shaped section booms. These diaphragms or webs are stamped from sheet and the booms or flanges are drawn from strip.

Behind this machine on the middle of the stand is a Fairey all-metal float.

Further along the main aisle are two highly-finished examples of the Fairey High Speed Gun Mounting, an extremely neat device which allows the stowage of the drag-producing gun and its mounting inside the fuselage. The device consists of a semi-circular steel tube mounted at either extremity to the sides of the cockpit and able to be swung that is raised or lowered, about these points. The gun may be moved round this and is also on a swivel joint so that it may be swung in any direction.

The next machine is the IIIF as a three-seat seaplane with a Napier Lion engine. This has a flight of steps placed alongside so that one may go up and see how all the gadgets required for sea warfare are tucked away where they will not upset the slipstream. The wings fold back alongside the fuselage and the aftermost of the outer pair of inter plane struts has a piece bitten out so that it may be hitched onto a projection on the tailplane.

Round the corner is the single-seat ship-plane fighter rather like the Firefly II but with special modifications required for its class of work such as increased movement of the undercarriage and strengthening of the structure t

Digitized by Google

THE FAIREY STAND.—Another view showing the Firefly II, the Long Range monoplane, the skeleton IIIF and some Fairey metal airscrews.

take catapult strains. The fuel is carried in tanks inside the fuselage fitted with jettison valves.

On the far side of the stand is the Fox, which as a type has done much to influence design. This type was originally fitted with the Curtiss D.12 engine but the latest is fitted with the Rolls-Royce F. These day-bombers of outstanding performance out-classed the single-seat fighters in the Air Exercises last year. The Fox, unlike the IIIF, has wings of unequal span and single-bay bracing with "N" type interplane struts.

Further along on the same side is the ubiquitous IIIF in yet another guise, this time as a general purpose two-seat machine with an Armstrong Siddeley Jaguar. Apropos of the IIIF it may be remarked that the type may be fitted with fifteen different engines and has as a result 93 different sets of performance figures, which vary as the types of engines are geared or ungeared and so on.

The Fairey Stand is remarkable for the fact that it is in itself a history of the development of the modern high-performance machine. There is the IIIF the direct descendant of the early type III seaplanes, yet so cleaned up and improved that even to-day its performance is remarkable. The experience which made this possible was gained from the early Foxes and the first Firefly whose design was due to the introduction from America in 1924 of the Curtiss designs for fuselages and wings, and the Curtiss D.12 engines.

Now that the new Rolls-Royce F engines are available Faireys have shown what further can be done. The results as exhibited at Olympia are instructive and wholly pleasing to the eye.

The Fairey High Speed gun-mounting.

THE FARMAN STAND.—The Farman F-190 cabin monoplane with the 230 h.p. Gnôme-Rhône Titan engine
(" Aeroplane " photograph.)

THE FORD STAND.—A general view from the Gallery. "The Aeroplane" stand can be seen, with the eye of faith, above the wing-tip on the right.—("Aeroplane" photograph.)

SOCIETE H. ET M. FARMAN, 149, Rue de Silly, Billancourt (Seine), France. Stand No. 88.

Shown on this stand are two of the aircraft made by the well-known firm of Henri et Maurice Farman.

The first is the F.190 a four-passenger cabin monoplane with the Gnome-Rhone Titan 230 h.p. engine.

This machine has made a name in several recent long-distance record flights. The four passengers are in a rather small cabin and the leg-room allowed does not appear generous. The pilot is alone in an enclosed cabin in the front and has a fairly good view.

The internal finish is plain compared with some of the machines in the show, though of good quality, but the external finish is rather below the standard of most other machines, the doping being very poor. The small round windows for the cabin do not seem adequate for a compartment of this size.

The cabin is heated from the exhaust, which should make it comfortable for the Winter but the ventilation for Summer work hardly looks sufficient.

The Farman F.200, the other aircraft shown, is an open-cockpit two-or-three seater, with the 120 h.p. Salmson engine. This machine has a large cockpit with the pilot in front and the passenger directly behind him on the left-hand side, beside the passenger's seat is a small seat for an occasional extra passenger. The main passenger's seat is fitted with dual control.

The wind screen is unusual as it extends right across the machine and its wedge-shaped panels are taken right up to the wing, thus forming a sort of cabin without sides. A complete coupé top can be supplied if desired.

A stand with pictures shows a selection of other Farman types.

THE FORD MOTOR CO. LTD., Trafford Park, Manchester. Stand No. 33.

Just in front of THE AEROPLANE stand and a quarter right on the far side of the New Hall from the Hammersmith Road Entrance to Olympia is the Ford stand on which is one of the famous Tri-motor All-Metal Monoplanes (Model 5AT), which have caused so much stir in the World.

This machine is completely covered, fuselage, wings and tail unit, with corrugated Alclad sheet which has been highly polished, and makes the exhibit very striking.

Looking round the exterior of the machine one is struck by its business-like finish. Obviously all the surfaces are going to stand up to operating conditions. An attractive feature is the wide track undercarriage with hydraulic brakes and tracking tail-wheel. The clips used to fasten the cowling to the wing engine nacelles are not as neat as their English counterparts. On the other hand the cowling in front of the engine crankcase has adjustable louvres for various temperature conditions, which is a very sensible idea.

The machine is entered from a door in the fuselage half way towards the tail on the starboard side, though, as the cupola covering the pilot's cockpit lifts up an emergency exit could be obtained this way.

Entering the machine and turning left one finds a lavatory, like those in trains and in aircraft generally, not quite as large as one could wish.

Beyond is the interior of the fuselage to the tail unit. In this space is stowed the tail-trolley for handling on the ground, the picketing gear (i.e., mooring stake and ropes), spare kit and engine-starting cranks.

From this after portion of the machine may be gained

THE FORD AIR LINER.—A close-up of the nose of the Ford monoplane showing the engine mountings and pilot's cockpit.—("Aeroplane" photograph.)

Digitized by Google

THROUGH EVERY WEATHER OF THE WORLD!

The many air lines using Fokkers are now covering 15,000 miles a day.

The Avro 10 is the English version of the Fokker F7-3M and it is the finest possible plane for difficult work in extreme climates. It is equipped with three 200 h.p. Armstrong-Siddeley engines, carries 8 passengers, and is entirely British built to the Air Ministry's standard of air worthiness and safety.

Some of these machines run to a time-table through tropical storms; others fly regularly in temperatures far below zero and in Western Canada a fleet of these world known planes operates in summer and winter without hangar protection.

They are used by the Dutch, Swiss, Italian and Canadian air lines, and now Australian National Airways Ltd., have chosen them for their new Brisbane to Sydney Service.

AVRO-10

Cruising speed 100 m.p.h. Range from 400 miles upwards.
Payload up to 1800 lbs.

Specification and full particulars both of the above plane and of the smaller Avro 5 (seating pilot and 4 passengers) will be supplied on application. Those interested should also write for special catalogue of the famous "Avian" light aeroplane.

A. V. ROE & CO. LTD., 166 PICCADILLY, LONDON, W.1. *Works:* MANCHESTER, AND HAMBLE, SOUTHAMPTON.

Digitized by Google

FORD DETAILS.—On the left one of the undercarriage legs and on the right the steerable tail-wheel.

a general idea of the type of construction used. Transverse frames built up from square-section channels are connected with intercostal members of the same class.

These channels have three sides of the same dimensions, flanges being slightly turned in at their outer edges, leaving the fourth side open. The corrugated skin is attached to these main members, and spaced in between the main bulkheads are subsidiary frames. One should point out that the bottom longerons of the fuselage have heavy angle-metal at the two bottom edges.

Going forward from the door one enters the main cabin and is immediately struck by the interior finish and seating accommodation. The cabin feels roomy and has plenty of headroom. It is panelled with some lightweight material and is finished in a shade of very pale green. The chairs are upholstered in leather of a pale shade.

The cabin is electrically lit. There are seven seats down the port side and six down the starboard. As there is also a fold-down seat aft of the door the cabin will seat fourteen. These seats are really comfortable with high backs and are adjustable so that they may be tilted back into the most comfortable position for the individual occupant. The windows extend the length of the cabin on each side. Each passenger can open and close the window by his chair and adjust its blind.

The floor is nicely carpeted with some sort of rubber and is pleasant to walk on. There are gratings in the floor of the centre aisle through which heated air may be introduced for warming the cabin in cold weather.

Under the centre section of the wing and in the roof of the cabin are panels which may be opened giving access to the petrol lines. In this centre section are stowed the three petrol tanks.

The structure of the wing is very similar to that of the fuselage—the spars have flanges of U-section duralumin and these are further strengthened by a closing-plate. The webs, in the centre section at any rate, are channel sections arranged to form a Warren girder. As far as one can see no protective covering is used either in the fuselage or in the wings.

In the bulkhead behind the pilot's cockpit is an instrument panel for the use of the passengers.

Going through the bulkhead into the pilot's cockpit one finds the usual dual control of the wheel and column type. The engine controls are neatly placed midway between the two pilots.

Projecting from the floor and between the two seats is a long ball-headed lever not unlike the gear lever in a modern car—this operates the hydraulic wheel-brakes. Moved directly fore and aft it operates the two brakes together, pushed to one side or the other it operates the individual wheels, so giving easy steering on the ground.

The view from either seat is good. The windscreens in front and on either side have panels which can be opened, and the roof also opens.

There is no doubt that a high-wing monoplane has advantages for commercial use besides the good performance that aeroplanes of this class generally have. It gives the passengers a better view and it costs less for maintenance, as there is no rigging to be done.

This particular machine has a cruising speed of 115 miles an hour, which is rather higher than that of the type of machine we use over here. On the other hand it is only fair to point out that our Armstrong Whitworth Argosies carry twenty passengers for the same horse-power.

[Mr. Manning, the firm's test pilot, who is with the machine, says that it is very easy to fly, and that it can be looped when flying level, without any preliminary dive. Mr. Van Zandt, late U.S. Army Air Service, who has joined the Ford Co., since one met him in the States some five years ago, is most convincing on the subject of the machine's good qualities, and hopes to demonstrate this particular machine at Croydon after the Show, before taking it on a tour of Europe. Mr. Bill Stout is to be congratulated on this fine development of his original tin balloon which appeared at Dayton in 1924.—C. G. G.]

GLENNY AND HENDERSON, Byfleet. Stand No. 19.

On this stand is shown a Glenny and Henderson Gadfly single-seat monoplane with the 40 h.p. A.B.C. Scorpion engine.

The complete machine is shown fitted with the new Pearson Rotary Aileron control, and suspended above the machine is a complete duplicate wing with the standard trailing-edge type ailerons. The Gadfly has previously been fully described in THE AEROPLANE, but the rotary ailerons are quite new, and these appear to be one of the most interesting innovations in the Show.

Each aileron can best be described by being likened to an oyster. Each "oyster" is mounted on a skewed pivot on a shaft located midway between the front and rear spars. Each aileron is connected to the control column, which is so arranged with a differential device that when operating the control for a turn the inside aileron assumes a negative angle of roughly 40 degrees, whereas the outside aileron remains practically stationary.

The "oysters" are so shaped that when in normal flying position the fore-and-aft section is a normal lifting one. When either aileron is turned on its pivot to its maximum position, through an angle of roughly 45 degrees, in addition to assuming the aforementioned negative angle of 40 degrees the normal transverse section becomes a fore-and-aft inverted lift section. The negative angle puts drag on the inside wing, forcing the machine into a normal bank and turn, and the inverted lift section counters any tendency to stall. In gentle turns the use of rudder is unnecessary—in fact, such turns may be made "feet off."

The operation of the ailerons is very simple. At the base of the control column is a triangular plate. Bolts located at the two bottom angles of this plate slide in slots cut in two levers, which are hinged at their bottom ends fairly close together. To the upper ends of these levers are hinged push rods which run to short levers on two pulleys, one on either side near the wing tips. A continuous cable runs round each pulley, and another pulley located on the inclined aileron pivot outside the wing-tip. Side movement of the control column, owing to the pivoting points of the central slotted levers, gives a differential movement to the ailerons.

The wing is in one piece, and is held in position in a recess in the underside of the fuselage by four quick-release pins. The pilot's seat, control column and complete aileron control are permanently attached to the wing spars. The control column is connected to the elevators through a short tube running forward to a cross-shaft which has levers at its extremities. Direct cables outside the fuselage connect to levers on the elevator spar.

To disconnect the wing it is only necessary to undo the four quick-release pins connecting the wing to the fuselage and a pin connecting the short elevator control tube to the control column.

The actual machine shown is the first one built, and

Digitized by Google

GLENNY AND HENDERSON DETAILS.—On the left the differential aileron control and on the right the Pearson rotary ailerons at their two extreme positions.

except for a clean-up and a coat of paint it has received no other attention after flying for six months in tests by various pilots. A duplicate demonstration machine, but fitted with a 40 h.p. Salmson engine instead of an A.B.C. Scorpion, is available at Heston.

THE GLOSTER AIRCRAFT CO. LTD., Cheltenham.
Stand No. 4.

The Gloster Company are showing four machines. These are the Survey biplane, the Gnatsnapper single-seat Shipplane Fighter, an unnamed single-seat Interceptor Fighter and the Gloster IV racing seaplane. A further machine, the Gloster Gannet light biplane of 1923, is merely shown as a decoration over the company's office.

The Survey biplane is in complete skeleton form and is an absorbingly interesting example of Gloster metal construction.

In view of the task for which the machine has been specially designed ease of repair and maintenance have been specially studied. The fuselage is in three detachable sections. The two front portions are of square tubes assembled with flat plates. The rear section is of round tubes assembled with plate fittings pressed to shape.

The wings are built round two built-up lattice spars, each consisting of two corrugated booms inter-connected with vertical and crossed members. The vertical members, with permanently-attached bridge-pieces, form the attachment for the ribs, the latter being in three sections,—the nose portion, centre portion and trailing portion. With the exception of the main booms and the wing tips the whole wing is made up of a number of small easily-replaceable standard jig-built sections.

This form of construction, apart from providing great

THE GLOSTER STAND.—The skeleton of the Gloster Survey biplane which is the main feature of the stand.
("Aeroplane" photograph.)

Digitized by Google

The tail-skid of the Gloster Survey biplane.

rigidity, allows for the ease of replacement of any portion of the spars or ribs under service conditions.

The wings are of the single-bay type and ailerons are on the bottom planes only. Although not shown on the machine the method of wing covering is interesting. The rib flanges have a groove rolled in the section and at spaces of about 3 ins. the groove is pressed up to form an eyelet. The fabric is placed in position with a layer of tape and a stainless steel wire is threaded through the eyelets.

The engines are two geared Bristol Jupiters mounted direct on the bottom wings, the main fuel tanks being in the top wings.

The undercarriage is of the divided type and is of the simplest and most straight-forward design.

The accommodation for the normal photographic crew is vast. In the extreme nose is the pilot's cockpit, for two side-by-side, with windows in the lower half of the nose and the floor.

Behind this cockpit is a compartment with two camera positions and wireless equipment.

Behind this again is a huge cabin with no internal cross-bracing which might serve as a dark-room or a freight compartment, but in the machine shown merely houses a Bristol gas-starter.

Behind this cabin is a further camera position.

This machine forms the central object on the stand.

The companion machine to this was built for the Aircraft Operating Co. Ltd. and is already flying. Altogether it is quite one of the most interesting aircraft in the Show, and is a credit to its constructors in every way.

To its left is the Gloster IV racing biplane, in its attractive blue and bronze colour scheme. It lacks the Venetian sky and sunlight to show it off to the best advantage. Since its days by the Lido the upper wings have been raised to the level of the top of the middle cylinder-block, thus giving the pilot a clear view under it,—formerly these wings projected from the side cylinder-blocks of the Lion. This machine has been looped and rolled by a member of the R.A.F. Schneider Team. It is now shown by courtesy of the Air Ministry,—after having been used by the team as a practice machine. It was in fact in the water on the Monday before the Show opened and it was in Olympia, from Calshot, early on Tuesday morning.

On the two back corners of the stand below the gallery and in semi-gloom are the two latest Gloster single-seat fighters, both of which are exhibited by courtesy of the Air Ministry.

Little may be said about these machines and not much more may be gained by close examination. Both have Bristol Mercury engines. The Gnatsnapper is a single-bay biplane and the unnamed Interceptor-fighter is a two-bay biplane. The latter machine is shown with the Gloster—Hele-Shaw—Beacham variable-pitch airscrew. Both look very truculent and speedy. And both are very beautifully made.

Another interesting feature of the Gloster stand is a progressive exhibit by the Steel Wing Co., a subsidiary of the Gloster Company. This comprises a set of steel wings ranging from those built for the B.E.2d, the Avro 504K, the Avro Aldershot, and the Gamecock, to the latest wings for the Westland Wapiti and the D.H. Moth.

In addition to the Gloster duralumin floats shown on the Gloster IV a pair of floats built for the Gloster Goring are shown, one on either side of the Survey biplane.

Other exhibits include the Gloster-Straussler fuel pump, a large model of the Gloster works and aerodrome at Brockworth, a Gloster exhaust ring suitable for the Jaguar engine and numerous paintings and photographs of Gloster aircraft.

Altogether this is a very fine exhibit, thoroughly expressive of the best type of British aircraft construction and progress.

HANDLEY PAGE LTD., Cricklewood. Stand No. 21

The Handley Page stand is in an unfortunate position in that it is half under the gallery of the New Hall and half in the open. The structure of the gallery gives the impression that it was built of scrap from a disused railway station, with its great naked supporting and cross girders. The railway-station effect is heightened by the principal Handley Page exhibit which comprises the front section of the fuselage of the new 40-seater air-liner now being built for Imperial Airways. This resembles a Pullman car and the staging alongside to allow the curious to gaze on the sumptuous furnishings within might just as well be a railway platform.

The cabin-section of the fuselage of the H.P.42 is beautifully fitted inside and is remarkable for its spaciousness. The pilot's cockpit is in the extreme nose and seats two side by side.

The controls are interesting in that the main control is by a "Y"-shaped control column with a wheel at the extremity of each stalk opposite each seat. The whole column with the exception of the upper halves of each stalk is enclosed in a central box. The result is an uncommon cleanliness which comes as rather a shock after gazing at the cockpits of sundry military aircraft.

Behind the cockpit is a small wireless compartment and aft of this is the front passenger cabin.

THE HANDLEY PAGE STAND.—In the foreground the cabin portion of the 40-passenger H.P.42 air-liner, and behind the fuselage of a Hinaidi twin-engined bomber. —(*"Aeroplane" photograph.*)

What instruments have you on your car ?

AIRCRAFT instruments made by the British Instrument Company are well-known for the accuracy and high quality—but what instruments have you got on your car?

The Car-Thermo is a scientifically calibrated instrument which indicates, upon the instrument board, the temperature where it matters, in the cylinder head.

There is no soldering or drilling to do, the temperature responsive element is inserted through a small hole (made with a cutter supplied with the instrument) in the radiator hose, and is held in position by a neat patented method.

The Car-Thermo is made in many sizes, for flange or sunk mounting, and in different finishes, black or nickel case, silver or black dial, complete **25/-**

The Car-Thermo Safety Gauge

This dual instrument replaces the existing oil gauge and occupies the same hole in the instrument panel, and combines a high-class oil gauge with the well-known Car-Thermo.

A TRIAL FLIGHT—

EXPERIENCE for yourself the thrill of flying—the responsive "feel" of the machine—climbing and gliding with your hand on the controls—and the comfort of air travel. Take a trial flying lesson at Hanworth—an exhilarating half-hour in the air—learning to fly under the guidance of an expert instructor, who demonstrates the simplicity of controlling the modern light aeroplane.

These trial lessons are available to everyone, and the charge of two guineas includes free transport by car to and from the London Air Park; starting out from Trafalgar Square, or from Olympia during the Aero Show.

National Flying Services exists to serve air-minded people. Its Club members enjoy all the concessions and benefits accruing from membership of a large organisation—they will be taught to fly at a reasonable cost—they have the advantage of free use of the London Air Park and Country Club at Hanworth, and of all the Clubs affiliated to the N.F.S. organisation—and they will be supplied with a two-seater light aeroplane on hire at rates as low as 3½d. a mile (£1.1.0 an hour).

Write for our booklet giving full details of the services offered by National Flying Services to those who wish to fly.

The model to demonstrate the action of the Handley Page automatic slot.

The passenger accommodation is divided into two, each cabin seating twenty passengers arranged in pairs on either side of a central gangway.

All seats face forward except those at the front ends of each cabin which face aft. All seats are remarkable for their depth and for the leg-room provided between each set of chairs. The chairs are of three-ply construction, are very light and are upholstered in a striking chintz, or whatever it is called.

The space between the two cabins is taken up by—on the right, looking forward—a cocktail bar complete with counter, bottle-racks, etc., and—on the left—by two lavatories, one for Damen and one for Herren, and a baggage compartment, which has an outside door and has no connection with the interior. A wide central gangway connects the two cabins.

Each seat is supplied with individual hot and cold air control, and an electric bell-push. Also above each seat is an emergency rip panel.

A model of this 40-seater machine is also shown to give an idea of its final form. It will be a very large clean biplane with rigid bracing and four Bristol Jupiter engines, two in the top and two in the bottom planes, all driving tractor airscrews.

Alongside this cabin mock-up is a complete fuselage of an Hinaidi twin-engined night bomber of the standard service type. This exhibit was a last-minute substitution for the Hare day-bomber, which had to be withdrawn at the last moment.

The Hinaidi is too well known for further comment, and a model of the Hare shows what might have been seen in its place had service trials not interfered with the original plans.

A section of an all-metal Hinaidi wing complete with slots and the rear section of the fuselage in welded tubes are also shown.

The action of the Handley Page automatic slot is shown by a small model mounted in front of an electric fan, and this never fails to draw a crowd when set working.

Various specimens of metal construction, together with a Möwe or "Seagull" inflatable life-boat for which Handley Page Ltd. are selling agents in this country, and a selection of photographs of various types of machines which have been slotted complete the exhibit.

THE H. G. HAWKER ENGINEERING CO. LTD., Kingston-on-Thames. Stand No. 22.

The Hawker Company are showing three machines, the Hart two-seat Day Bomber, the Hornet single-seat Interceptor Fighter, and the Tom Tit two-seat training biplane.

The Hart and Hornet are two of the most eyeable military aircraft in the Show, and although one is unfortunately prevented from giving much information one is safe in saying that they must be about the fastest machines of their types in existence.

The Hart is a two-seat biplane with single-bay heavily-staggered wings. The construction is all-metal except the covering, and this construction is shown by a skeleton fuselage of the first production Hart and a wing-spar, both of which are of the Hawker patented type.

It is important to point out that the fuselage skeleton shown *is* the first production skeleton, because the finish is so superb that certain people are apt to conclude that it has been specially finished for exhibition.

This fuselage is in four sections and is of mixed steel and duralumin, the longerons and the more highly stressed cross-members being of steel. It is made of round tubes flattened at the joints, the whole being assembled with flat plates, and steel ferrules and hollow rivets, as described by Mr. Sigrist in THE AEROPLANE some time ago.

By using ferrules it is possible to make field repairs with bolts and nuts in place of hollow rivets.

The spars are built up of two many-sided rolled booms and a longitudinally corrugated web, the whole rivetted together. The object of the booms having a number of flat sides is that wiring plates and other fittings may always be assembled onto a flat bearing-surface, it being so arranged that the sides and top of the booms always present a flat surface.

These booms are now produced in several different sizes,

THE HAWKER STAND.—In the foreground is the Tom Tit and behind in formation are the Hart and the Hornet.—(*"Aeroplane" photograph.*)

Digitized by Google

THE HAWKER TOM TIT.—A two-seat training biplane showing the hood raised over the back cockpit for fog and night flying training.—(*"Aeroplane" photograph.*)

and with webs of different depths they may be used for almost any reasonably sized spar. For tail-plane spars two of the smaller size are rivetted together without a web.

The Hornet is of the same construction as the Hart. Both machines have the Rolls-Royce "F" type engine very completely and neatly cowled. The finish on the machines is of the highest class. There is interest in noting that the Hornet has come straight from Martlesham Heath after 50 hours' test flying and has only had a routine wash down.

The Tom Tit is a two-seat super-training biplane with the Armstrong Siddeley Mongoose engine. It is finished in a most attractive colour scheme with blue and aluminium Cellon dope of a new type which gives a peculiar metalised appearance.

The Tom Tit is of metal construction throughout. The tandem cockpits are very completely equipped. The front cockpit is occupied by the instructor and the rear cockpit by the pupil. The latter cockpit is fitted with a blue leather hood which can be raised by the instructor to simulate fog or night-flying conditions, and the back dashboard is indirectly illuminated and fitted with a turn indicator. All controls, including the tail incidence gear, are duplicated, and both seats are adjustable for height.

The cockpits have been designed, in collaboration with the R.A.F. Medical Service. Incidentally they allow for the use of parachutes. And Sutton harness for inverted flying is fitted as standard.

Hawker Hart fuselage joints and a section of the patent Hawker wing-spar.

The tail-skid assembly of the Hawker Hart.

The interior of the cockpits is done in blue leather and the two neat Reid and Sigrist unit dashboards are also covered with blue leather.

Slots and an oleo-Vee cross-axle undercarriage are standard fitments, and the whole machine gives the impression of super-finish that puts it in the class of the very superior sporting light aeroplane. In the finish shown at Olympia it is far too superfine for the R.A.F. Authorities to let the ordinary fool-pupil loose in it.

A metal float for the Hawker Hoopoe single-seat fighter completes the exhibit.

S. T. LEA, 141, New Bond Street, London, W.1.

Stand No. 6

Mr. S. T. Lea is showing the Klemm light aeroplane for which he is agent in this country. The machine exhibited has a Salmson engine of 40 h.p. and is very attractive.

Its unusual points at once attract attention. It is covered entirely with plywood and it is a low-wing monoplane. So it looks very different from the ordinary types. It is at present made in Germany and may be fitted with either the engine shown or else the 20 h.p. 2-cylinder Mercedes.

One of these machines has become a common sight at o

A simple band brake on the Klemm monoplane.

air meetings as Mr. Lea has had a representative at most of them and slow-flying exhibitions on it have been much admired.

GEORGE PARNALL AND CO., Yate, Bristol, Stand No. 92.

Going down the centre aisle towards the Annexe one finds on the right the stand of George Parnall and Co., where one of the latest two-seat light aeroplanes is being shown, together with the Peto, which has received so much publicity through being designed for conveyance in a submarine.

Designs for a flying-boat to do just this were submitted by Mr. Pemberton Billing to the Admiralty early in 1915, with the intention of bombing Berlin from the Baltic, and was turned down because the project seemed to be inhuman.

Apropos of this a visitor came to THE AEROPLANE stand who was deaf and dumb. He succeeded in making a member of the staff understood that he wished to be taken to see this aeroplane. When he arrived in front of the machine his guide was rather disconcerted by being fiercely questioned as to "who has stolen my idea?"

The position was complicated by the fact that all conversation had to be carried on by a species of shorthand on scraps of paper. The visitor appeared to have suggested to the Admiralty the scheme of conveying an aeroplane in a submarine as far back as 1913 and to have reiterated continually this theory. The guide was unable to satisfy the queries of the visitor, and after being thanked for his kindness left the stranger gazing at the embodiment of his early idea.

The visitor was not Mr. Pemberton Billing—who is certainly not dumb, though he is sometimes deaf to argument.

The Peto is of composite wood and metal construction and has a 135 h.p. Armstrong Siddeley Mongoose engine. The rigidly-braced biplane wings fold back and the float gear is quickly removable.

This small machine, which carries pilot and observer, contains a chart case, observation instruments and a short-wave wireless set, besides the usual equipment for the pilot. The machine has a range of about 200 miles.

The Parnall Elf is an attempt to produce a sports model light aeroplane,—that is to say, a machine with a perform-

PROVED *Performance*

COMPLETE £370

The "GADFLY"

MONOPLANE *Scorpion* II Engine

The "Gadfly" single seater monoplane has been tested in the air for the past few months and established World's Altitude record in the 200 kilo class (subject to official confirmation) shortly after its first tests. It is the only machine on the market with the Air Ministry C. of A. and full aerobatic factor of safety.

All wood construction. No rigging. Wing completely detachable by means of 4 draw pins in under 2 mins. Safety section wing. Can be flown by any A pilot.

Performance.—92 m.p.h. top speed.
Lands at 45 m.p.h.
Climbs 500 feet per minute.

These are not design figures. Running costs and upkeep less than 1d. per mile. Normal range 350 miles.

THE PARNALL STAND.—On the right the Parnall Elf and on the left the stern of the Parnall Peto seaplane. —(*"Aeroplane" photograph.*)

ance comparable with the other standard makes as a M.G. sports model compares with a standard Morris.

To simplify maintenance, the wing-bracing is of the Warren girder type. Another point to which special attention has been paid is the provision of a really good view for pilot and passenger. As a result the wings are staggered and slightly swept back.

The lines of the fuselage are rather attractive, and the Hermes engine is completely encowled.

The fuselage is of the three-ply box type reinforced with spruce members and both cockpits are aft of the upper centre section. This, in conjunction with the stagger, gives the good view to which reference has already been made. A Smith's unit-type instrument board is fitted for the pilot and immediately behind his seat is a large compartment for luggage.

Forward of the front seat there is also an auxiliary locker for tools, kit, and so on.

The dual control is constructed in one unit and secured to the fuselage as a complete panel. The tail unit is of the normal type and the tail-plane incidence has to be adjusted on the ground. All control wires are within the fuselage.

The ailerons extend the whole length of the upper wing; the hinged trailing edges of the lower planes are only for folding.

The undercarriage is of the divided axle type. The axles are hinged to a short vertical strut braced on the centre-line of the fuselage.

The tail skid is of the laminated spring type and has a replaceable cast-iron shoe.

The engine is mounted on a welded steel-tube structure which can be removed as a unit by undoing four bolts. The fuel system is rather novel for a machine of this type. There is a three-gallon gravity tank in the centre section which is fed by a force-pump from the 20-gallon main tank carried in the fuselage. There is interest in noting that the cruising speed is calculated to be 103 miles an hour.

S. E. SAUNDERS, LTD. East Cowes, I.O.W.
Stand No. 105.

If the visitor to Olympia goes into the main hall by the Addison Road entrance, then the thing which will probably catch his eye is a study in blue. This is the *Cutty Sark*, the first twin-engined cabin-monoplane flying-boat to be produced in this country.

The boat, shown by S. E. Saunders, Ltd., has two Hermes engines carried on trestles above the wing. But a single engine of 200 h.p., or even 300 h.p., may be installed.

The *Cutty Sark* has a single-step hull of the all-metal type, with a cantilever three-ply covered wing. It is the blue-painted hull and wing floats which catch the attention as one comes in.

Examination of the hull shows that all the sheeting used is flat plate, which considerably facilitates manufacture and repairs.

Just forward of the step are two flaps which lie close along the hull. These are drogues to assist control while taxying on the water.

The wing floats, which are placed not quite half-way to

THE PARNALL PETO.—A side view showing the machine with its wings folded. —(*"Aeroplane" photograph.*)

Digitized by Google

The tail of the Saunders Cutty Sark flying-boat.

the wing tips, are of similar construction to the hull, and have no step. Each is supported by four struts, together with two inwardly sloping diagonal struts.

Provision is made on the hull for fitting beaching gear. This consists of a hollow axle built into the hull through which a detachable axle can be passed. The latter has aluminium wheels which are brought into use by a cam action operated by hand-levers.

In the bow is a compartment for the stowage of anchor and other marine gear. It has a water-tight hinged hatch.

The cabin, which is aft of this and forward of the wing, is completely enclosed with a front screen of non-splintering glass and sliding glass side-panels. The roof panels are of Cellon.

Entry to the cabin is on the starboard side by sliding backwards the side-panel and a portion of the roof.

There are four seats inside, arranged in two pairs. The passageway is lower than the floor on which the seats stand, and thus gives sufficient headroom. The interior of the cabin is attractively finished in some form of leather fabric.

In a bulkhead behind the back seats is a sliding panel through which to reach the hatch in the centre section between the engines and the rear of the hull.

Three bunks may be fitted in this space if the boat is wanted for long cruises.

Dual control is fitted, the pilot sitting on the port side.

The parallel-motion rudder-bar has adjustable foot-rests.

Just in front of the pilot's seat, and under his legs, are the two levers for operating the drogues. These may be opened simultaneously to act as brakes, or may be used independently for steering. The flaps are spring-loaded, so that contact with flotsam will cause them to lie back against the hull, thus avoiding damage.

The throttle control is centrally fixed on the dashboard. Just below the window on the left of the pilot is a special bollard, so that the pilot may slip his own moorings.

For a similar reason a triangular space in the roof may be hinged backwards, which allows the pilot to stand and pick up his moorings.

Owing to the fact that the main petrol-tanks are in the wing, and thus remote, and that no petrol pipe enters the hull, it is quite safe to smoke in the cabin.

The two Hermes engines are contained in nicely streamlined nacelles, each of which carries a gravity fuel-tank, to which the petrol is pumped from the main wing-tanks.

The Heywood starting system is used. This consists of a compressed-air reservoir, which is automatically kept at its maximum pressure by a compressor driven by one of the engines, the compressed air being used for starting the engines.

A full reservoir contains enough air to start the engines six times, if all goes well in the engines.

The wing is of the familiar Fokker type, is entirely water-tight, and is capable of floating the whole machine, or taking the place of a wrecked outboard float.

The fin is built up of duralumin from the stern of the hull, and has a removable panel to give access to the controls.

The tail-plane, elevators, and rudder are of welded steel tube, with fabric covering. The tail-plane is adjustable from the pilot's cockpit, and the rudder and elevators are balanced.

The price of the *Cutty Sark* is £3,500, and the amphibian gear which can be fitted is an extra of £250.

A good deal of interest has been shown by private individuals in this exhibit, and orders for it should not be difficult to get. Also, if light aeroplanes be accepted, as they are, for use as training machines in the R.A.F., there should be no doubt about the usefulness of the *Cutty Sark* in the training of pilots of twin-engined flying boats.

THE SHORT SINGAPORE.—A close view, from the Gallery, of the Singapore I showing the neat cowling of the Rolls-Royce "H" engines. —(*"Aeroplane" photograph.*)

Digitized by Google

SHORT AMPHIBIAN FLOAT DETAILS.—On the right one side of the cantilever axle and on the left the combined water-rudder and tail-skid.

SHORT BROS. (ROCHESTER AND BEDFORD) LTD., Rochester. Stand No. 107.

The Short Stand is quite close to the entrance from Addison Road, being in the left-hand corner of the main hall as one comes in. Placed as a rail round the stand are a number of the Short firm's own type of all-metal spars, the largest of these being for the new Short three-engined monoplane. These spars are 47ft. by 14in. by 8in., and look very fine in their anodically-treated finish.

Of course, the most striking feature of Short's exhibit is the Singapore Flying-boat, in which an extraordinary amount of interest is shown by the General Public, who wait in queues for the chance of entering by the rear cockpits and passing out to the front. One old lady had come up from the country specially to see Sir Alan Cobham's machine, and insisted on being allowed to see where he sat "all the way round Africa."

As is well known, the original Singapore put up a very fine show during the Baltic cruise with other types of flying boat, and was later lent to Sir Alan Cobham by the Air Ministry for the Sir Charles Wakefield Survey of Africa. This flight was a great triumph for the flying-boat, and illustrated the advantages of the all-metal construction.

As a result of the success of the Calcutta type, the makers felt that the performance of the Singapore might be even further improved, and so a kind of face-lifting operation took place. The lines of the planing bottom were modified to those of the Calcutta, and at the same time Rolls-Royce H10 engines were fitted, instead of Condors.

To accommodate these engines, new streamlined nacelles were built, and the radiators were slung over the nacelles under the centre-plane. The result has been to increase the permissible overload to 27,000lb. (over 12 tons), the time of take-off has been reduced to 16sec., and the top speed at sea-level has been increased to 128 m.p.h.

The range is 950 miles at cruising speed.

The wing structure is unusual for a craft of this size, in that single-bay bracing is employed, with outwardly sloping interplane struts—as the top wing is of considerably larger span than the lower wing.

Ailerons and slots are fitted along the top plane only. A monoplane tail and single fin and rudder, together with the main wing structure, give the whole craft the appearance of a high-performance fighter rather than of a large flying-boat.

The hull is built like all Short machines, with transverse bulkheads and a stressed skin put on in rings, employing only local stiffening. In front is a cockpit with a gun-ring for taking bomb-sights and picking up moorings. Aft there comes the side-by-side cockpit with dual control for the pilot, and his relief. And aft of the wings are two staggered cockpits for two more gunners. The interior is roomy and contains wireless equipment, and navigating chart table, and also the fuel gauges and controls for the engineer.

The spars are of the usual Short type, with ribs built of duralumin tube. The whole is covered with fabric.

Close to the Singapore and in the centre of the stand are two Short all-metal chairs of the type developed for use in the Calcuttas. These chairs are fitted with pneumatic upholstery, and are very comfortable. They have the additional advantage that the air-cushions are arranged to form a life-saving jacket. The entire upholstery can be grabbed from the chair and put on immediately, as there is one cushion on the wearer's back and one on their chest. These cushions are held by a strap passed between the legs. This device will hold anybody in the water quite erect and comfortably.

The next thing on the stand is interesting in a very different way. This is an amphibian gear for light aeroplanes fitted to a Gipsy Moth. Many people have expressed the opinion that for really interesting private flying a machine ought to be able to land on either water or ground at choice. Also, for the purpose of long tours in unknown territory and for long flights which include stretches of sea, the risk of forced landing would be greatly reduced by the adoption of amphibian gear. The Short gear consists of a central float carrying an axle with a fork at either end, which incorporates shock-absorber gear and carries the wheels. A screw mechanism rotates the cross axle, and so the forks and the wheels can be lifted up until they are quite clear of the water. The lateral stability of the machine is secured by small wing-tip floats.

The Short Mussel Mk. II., a two-seat low-wing monoplane, is also shown on the stand as a twin-float seaplane though an alternative wheel undercarriage is shown alongside the machine.

It is built like the Singapore, with metal fuselage and metal wing-skeletons covered with fabric. These are braced to the fuselage with a pair of short struts on either side. The robustness of the construction of this machine makes it particularly useful for club work where instruction on seaplanes is required. The original Mussel was moored out for many thousands of hours on the Medway without damaging the structure.

A pair of floats for a machine of about 5,000lb. overall weight are the only reminder of the fact that Shorts have made quantities of floats for clients all over the World, and for a large number of firms in this country. All D.H. Moth seaplanes are fitted with Short floats, and a good many score pairs have been supplied for this purpose alone.

There is also a model of the three-engined commercial monoplane now being built by the firm. This machine is noteworthy as a change-over from the use of the flying-boat for heavy commercial work to a very large twin-float seaplane. Such a change makes it possible to build the fuselage more lightly than the corresponding hull of a boat.

SAFETY.—Actual photograph taken from an accompanying plane of six members of the Royal Air Force jumping simultaneously with IRVIN Air Chutes from Vickers Virginia bombers.

Jump—

----Zip!

IT'S OPEN.—You're safe! Your fall stops. You rest in mid air. And then relax.

You glide smoothly, easily groundward, sharing the long-proven confidence of certain safety that Irvin Air Chutes have bred all over the world, in the minds of men who fly—and sometimes jump.

Scores and scores know what a life saver this is, from their own wide experiences in the air.

Already more than 200 aviators have been saved by use of their Irvin Air Chutes when naught else could possibly have brought them safely down.

Among these are aviators in the Air Forces of Great Britain, Japan, Sweden, Denmark, Poland and the Argentine Republic, as we as scores in the United States.

A number indeed have been saved in commerci operations.

Many of the emergencies were of the most extren nature, and in every case the Irvin Air Chute function perfectly.

After thorough investigation and rig comparative tests, many Governments ha adopted the Irvin Air Chute as the standa life-saving equipment for their Air Force

If extreme emergency—all unannounc as it usually comes—suddenly confronts y in the air, will you, too, be ready to m it with Irvin confidence?

TWO GREAT TRIUMPHS ON

Pratts

KING'S CUP

AND SIDDELEY TROPHY WON ON PRATTS SPIRIT

"I had just that extra speed to pull it off!" said Flying Officer R. L. Atcherly, who made a new record for the King's Cup of 150.3 m.p.h. The second place and the Siddeley Trophy were also won on Pratts—by Lieut. L. G. Richardson, R.N.

SOUTHERN CROSS FLIGHT

ON SPIRIT AND OIL SUPPLIED BY PRATTS

Congratulations to the intrepid aviators, Captain Kingsford Smith and his companions of the "Southern Cross," upon their epoch-marking Flight from Sydney (Australia) to Croydon.

THE COMPER "SWIFT" C.(L.A.)7.

40 H.P. A.B.C. SCORPION ENGINE

A SPORTING SINGLE-SEATER FOR CLUBS AND PRIVATE OWNERS

Excellent in its performance

High Flying Speed 105 m.p.h.
Landing Speed - - 35 m.p.h.
Cruising at 80 to 90 m.p.h.
Range - - - - 350 miles.
British Airworthiness Certificate, Aerobatic Category.

Economical to Maintain

Petrol consumption averages 40 miles to the gallon. Built absolutely without rigging, all parts of the "Swift" are easily accessible. Quickly folded, by one person, into space 7 ft. x 18 ft. x 5 ft.

£400

Second magneto fitted at slight extra cost.

Comfortable and easy to fly

The roomy cockpit of the "Swift" is equipped with an adjustable seat and rudder bar to suit the pilot's convenience. The degree of visibility is exceptional.

FIRTH AIRCRAFT STEELS

ALLOY STEELS FOR EVERY PURPOSE.

BRITISH steels and British Craftsmanship are to-day winning successes everywhere. Firth Steels have been extensively used in almost every British world record-breaking achievement on land, water, and in the air, and Thos. Firth & Sons Ltd. are proud to have been associated with the following triumphs :—

FIRST NON-STOP FLIGHT TO INDIA:

Connecting Rod, Auxiliary Rods, Cylinders.

LAND SPEED RECORD OF 231.36 M.P.H. BY SIR HENRY SEGRAVE IN HIS "GOLDEN ARROW" CAR, DAYTONA, U.S.A.:

Cylinders, Inlet Valves, Camshaft and Camshaft Gears.

SCHNEIDER TROPHY WINNER—SUPERMARINE-NAPIER S.5, VENICE, 1927, AT A SPEED OF 284 M.P.H.:

Cylinder Forgings, Camshafts, Reduction Gears, Inlet Valves.

And also for parts in connection with the following :—

CAPT. CAMPBELL'S "BLUE BIRD" CAR at Verneuk Pan, 1929, at speeds of 211 m.p.h., 216 m.p.h. and 217 m.p.h.

ENGLAND TO AUSTRALIA FLIGHT by the four R.A.F. Supermarine Southampton Flying Boats.

The whole resources of our technical and research departments are at your disposal for the solution of any problems connected with aircraft steels, and we cordially invite discussion.

Visit our Stand C/78 at the International Aero Exhibition, Olympia, July 16—27.

SUPREME THROUGH THE YEARS

1913

This was the year when Palmer produced the first Landing wheels and Tyres specially designed for Aeroplane use. Palmer was the only tyre manufacturer who made any intelligent effort to grapple with the problem of supplying Aircraft constructors with suitable Landing Equipment.

1914-1918

These were the War years when the entire British demand for Aeroplane Landing Wheels and Tyres was met by Palmer. Every British machine which left England was equipped with Palmer Landing Wheels and Tyres.

1919-1929

In the years since the war continuous research and new technical advances have kept Palmer Landing Wheels and Tyres first in efficiency and popularity. They have been chosen for all the notable flights undertaken on British machines, they are fitted as standard equipment on the great majority of British machines and they are used in every country in the World where Aeroplanes are employed.

PALMER

And now comes the Palmer Aircraft Brake which satisfactorily solves in an exceedingly simple manner, the problem of an efficient braking device for aircraft. All who are interested in safer flying should get particulars of this—the latest Palmer innovation.

THE PALMER TYRE, Ltd.,

SIMMONDS AIRCRAFT LTD., Woolston, Southampton. Stand No. 54.

The Simmonds Aircraft Company are showing two Spartan biplanes, one a three-seater with the Cirrus-Hermes engine and the other a two-seater with the Cirrus III engine. The former is finished in silver with a blue deck and the latter in orange and black, the colours of National Flying Services Ltd.

Both these machines, naturally, incorporate the patented inter-changeable wings, tail surfaces and undercarriage units.

An ingenious working model demonstrates the first-mentioned feature. This model consists of a small Spartan fuselage complete with centre-section, tail, undercarriage and one wing which is mounted on a rail which runs from one bottom wing root to the other over the centre-section. This wing successively stops at each wing position as it goes from one side to the other.

The Cirrus engine on the two-seat Spartan is totally enclosed and the airscrew is one of the new detachable-bladed Metal Propeller Co.'s light aeroplane airscrews, the boss being covered by a spinner.

The cylinders of the Hermes engine in the three-seater are uncowled, but the cowling round the engine from the fireproof bulkhead, as on the two-seater, is of aluminium and finishes in a spinner.

The three-seat model has the pilot's cockpit in the same relative position as in the two-seat machine, but the front cockpit is much larger and has accommodation for two passengers, who may be seated either both facing forward or facing each other.

When the three seats are not needed the front seat may be removed, and the cowling above it may be closed over. And if necessary dual controls may be fitted.

The finish on the machines, in Hall's paint, is excellent.

Unfortunately the Simmonds stand is in a rather out-of-the-way position. It is one of the only two British stands, the other being the Desoutter, in the Annexe,—which is otherwise given over to the Foreign exhibits. Originally the Simmonds Company planned to show three machines, but the reason for withdrawing one is too obvious.

A full specification of the Spartan was given in THE AEROPLANE Show Guide, so it is not necessary to repeat it here.

The front cockpit of the three-seat Spartan showing the hinged windscreen.

THE SUPERMARINE AVIATION WORKS LTD., Southampton.

VICKERS (AVIATION) LTD., Weybridge. Stand. No. 85.

The visitor to the main hall immediately has his eye caught by the big wings of the Vickers Victoria and the Southampton Supermarine, which show clearly above the other exhibits. Making one's way to that part of the world, one finds that there are four aircraft on this combined stand, the Vickers F 20/27, which is a single-seat intercepter fighter, the Vickers Victoria, which recently made history at the evacuation of Kabul, the Supermarine S5, and the Supermarine Southampton. This last is actually one of the four flying boats which made the great flight to and round the Far East.

The Vickers Interceptor Fighter with the Bristol Mercury engine.

The F 20/27 is remarkably interesting as a new type for the Air Force. It is a low-wing intercepter fighter and has all its aerofoil surface covered with duralumin sheeting. External examination shows this machine to be fitted with wheel brakes and to have an undercarriage of the divided axle type.

The wing-covering is attached by the Vickers Wibault patent process, and consists of panels of duralumin attached to the ribs by upturned edges, these edges and the sandwiched rib being afterwards covered with a U-section capping strip. The fuselage is metal-covered as far aft as the cockpit, and thence fabric-covering is used. The engine is a Bristol Mercury II.A.

The Victoria is completely stripped on the starboard side, so that the methods of construction may be examined, and very instructive such an examination proves to be.

As is well known, the Victoria is a twin-engined biplane with Napier Lion XI. engines, in nacelles between two pairs of interplanes struts at the extremity of the centre-section. Beyond this the outer wing-panels have two bays of bracing. Ailerons are fitted on all four wings.

The spars are of the wandering-web type developed by Vickers. This is extremely simple, and consists of two flanges of channel section, with a web which zig-zags from side to side, and is rivetted to the flanges of the channels. The ribs normally are of tubular construction, though ribs doing special duties are of special section. The slots which are attached to the upper plane are built by the Wibault method.

The interplane struts appear to be made of thick-gauge duralumin sheet folded to shape and fastened down the trailing edge. The biplane tail is also of complete metal construction with fabric covering.

The forward portion of the fuselage is a plywood structure built over formers of "O" section. The after-part of the structure is duralumin. After examining the Ford machine one was struck by the fact that a tail-*skid* and not a tail-*wheel* is fitted to the Victoria.

There is a pair of wheels under each engine nacelle. Alongside the fuselage are steps, so that one may look inside the

Digitized by Google

THE VICKERS STAND.—The nose of the Vickers Victoria with the Interceptor Fighter in the background.
("Aeroplane" photograph.)

cabin and see the canvas seats for the twenty-two infantrymen. Dummy bombs are shown in position on the bomb racks.

The Supermarine S5, which won the Schneider Trophy in 1927, is mounted high, so that it appears to be diving at great speed. This machine does not therefore divulge many of its constructional features. The fuselage is built of a number of metal frames connected by a metal skin, which is reinforced with longitudinal stringers. The forward portion of the machine is strengthened to act as the engine-bearer. The tail unit is of the monoplane type, with the fin built into the fuselage. The biconvex wooden wings are covered with special wing radiators.

Bracing is by streamline wire to the top of the fuselage and to the floats. The twin floats, which are carried by four outwardly sloping struts from the fuselage, have no cross-axle and are braced by wire. These floats are of very deep section and are built of transverse frames attached to a single longitudinal member. The whole is covered with duralumin sheet. The starboard float carries the main petrol tank, and the auxiliary gravity tank is in the fairing of the starboard cylinder block.

Next to the S5 is the Southampton, looking very spick and span. The all-metal hull looks in very good condition after its long trip. [It might have been more convincing if the barnacles had been left on it.—C. G. G.] The metal hull is built with transverse frames and intercostals. The whole is covered with sheet duralumin.

There is a cockpit in the bows for a gunner and bomber and a bomb-sight is attached to the nose of the hull. Aft of this are two pilots' cockpits arranged in tandem; these are over to the port side, so there is a clear passage-way along the inside of the hull for the crew.

The interior of the hull below the wing is equipped for wireless, and, during long cruises, for the living accommodation for the crew. There are adjustable portholes fitted in the hull for ventilation.

Aft of the wings are two more cockpits—staggered to improve the field of fire.

The tailplane is a braced monoplane with three equal sized fins and rudders. The centre-section has rigid bracing in the form of a W, in between the legs of which the engines are mounted. The engines may be removed, lock, stock, and barrel, for purposes of maintenance or repair.

THE VICKERS STAND.—The Vickers Low-Wing Interceptor Fighter with the Bristol Mercury engine.

—AND IN THE AIR

The firm which makes the Exide Battery makes nothing but batteries. All its force—all its focus is turned on this one single purpose and point. And so it is that whenever the self-starter on the car must on no account fail, it is the Exide Battery that is used. As on the road and on the track so it will be in the air. When every aeroplane has its self-starter, you will see the Exide Battery in the position of trust.

Obtainable from all reputable dealers and Exide Service Agents. Exide Service Agents give service on batteries of all makes.

ESAVIAN Folding & Sliding DOORS

FOR

AEROPLANE HANGARS

ESAVIAN Folding & Sliding DOORS

The Unique Principle

The Esavian Folding and Sliding Doors are hinged to Sliding Uprights (patented) These uprights slide with the greatest ease, being fitted with purpose made Ball-Bearing Runners which carry the weight of doors of any height. Esavian Doors over 20 feet high can be fitted with Winding Gear (patented) so that they can be opened by one man.

The Test

Esavian Fittings have been supplied to the Government for Doors to cover over Ten miles of openings. These openings vary in height up to 3 feet and in length to 100 feet. Esavian Doors were fitted to the Hangar at Heston Aerodrome, 19 feet in height and 100 feet in length, and are also being supplied to Hanworth Park.

Esavian Doors, 32ft. high and 70 ft. long, fitted at Henlow Aerodrome.

General View of the Westland Stand, with the Westland IV in the background.—(*"Aeroplane" photograph.*)

Ailerons are on all four wings. The main fuel tanks are slung beneath the upper plane.

The English Steel Corporation, who are associated with Vickers, show a large aero-engine crankshaft and some duralumin stampings, crankcases, and the like. This firm specialises in the supply of forgings for crankshafts, and has supplied those used in many of the recent notable flights.

There are enormous numbers of subsidiary exhibits scattered over the stand, such as specimen test pieces and sections of a wing radiator, together with typical drawn duralumin sections and welded fittings. There are Vickers guns of all types and sizes mounted on demonstration structures, gun-sights and bomb-sights, bombs and bomb-carriers, bomb-releases and ammunition for the machine-guns. There are also the various types of training apparatus, such as the instructional fuselages fitted with machine-guns and a camera gun fitted on a demonstration mounting.

The variety of detail makes one realise that not only do Vickers, Ltd., supply the aircraft, but that they have an enormous organisation producing and designing the weapons without which those craft would be useless in time of war. To round off these activities, Vickers produce the requisite training apparatus to ensure that these weapons are properly used.

There are also exhibits illustrating the A.G.S. parts, produced at Weybridge, besides the various fuel-line fittings, oleo shock-absorbers, Potts oil-coolers, hydraulic brakes, and the like. In fact, this stand makes one believe that Vickers are the Selfridges of the Aviation World.

THE WESTLAND AIRCRAFT WORKS LTD., Yeovil.
Stand No. 28.

The Westland Company are showing the Westland IV limousine, a Wapiti of the latest service type, with the Jupiter engine, a Wapiti skeleton fuselage with the Jaguar engine and the Widgeon light aeroplane.

The Westland IV is the first of the production type, and the particular model shown has been sold to Imperial Airways. It differs from the first of the type in that it has three Cirrus-Hermes engines in place of Cirrus IIIs. It is now of all-metal construction and has an oleo undercarriage in place of the ordinary rubber suspension type.

The cabin seats four, two facing forward and two aft. The front right-hand seat-back folds forward to give access to the pilot's cockpit. Between the front and back seats are small folding tables. The cabin is very comfortably furnished, is fitted with openable windows and hot and cold air control. The seats have pneumatic seat and back cushions which are interconnected and form lifebelts when removed from the seats.

Behind the cabin is a lavatory and small vestibule to the door, above which is the emergency ripping panel. Behind this is a large luggage compartment.

The pilot's cockpit has a separate door, an adjustable seat and full wireless equipment. The top of the pilot's cupola folds back. And a minor detail of interest is the fitting of a back-view mirror over the windscreen which enables the pilot to see that everything is clear of the tail when taking off.

The Hermes engines are completely enclosed and the side-engine exhaust-pipes are now taken aft parallel to the wing-chord in an effort to eliminate noise as much as possible.

The undercarriage now consists of two standard Westland oleo-legs attached under the engine-mount behind and parallel to which runs a forked torque tube. The bent axles are hinged to the bottom fuselage longerons and the radius rods now run to the fuselage instead of to the rear wing-bracing strut fitting on the engine mounting. Bendix-Perrot wheel brakes are now fitted as standard.

The standard Wapiti calls for very little attention, as it is shown in the covered state and is of the type which has been fully described and illustrated before.

The skeleton Wapiti fuselage has the Jaguar engine and the new split undercarriage. It is a very bare skeleton and none of the interior fitments are shown, except the main fuel tank. The fuselage is of square tubes assembled with flat plates and is wire-braced in the side-panels only.

The bottom bays are unbraced, and the top and transverse bays are braced with diagonal tubes across the corners.

The undercarriage is similar to the standard cross axle type, except that the axle is now in halves which are bent up and hinged to a Vee cabane under the fuselage.

Specimens of Wapiti wing construction are shown separately.

The Widgeon light monoplane is a perfectly standard type finished in a green and cream colour scheme. This has the metal fuselage, the new cross-axle undercarriage and other details which have been fully described and illustrated in previous issues of THE AEROPLANE.

The fin and rudder framing of the Westland Wapiti

Digitized by Google

WAPITI DETAILS.—The tail-skid and the divided undercarriage.

It is rather a pity that the Wapiti was not shown with the complete desert equipment which this long-suffering animal is called upon to carry by the R.A.F. It could then be appreciated by the unknowing. Although it is possible to publish an inventory of this equipment such a list would not be half as convincing as say a half-stripped fuselage with all impedimenta *in situ*.

[NEXT WEEK.—Accessories, Components and Materials.]

AN ITALIAN VISITOR.—The Romeo (Fiat A50).

THE REDRUP TAKES THE AIR.—The Redrup Lever Engine in a Spartan biplane is here seen getting off the ground at Hamble on July 17. This is the first time an engine of the static "barrel" type has flown in this country, though claims are made that rotating-barrel engines have flown in America and on the Continent of Europe.

NATIONAL FLYING SERVICES.

On July 17 the Statutory Meeting of National Flying Services Ltd. was held at Northumberland Rooms, Grand Buildings, Northumberland Avenue, W.C. Sq. Ldr. the Rt. Hon. F. E. Guest, D.S.O., Chairman of the company, presided.

In the course of his speech he said that a great deal of development work had been done at Hanworth and that the company had decided on the first week in September for the official opening of the Club by which time the whole of the aerodrome will have been cleared and levelled and all the buildings, which will consist of five hangars with the necessary workshops, stores and offices, both for Hanworth and for the whole of the company's organisation, will be erected and in full working order.

In the provinces, of the ten centres which the company has undertaken to equip as their first stage of development, they are on the point of signing agreements with three and hope to start on the erection of buildings in the next two or three weeks.

With two others the company expects to reach a final agreement within a few weeks and with four more they are awaiting the conclusion of negotiations for the acquisition of the chosen aerodrome sites.

Negotiations for the establishment of eight other centres are in progress and tentative discussions are taking place with a further large number.

N.F.S. hope that the initial ten centres will be equipped and operating this autumn and that at least three and probably five will be opened in September in addition to the main centre at Hanworth.

As regards technical equipment the company has adopted four types of aircraft. These are the Desoutter cabin monoplane, the Blackburn Bluebird, the Simmonds Spartan, and the A.B.C. Robin. Of these aircraft the company has acquired the sole World distributing rights of two makes, and for the other two, together with certain other types, the company has been appointed selling agents. In addition the company is placing an order for a new 3-engined six-passenger cabin monoplane.

The company has been approved by the Air Ministry as one of the two outside organisations which are authorised to approve aerodromes for Air Ministry licences.

Arrangements are under discussion for the company to be appointed one of the three organisations authorised to supply route information and for the London Air Park at Hanworth to be established as a Customs and Emigration Air Port.

The company has obtained the services of Mr. Neville Stack as chief pilot. He is at present superintending the selection of additional pilots, who will be taken on as required.

The above points are the most important of those raised by the Chairman. The proceedings terminated with a vote of thanks, with which was coupled an appreciation of the progress which has been made to date.

NATIONAL FLYING SERVICES IN SOUTH AFRICA.

As the result of a visit to South Africa by Mr. G. E. F. Boyes, the Deputy Managing Director of N.F.S., the company has been appointed British representatives and consultants and sole agents to Union Airways Ltd., of South Africa.

This company has concluded a satisfactory contract with the Union Government for the payment of a Government subsidy for the air transport of mails between Cape Town, Port Elizabeth, Bloemfontein and Johannesburg, and also between Port Elizabeth, East London and Durban.

Major A. M. Miller, D.S.O., M.L.A., who was instrumental in forming Union Airways Ltd., expects that the company will establish taxi centres and flying clubs in South Africa on the same lines as N.F.S., and arrangements have been made between the two companies to work in close co-operation in their common interests.

THE FORUM CLUB.

The Forum Club has formed an Aviation Group under the presidency of the Hon. Lady Bailey, the object of the Group being to further the interests of British aviation. The Hon. Mrs. Forbes-Sempill, wife of Col. the Master of Sempill, is acting as Chairman of the Group. An interesting programme of activities has already been planned. One of the Group's first actions will be to hire a ten-seat cabin machine, complete with Sir Alan Cobham as pilot, to fly to the Hull Air Pageant on Oct. 10.

EUROPE—ICELAND—EUROPE.

On July 19 Herr von Gronau, of the Deutsche Verkehrsfliegerschule, arrived at Reykjavik, Iceland, from Sylt, by way of the Faroe Islands, in a Dornier Wal flying-boat.

On July 22 he left Reykjavik for the Faroe Islands on the return journey and will call at Edinburgh before returning to Germany.

AN INTERESTING NEWCOMER.

Pinchin Johnson and Co. Ltd., with whom is associated the firm of Robert Ingham Clark and Co. Ltd., both well-known manufacturers of paints and varnishes, have entered the Aircraft Industry with more than the average energy. For some years the allied companies have been experimenting with specialised finishes for aircraft and they have now placed on the market an entirely new preparation known as Britannia Dope.

On July 17 at Stag Lane aerodrome an Avro Avian (D.H. Gipsy engine) which has been acquired by the company was baptised and taken off by Mr. C. G. Heywood, Vice-Chairman of Pinchin Johnson and Co. Ltd., and Major R. H. Ingham Clark, a director of Pinchin Johnson and Co. Ltd., and of Robert Ingham Clark and Co. Ltd. The machine, which has been doped and painted by materials produced by the joint firms, will be flown by Mr. J. Conway Cantrill, Sales Manager and Aviation Representative of Pinchin Johnson and Co. Ltd.

Mr. Cantrill is well known as one of the two voluntary instructors of the Lancashire Aero Club.

After the ceremony Mr. Cantrill took off for Bristol, Gloucester and Yeovil, having already flown from Manchester to London earlier in the day.

The firm is to be commended on its enterprise in acquiring a light aeroplane for the use of its Sales Manager. This practice is becoming increasingly common in the United States, but few firms in this country have yet realised the full value of having an aerial traveller's vehicle.

When the company deals with an aeronautical product an aeroplane becomes doubly useful. Apart from demonstrating in a practical way the firm's products, which in the case of Pinchin Johnson and Co. are dopes, paints, varnishes and cellulose enamels, nearly all of the firm's customers, existing and prospective, possess, or are located near, aerodromes. Therefore in addition to showing the products in actual service, a considerable amount of time is likely to be saved by the company. Pinchin Johnson and Co. Ltd. deserve to succeed in their enterprise.

Mr. Cantrill, Mr. C. G. Heywood and Major R. H. Ingham Clark standing in front of the Avro Avian (D.H. Gipsy engine) which has been acquired by Pinchin Johnson and Co. Ltd. (*"Aeroplane" photograph.*)

AIR MAILS TO SPAIN AND PORTUGAL.

The Postmaster-General announces that correspondence (except parcels) for Spain and Portugal may now be accepted under the usual conditions for despatch by air to Bordeaux and onward transmission by train, thus gaining about a day over the ordinary route. The new service leaves London three times a week, on Tuesday, Thursday and Saturday, and the latest time of posting at the General Post Office, London, is 7.30 a.m.

An air fee of 2d. per ounce in addition to the ordinary postage is charged for this service.

WELCOMING THEM IN.

On Wednesday, July 17, the Anglo-American Oil Co. Ltd. gave a lunch at Olympia to welcome Mr. Kingsford Smith and his companions to England, whither they had flown on their Fokker monoplane Southern Cross, using Pratt's petrol.

Mr. Francis Powell, the chairman of the "Anglo," enumerated the various great flights already made by the Southern Cross, and said that the flight across the Pacific was one of the greatest feats of airmanship yet performed. He also paid a tribute to a number of outstanding personalities in the aeronautical community who were present.

Mr. Kingsford Smith acknowledged the help of his companions on the big flights, and stated that it was extremely probable that he would attempt an Atlantic flight on the Southern Cross in the near future.

He said that he had come over here to test some new all-British Avro 10 monoplanes which he had bought for the Air Line in which he is interested in Australia.

Mr. Ulm, who has accompanied Mr. Kingsford Smith in the voyages of the Southern Cross, then made a speech, but one is unable to report it, as it was inaudible.

The Chairman, in closing, paid a tribute to those who had lost their lives when searching for the Southern Cross when it was lost earlier in the year.—G. D.

AVIANS IN SOUTH AFRICA.

The Survey Department of the Tanganyika Government has acquired an Avro Avian IIIa (Cirrus II engine). This machine is fitted with a special camera and will be flown by the Director of Surveys, who is also Territorial Representative of the Aero Club of East Africa in Tanganyika.

The Rhodesian Aviation Co. Ltd., of Bulawayo, has bought an Avro Avian IV (Cirrus-Hermes engine) from Aeros (Pty.) Ltd., of Johannesburg, the local Avian agents, and this machine has been flown to Bulawayo by Mr. Roxborough Smith.

A DURABLE FINISH.

There is interest in noting in connection with the flight of the *Southern Cross* from Australia to England that the wings of the machine were treated with Permanoid Silver Paint, made by Lewis Berger and Sons Ltd., of Homerton, London, E.9.

In spite of the gruelling conditions through which these wings had passed, including continued exposure and sudden changes of temperature, examination at Croydon showed the paint to be in perfect condition.

Louis Berger and Sons, Ltd., are manufacturers of all kinds of paints, enamels, varnishes, lacquers and distempers of the highest class. Their Proxcelin finish was used on the *Golden Arrow*, which holds the World's Automobile Speed Record.

NEW COMPANIES.

AIRCRAFT INVESTMENT CORPORATION.—The Aircraft Investment Corporation Ltd. was registered as a "public" company on July 17, with a nominal capital of £400,000 in £1 shares. The objects are to acquire and hold shares, stocks, debentures, debenture stocks, bonds, obligations and securities; to buy, hire, build or acquire airships, aeroplanes, seaplanes, flying-boats, helicopters, ships, barges and air, sea and other craft, to carry on the business of managers of aerodromes, seaplane bases, motor services and shipping property, carriers, forwarding agents, woodworkers, manufacturers of fabrics, plywood and all forms of ply construction and cements, solutions and varnishes; to engage in the development and consolidation of the industry of aviation and of aeronautics; to support and finance persons and companies engaged therein, to instruct persons in the control, navigation and management of aircraft, to conduct aeronautical and aviation meetings and exhibitions, etc. The subscribers (each with one share) are: C. H. G. Millis, D. C. Tewson, F. J. W. Gurney, G. F. Shipman, E. M. Leslie, C. W. Foster and E. G. A. Jones, all solicitors, of 18 Austin Friars, E.C. Solicitors: Slaughter and May, 18, Austin Friars, E.C.2.

POPULAR FLIGHTS LTD.—Private company. Registered July 1[illegible]. Capital, £100 in £1 shares. Objects: To adopt an agreement with G. S. Hewitt, to provide facilities for the transport of passengers and goods by air, land and water, whether for pleasure purposes or otherwise, and for the instruction of persons in air navigation, motor driving and motor boating, etc. The first directors (to number not less than 2 nor more than 6) are: G. S. Hewitt, 22, Washington House, Basil Street, S.W.1, gent. P. H. Davies, 20, Penge Road, S.E. 25. Miss V. E. T. Latham, 20, Sunset Avenue, Woodford Green. Qualification £1. Remuneration: As fixed by the company. Secretary: Miss V. Latham. Solicitors: Walter, Burgis and Co., 31, Budge Row, E.C.

PERSONAL NOTICES.

DEATHS.

BENNETT.—On July 19, at Boreham Wood, Herts, as the result of a flying accident, Walter Patrick Dillon Bennett, Plt. Off., Reserve Air Force Officers.

BUTTENSHAW.—On July 17, at Skipsea, as the result of a flying accident, L-AC. Edward William Buttenshaw, R.A.F.

PRINCE.—On July 17, at Skipsea, as the result of a flying accident, Stanley Frank Prince, Flg. Off., R.A.F.

Mr. Prince entered the R.A.F. with a short service commission in July, 1925. After a course of training at No. 2 Flying Training School, Digby, he was posted to No. 207 (Bomber) Squadron.

MARRIAGES.

BARTLETT—NICHOLL.—On July 20, in London, Robert, only son of Mr. and Mrs. Arthur Bartlett, of 79, Redcliffe Gardens, to Peggy, widow of Lieut.-Col. Vincent Nicholl, D.S.O., D.S.C.

TRACE—JOHNSON.—On June 17, at Salisbury Cathedral, Southern Rhodesia, Garth Newbon Trace, D.F.C., F.R.G.S., Acting Manager of the Aircraft Operating Company's African Expedition, to Doris Mary, only daughter of Lt.-Col. H. H. Johnson, D.S.O., and Mrs. Johnson, of Sheffield and Salisbury, Southern Rhodesia.

BIRTHS.

BARRETT.—On July 16, at Wei-hai-Wei, to Grace (*née* Robertson), wife of R. H. Barrett, R.N., Flg. Off., R.A.F.—a son.

BROWN.—At River Brae, Bellingham, Northumberland, to Edith, wife of Flt. Lt. T. W. S. Brown, R.A.F.—a son.

GLASPER.—On July 4, at Parkstone Nursing Home, Wembley, to Mrs., wife of Flt. Lt. W. A. Glasper, R.A.F.—a daughter.

PER "ACCURACY" AD ASTRA

AIRCRAFT INSTRUMENT MANUFACTURE and REPAIR

is a highly specialised industry, in which it is essential that craftsmanship and science should be allied, if the extreme limits of accuracy demanded by the Air Ministry—in the interests of human safety—are to be obtained.

We only employ specialists; and our Works are equipped with the most modern plant, machinery and scientific Test Apparatus. This enables us to turn out first-class work at reasonable cost, and to guarantee our deliveries to time specified.

REPAIRS carried out, to Air Ministry Specification, to any make or type of Aircraft instrument promptly, and at a very reasonable cost.

Advertisement Offices: 175, Piccadilly, London, W.1. Telephone: Gerrard 6023.
Accounts relating to Publishing and Advertising should be sent to the Offices of Aeronautics Ltd., Cannon House, Pilgrim Street, Ludgate Circus, E.C.4. Telephone. Central 5822.
Subscription Rates, post free: Home 3 months, 7s. 6d.; 6 months, 15s.; 12 months, 30s. Abroad, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8.50. Entered as second class matter at the New York (N.Y.) Post Office.

ON THE AERO SHOW—II.

On behalf of the British Aircraft Industry one tenders humble, if not particularly sincere, apologies to the Press for the hard things said to it by Lord Thomson at the Banquet to our foreign guests on July 18, and written about it in THE AEROPLANE afterwards, on the subject of the lack of publicity given to the Aero Show. The fact has now been disclosed that the British Aircraft Industry as a whole did not want itself or the Show advertised to the mere common people.

Early in the first week of the Show a few of the leading men in the Aircraft Industry, men with active and progressive minds, protested against closing the Show at 9 p.m. and suggested that it should be kept open till at least 10 o'clock. Consequently the Show Management (not till the following Monday, mark you) sent round a notice to each Stand in the Show asking the Stand-holder whether he agreed to this proposition An overwhelming majority voted in favour of continuing to close the Show at nine.

Thus there is no disputing the fact that the majority of exhibitors at Olympia, who definitely included the whole of the British Aircraft Industry, did not care one little bit whether the great British Public came to see the Show or did not. For, perfectly obviously, if the great British Public were to be allowed to see the Show at all they could only see it after leaving work in the evening. And, as was said in this paper last week, very few people who leave work at six could get to the Show before eight, and obviously they were not going to the Show at eight if they were going to be thrown out again at nine.

In common justice to the more progressive firms, especially those who make light aeroplanes and those who cater for civil aviation, and those who are concerned with operating aircraft, one must say that they were in the first place amazed at the closing of the Show at nine and were thoroughly disgusted at the decision of the majority of the Trade. Before the end of the Show they were heartily fed up with standing around doing very little that was worth while from ten in the morning till after lunch, and then having to shut down just when they might have been preaching the Gospel of Airmindedness to the British Public.

BUSINESSLIKE HOURS.

If the hours of opening had been left to this progressive minority the Show would have opened at mid-day and would have been kept open till eleven at night. Then the people of leisure who are interested in flying, or who at any rate are curious about it, would have come in during the afternoon. And the private-owner class, together with foreign visitors who are interested in war machines would have had plenty of time to see all they wanted to see

Then in the evening the people who could not afford to leave their work, or who do not consider aviation as yet important enough to justify them in giving up an afternoon's work, would have come in after dinner. And with them would have come tens of thousands of intelligent people who likewise have to work for their livings but cannot hope to own aeroplanes.

These tens of thousands are the people who evidently were regarded by the British Aircraft Trade as being of no importance. But the said Trade obviously has not the intelligence to understand that these are the people who ultimately influence the buying of aeroplanes.

The great firms who are concerned with war machines realise the importance of thus influencing the working-classes,—whether they happen to wear black coats or overalls, and whether they work for a couple of thousand pounds a year or for thirty shillings a week,—because they are the people who vote for or against adequate air armaments. But there are other firms, some perhaps make aeroplanes but probably the majority are makers of material and accessories and components and so forth, who have not the intelligence to realise this essential fact and are content to conduct their business by creeping up the back stairs and passages of the Air Ministry to tout for business from Technical and Contracts Departments.

They are the majority who voted for early closing.

THE RAG-TAG AND BOB-TAIL.

Firms of that sort were only in the Show because all their big customers, the aircraft-constructing firms, were there and because some of their competitors were there and they could not afford to be out of it.

Possibly they hoped that the fact of their having a Stand at the Show might be accounted unto them for righteousness, seeing that the Air Ministry itself spent such an immense amount of time and trouble in putting up that extraordinarily fine show by the Aeronautical Inspection Directorate and by the Meteorological Department, and that illuminating historical display of models. Also perhaps they hoped that they might get orders for material or gadgets from representatives of foreign Governments. But they were not really interested in the Show as a business proposition, and least of all were they interested in preaching the Gospel of Aviation to the British Public.

Thus the intelligent minority in the Trade was out-voted by the rag-tag and bob-tail of hangers-on,—and, as so often

PRACTICAL INTEREST.—A party of foremen from the Bristol Works on the firm's stand at Olympia.—Showing how one firm, at any rate, encouraged the people who did the work to see the results of their industry.

Digitized by Google

happens, the tail wagged the dog. In a way it serves us right, for after all the Show Committee were the people who in the first instance had the fixing of the closing hour, and they ought to have had the common sense to see that even though most of the Trade are primarily concerned with the making of war-machines the interest of the working classes whether highly or lowly paid was worth attracting.

MUZZLING THE OX.

One of the most lamentable effects of this foolish closing-hour was that the very men who built the Show machines never had a chance of seeing them in Olympia, or of comparing them with the products of their competitors,—for the workmen of the aircraft factories could not, obviously, get to the Show in time to see anything properly. And so the Trade committed the unforgivable sin of muzzling the ox which treadeth out the corn.

Naturally, every manufacturer with any sense gave the staff of his drawing-office time off to go to the Show to improve their knowledge. And naturally foremen and engineers were likewise allowed to go in the firm's time. But, equally naturally, bench-hands and machine-hands could not be spared during working hours,—and outside working hours they could not get to the Show in time to see anything.

In its own little way THE AEROPLANE did its best to promote airmindedness,—for sixty people in the printing works were given tickets for the Show, so that they might go and see in concrete form the machines about which they have been setting type and running printing-presses for so many years. Our printers have been having a terrible time for the past four or five weeks with our big special issues. They have been working practically day and night, and are now thoroughly worn out. But, such is their keenness, that they sacrificed their Saturday afternoons to go and see the Show, —whereas, if reasonable hours had been kept at Olympia they could have gone on week-day evenings when the rush of Press-days was done.

In a speech last February His Royal Highness the Prince of Wales asked "Is the salesmanship of this country up to the workmanship of the men?" Quite definitely the answer is in the negative.

The salesmen at Olympia were excellent. Our American visitors all commented on how well our stand-attendants knew their subject and how well they described their machines. One young woman from New Zealand, a friend of a member of the staff of THE AEROPLANE, said how much she was impressed by the trouble everybody took to show her all over their aircraft, although she was obviously not a buyer.—And this trouble may be well repaid some day,—for her family happen to have considerable wealth and interest.

But what on earth is the good of having first-class goods and first-class individual salesmen if the heads of firms collectively are so utterly fatuous and futile as to prevent the Public, who will ultimately buy, or will influence buying, from seeing either the goods which are for sale or the men who are appointed to sell them? And, when the men in the factories realise, as they do, how the Trade collectively is mismanaged, how can we expect them to be enthusiastic?

Individually, certain firms in the British Aircraft Industry have on their staffs some of the finest salesmen in the World. Collectively the British Aircraft Industry has not shown enough salesmanship to justify it in trying to sell ice to Judas Iscariot.

THE PRESS AND THE TRADE.

However, as the Trade evidently did not think that the interest of the working classes was worth attracting they cannot blame the Press for practically ignoring the Show.

Furthermore, to be fair to certain papers, one must say that they have done the Show very well. *The Times*, representing as it does all that is best in the British character and in journalism, has published articles on the Show day after day,—hardly ever less than a column in length, and on occasion rising to two columns. And, as always in *The Times*, those articles have been thoroughly sound, absolutely accurate and very readable.

They have attracted to the Show quite large numbers of the best people in the country. And probably more of those best people would have gone to the Show if the appeals of *The Times* had been backed by the persuasion of sons and daughters, nephews and nieces who read the cheaper papers but unfortunately have to work for their livings and could not get to the Show owing to the absurd closing time.

The more popular papers also did their part, so far as they were able, when they were provided with anything of the kind which seemed to them of heart-interest.

For example, when National Flying Services started that brilliant idea of holding a competition on the Reid Aptitude Indicator, with free tuition at Hanworth as a prize for one man and one woman, the popular papers took it up quite strongly. And quite a number of people managed to struggle away from their businesses in time to compete.

THE APTITUDE COMPETITION.

Incidentally, the results of these competitions are uncommonly interesting. The best man on the Reid Indicator turned out to have been an air mechanic in the R.F.C during the War, who had flown as an observer but had never had the chance of becoming a pilot. And the best woman turned out to be a winner of ski-ing competitions.

By the end of the Show the latter had done two hours

WHAT YE WENT OUT FOR TO SEE.—A general view of the

Digitized by Google

dual-control instruction and looked like being sent flying solus (or rather sola) with very little further instruction. The mere man, a thorough sportsman, has taken a week of his Summer holiday so as to get in his instruction.

The keenness of people to take part in these competitions is an indication of what may be expected when the British Public are graciously allowed by the Aircraft Trade to take an active interest in flying.

Even the offer by National Flying Services of a trial lesson at two guineas a head, although in itself it is only what any school of flying would give, was taken up by the popular papers and attracted a great many customers.

TIME AND TEMPERATURE.

The first Saturday afternoon of the Show, in spite of the intense heat, people flocked to Olympia in crowds. And on the closing day there was quite a goodly crowd, although by that time the papers had quite justifiably lost interest.

Apart altogether from this idiotic mistake in the closing hour, the holding of the Show in July was in itself a mistake. If we had by sheer good luck struck a patch of cold, wet weather, which is unusual in July, certainly there would have been more people in Olympia during the day, because a certain number of the idle rich, or those who are unemployed on a modest income, or who are taking holidays, or can afford to take a day off when they want to, would have come into Olympia out of the wet instead of going to the seaside or up the river.

After all, those people are not really as important to the Aircraft Trade, and to the support of an adequate Air Force, as are the honest working people like ourselves. But to that extent the number who came to Olympia under existing conditions might have been larger if the fortnight had been wet.

WHEN THE SHOW SHOULD BE.

There is, however, a still more important reason why the Show ought to be held as late in the year as possible. That reason is that flying in this country is essentially a seasonal pastime, or occupation.

A couple of months before the Show one of the leading makers of light aeroplanes said that there had been a distinct falling off in orders, because would-be buyers of aeroplanes were waiting for the Show before deciding what to buy. Also, the Show stirred up an unnatural activity inside the aeronautical community itself just at the time of the year when aviation would be at its maximum of activity in any case.

Therefore the obvious thing to do is to hold the Show and stir up activity among the aeronautical people at a time of year when normally air affairs would be at their flattest.

Certainly the Show should be held at a time of year when there is a chance of some decent weather so that people who are interested in certain aeroplanes in the Show have a chance of going out to an aerodrome to see those same machines fly. Therefore November, December, January and February may be barred.

October would be a good time for the Show in a way, because by then people are back from their Summer holidays and, except for those who go away for the shooting, there is no particular attraction to keep people out of doors. But by October all the new types of machines that are coming out during the Summer have been flown and seen, and therefore there would be nothing very much fresh to put into the Show.

Actually March would be a much the best month. During the previous four months, when there is not very much flying except by enthusiasts and those who have to fly because they are in a hurry, firms could be working away on new designs and new types. Such new machines could be flown experimentally perfectly well during the Winter months, though there would be very little inducement for private owners to buy them. But when they appeared in the Show they would be properly tested, flyable machines, and buyers would not have to carry out experiments at their expense for the benefit of the manufacturers.

The prospects of the Show in March, the publication of projected designs or photographs of machines in their trial stages and so forth, would keep interest going among prospective buyers. And when the Show opened people would rush to look at the new machines with all the pent-up enthusiasm of the Winter instead of dragging themselves by a mental effort to a Show in the hottest part of the year to look at things most of which they have already seen flying or have actually flown. Thus the Show in March would mark the bursting forth of a new season in aviation.

THE QUESTION OF PLACE.

Probably the chief objection to a Show in March is that Olympia has already been let for the whole of March years ahead for an exhibition of Idle Homes, or Confectionery and Sticky Stuffs, or something of that sort, which is much more important than aviation. And there certainly is some difficulty in finding in London itself an exhibition building big enough to hold aircraft.

The Society of Motor Manufacturers and Traders is, one believes, tied up to Olympia by holding a large number of the shares in the company which owns Olympia. And apparently the Society of British Aircraft Constructors is tied up to the Society of Motor Manufacturers and Traders because some of the firms in the S.B.A.C. happen to be hooked

from the Gallery over Addison Road Entrance.

Digitized by Google

up with the Motor Trade and are also members of the S.M.M. and T.

This has always been one of the troubles of the Aircraft Trade, because, though the motor firms which are interested in aircraft are singularly progressive, the Motor Trade, as a whole, is about the least progressive and the least intelligent of any British industry, with the possible exception of the Iron and Steel Trade.

If the S.B.A.C. could only cut itself loose from the Motor Trade and could find the money, either within itself or through some speculative capitalist, to buy the old Earl's Court Exhibition site and put up a first-class exhibition hall of its own, it would not only be able to hold its own exhibition at the right time of the year, and do the thing properly, but it would certainly make a very fine profit out of letting the exhibition buildings at other times of the year.

Olympia is a difficult place to reach anyhow, because the Tubes do not go anywhere near it, and the railway service to Addison Road is thoroughly inadequate, and the 'bus services down that road are overcrowded anyhow. On the other hand, Earl's Court can be reached from anywhere, either from the City or from the West End, or from the Western suburbs, or from anywhere on the Inner Circle, quicker than any place within the same distance of the middle of London. Why that site has lain idle so long is a mystery.

LOOK AHEAD.

One is discussing this question at considerable length now because if Civil Aviation develops as it seems to be developing we *must* have an exhibition of civil aircraft somewhere within two years of this date.

We can hardly expect to have a Show in 1930, but we certainly ought to have one in March 1931. And if the firms who are solely interested in war machines are not prepared to back an exhibition in March 1931 then the firms which are interested in civil aircraft and all these young firms which are springing up to build civil aircraft ought to hold a show of their own.

Some of them are possibly held down by that bond with the S.M.M. and T., which ties exhibitors at Olympia not to show anywhere else. But if they are going to make a success of the Aircraft Trade then they will find that the best thing they can do is to cut loose from the bond. At this recent Show civil aircraft were in the minority and of the civil aircraft the majority were intended for private owners and were not actually commercial aircraft.

OUR COMMERCIAL MACHINES.

One shrewd American visitor remarked that this was the finest exhibition of war machines that had ever been held in the World. And in spite of the League of Nations and Pacifism generally, that was a perfectly true statement.

Nothing has yet been produced in any country to touch certain of our new single-seat fighters and two-seat fighters. And certainly no other country in the World has anything to equal our big flying-boats, which were shown bristling with gun-rings and bomb-racks.

Our American friend added: "There are only three commercial machines in the Show. One of them is American and the other two are Dutch."

He referred to the Ford Tri-Motor, and to those two fascinating machines on the Armstrong-Whitworth-Avro Stand, one of which was built definitely to Fokker design and the other to what our American friend called a pantograph diminishment of it. This last statement was not strictly true, because the small tri-motor Avro, though built on Fokker lines and on Fokker principles, is entirely Avro in detail design.

In other respects his statement is not quite accurate, because such machines as the Westland IV and the Moths and the Avians and the Bluebirds can under suitable conditions be operated as commercial machines and not entirely as sport machines. Also, the Blackburn Nile is primarily intended for commercial work, and the Short Singapore, though shown with bombs and gun-racks, would make either a high-speed air-liner or mail-boat, or a very pleasing private yacht,—albeit for a millionaire.

Nevertheless, on the whole his phrase was a very good summing up of the situation. The Show was primarily a show of war machines, and the commercial element was comparatively a minor consideration.

But British aviation is not going to run on those lines for very long. If our more progressive firms who are taking Civil Aviation seriously will only send their representatives out into the British Dominions, and will get the market there with the types of machines which are wanted, and will do it before over-production in America starts the American Aircraft Trade dumping surplus stock into the British Dominions, our output of civil aircraft, both sport and commercial, will soon be very much greater than our output of war machines.

And if we are going to get that market, and are going to build up our home market for machines, either for private owners or for business men who want to hurry round the British Isles or round the Continent of Europe, we must have our properly organised shows of civil aircraft.

DO IT NOW.

Therefore one makes the suggestion quite seriously that those firms which are wide awake enough to see the immense possibilities of Civil Aviation should get together forthwith and discuss right now the right time and the right place for the next Aero Show in London. And one suggests that March 1931 is the right time for it.

If the question of the next Show be left to the makers of war machines and to the people who are tied down by the S.M.M. and T., and to the various and sundry makers of material and components and accessories and gadgets who voted against keeping the Show open for the benefit of the great British Public, we shall probably have to wait another nine years for the next Show, as we have waited since the last Show.

But if the people who are making civil aircraft decide to hold a Show of genuinely commercial machines about March 1931 we shall then find ourselves with plenty of civil machines which are well worthy of the high reputation built up for British aircraft by the makers of war machines and the makers of civil machines alike. And we shall have a goodly number of prospective buyers in this country, besides all those who are attracted from foreign countries and from our own Dominions Overseas. And when we decide to hold that Show let us hope that the promoters will realise that an Aero Show, like a theatrical show or any other show should be open during those hours of the day when people can come and see it.—C. G. G.

URSUS, THE BEAR.—The A.N.T.-5, a Russian-built cabin monoplane (three Gnôme-Rhône Titan engines), belonging to the Soviet Government. Piloted by M. Gromoff, it is making a flying tour of Europe.. It is shown above at the Littorio Airport, Rome. Eleven passengers are being carried, including M. Sarsar, the Chief of the Civil Red Air Fleet, MM. Podogin and Klewzoff, directors of the Dobrolot and Osoaviachim air transport companies, and a number of Russian journalists. It crashed in France on its way to London. Those who believe that URSS comes in peace will do well to remember Kipling's poem with the refrain, "Make not your peace with Adam-Zad, the bear that walks like a man."

Deeds — —

The following achievements prove the amazing efficiency of every Napier aero engine.

SPEED: The highest speed ever attained in the air was achieved by Flight-Lieut. D'Arcy Greig, flying a Supermarine-Napier seaplane—speed 319.5 m.p.h. This same machine, piloted by Flight-Lieut. Webster, won the Schneider Trophy in 1927. The engine was a NAPIER.

RELIABILITY: The greatest reliability flight ever accomplished was carried out with NAPIER engines. Four Supermarine-Napier flying boats flying in formation flew from England to Australia and back to Singapore—180,800 engine miles without mechanical trouble.

ENDURANCE: The first non-stop flight from England to India was carried out with a Fairey monoplane, fitted with NAPIER engine, piloted by Squadron-Leader A. G. Jones-Williams, M.C., and Flight-Lieut. N. H. Jenkins, O.B.E., D.F.C., D.S.M. A distance of 4,130 miles was covered in 50 hrs. 38 mins.

THE ROYAL AERONAUTICAL SOCIETY CONVERSAZIONE, AND THE WILBUR WRIGHT MEMORIAL LECTURE.

The Conversazione given by the Royal Aeronautical Society on Thursday, July 25, at the Science Museum at South Kensington, was an excellent affair of its kind. Before the conversazione a number of our more notable visitors were entertained to dinner by the Council of the Society, —the guest of the evening being the Hon. W. P. McCracken, Junior, who was to deliver the Wilbur Wright Memorial Lecture in the course of the evening.

The guests were graciously received on their arrival by the Honourable Mrs. Forbes-Sempill.

When the dinner-party had joined the rest of the guests Col. the Master of Sempill proceeded to present various awards to members of the Royal Aeronautical Society.

The Sir Charles Wakefield Gold Medal was awarded to Mr. H. B. Irving, of the N.P.L., for work on slots and controls: The Simms Medal was awarded to Mr. H. Sutton, of the R.A.E., for a paper on Corrosion of Light Alloys: The Taylor Medal was awarded to Prof. Melvill Jones, of Cambridge, for a paper on the Streamline Aeroplane: And the Busk Memorial Prize was awarded to Mr. W. G. Farren, of Cambridge, for his paper on Monoplanes and Biplanes.

Colonel Sempill then introduced Mr. McCracken in a few well-chosen words, reminding us that he spoke on hallowed ground, seeing that over his head was the original Wright Biplane on which the first flight in the world had been made, in December, 1907.

Col. Sempill also pointed out the original Blériot monoplane in which M. Blériot had flown the Channel for the first time on that day 20 years ago, and remarked that we were fortunate in having the machine there, because a few days after it had been despatched to England the idea suddenly occurred to the French authorities that they would like to have it at a Blériot Celebration themselves. When the French authorities asked for it from the museum in which it normally reposes they were told that it had already gone.

Mr. McCracken then gave the Wilbur Wright Lecture.

This was in fact a very fine effort on his part, because the request that he should deliver the lecture was only sent to him by wireless while he was on his way from America to this country a few days before the opening of the Aero Show. In the intervening time he had composed a notable paper and had secured for it a number of interesting diagrams and kinematograph films. When he came to deliver the lecture he found himself, as indicated, underneath the Wright aeroplane, and, backed by a Union Jack plus a large amount of red cloth, and without any means of displaying either the lantern slides of the diagrams or the movie films. Consequently he had to reduce to words the figures which should have been displayed.

In spite of these drawbacks the lecture was of absorbing interest and contained masses of interesting information about the development of Civil Aviation in the States.

THE WILBUR WRIGHT MEMORIAL LECTURE, 1929.

Science In Relation to Regulating and Promoting Civil Aviation.

The paper read as follows:—

During the past quarter of a century great strides have been made in perfecting the science of aviation. Too much credit cannot be given to the men who have laboured untiringly in the laboratories in an endeavour to determine with mathematical certainty the physical laws that govern the mechanical devices which mankind is using in his conquest of the air.

Science has done more for civil aviation, however, than unravel the mysteries of aerodynamics and internal combustion engines. It has provided many important aids to air navigation, such as improved lighting facilities for airways and airports, wireless as a means of communication between ground and aeroplane, and also as a beacon to guide the pilot on his course, and numerous instruments now adorn the cockpit of every aeroplane.

While at times the development of air transport may suffer because of lack of co-ordination between the laboratory and the factory, it will suffer far more should a similar condition exist between the scientists and those charged with the duty of regulating and promoting civil aviation.

It would seem that there are five fundamental factors which are controlling in the development of any form of transportation. These are: Safety, speed, reliability, cost and comfort. While opinion may differ as to the relative importance of these factors, it is not essential that this question should be solved. They are far from being separate and apart from each other. In fact, they are so interwoven that it is impossible to deal with one without in some degree affecting the others. They are not mentioned as a list of sub-headings, but rather that they may be borne in mind throughout this paper. They are the weather-vanes that indicate to scientists, manufacturers, financiers, operators, insurers, Government officials, and the general public alike, the progress which civil aviation is making. Each of these groups may either, by their action or inaction, materially affect the development of civil aviation.

In presenting one's views on such a subject as this, it seems advisable to draw primarily on one's own experience. Therefore, you will pardon me if I approach the subject from the point of view of what has taken place in the United States during the past few years. Also may I direct your attention at the outset to the fact that I am not an engineer nor a graduate of a technical school? This will no doubt be obvious before long, but there is no reason for concealing it, even in the beginning.

The Air Commerce Act, which constitutes the legal basis for the promotion and regulation of aviation in the United States, was approved May 20, 1926. It vested in the Secretary of Commerce power by regulation to provide for the licensing of aircraft and airmen, the establishment of air traffic rules and the rating of airports. Only aircraft and airmen engaged in inter-State and foreign commerce, as defined by the Act, were required to secure these licences, but others were at liberty to apply for them if they chose to do so. The air traffic rules, however, were made applicable to all those engaged in flying in the United States and its territorial possessions, except aircraft belonging to the national defence forces when operating over their own aerodromes or upon tactical missions.

The Act also charged the Secretary with the duty of fostering and promoting air commerce, specifying particularly the establishment of civil airways, the erection and maintenance of aids to air navigation other than airports and the exchange with foreign Governments, through existing Governmental channels, of information pertaining to civil air navigation as part of these duties.

THE GROUPING OF SCIENTISTS.

When this Act was passed there were five distinct groups of scientists dealing with aeronautical problems. There was one group in the Industry, another in educational institutions, a third composed of the technicians in the national defence forces, a fourth in the Government service known as the Bureau of Standards, which is an integral part of the Department of Commerce, and the fifth likewise in the Government service, but under the jurisdiction and control of a committee composed of representatives from the other four groups, and known as the National Advisory Committee for Aeronautics.

Under such circumstances, it is obvious that there was no occasion to create another purely scientific agency to assist in carrying out the provisions of the law. In fact, one of the controlling reasons for assigning these new functions to the Department of Commerce was that there were already in that department at least four bureaux which could logically be expected to assist in carrying out the duties prescribed by the Act.

ALL-ROUND EXCELLENCE OF MOTH ENDORSED AT HESTON

INTERNATIONAL AEROBATIC CONTEST

Aerobatics test the qualities of a machine in all departments —speed, climb, manoeuvrability and general robustness. The International Aerobatic Contest, organised by the Royal Aero Club, on July 20th at Heston Air Port, was won by Captain H. S. Broad, A.F.C., flying a Gipsy Moth. Mr. G. Murray, also on a Moth, took second prize. Inverted flying figured largely in Captain Broad's programme which provided a convincing demonstration of the Moth's all-round strength of construction.

These were the Lighthouse Bureau, to which was assigned air navigation facilities; the Bureau of Standards, to which was assigned research problems, engine testing and similar duties; the Coast and Geodetic Survey, which now makes our aeronautical maps; and the Bureau of Foreign and Domestic Commerce, which is promoting foreign trade in aircraft. Two new divisions have been created, one known as the Air Regulations Division and the other as the Airports and Aeronautic Information Division. The aeronautical divisions of these four older bureaux and the two new divisions constitute what is known as the Aeronautics Branch of the department.

The two most important problems at the outset were the promulgation of regulations and the establishment of aids to air navigation.

Over six months were spent in the preparation of the regulations. During this period the experience of other nations in dealing with this subject as carefully studied.

A preliminary draft of the regulations was prepared and submitted for criticisms to representatives of the aviation personnel of the Army, Navy, Post Office Department and the National Advisory Committee for Aeronautics. The draft was revised in the light of these criticisms and was then submitted to the manufacturers, operators, insurance underwriters and other similar groups interested in aviation. They were invited to submit written criticisms and also to attend group meetings held under the auspices of the department. All sections of the proposed regulations were submitted for discussion at each of the group meetings.

At the conclusion of these meetings the draft was revised and circulated to all those who attended any of the group conferences or had submitted written criticisms, with the request that if they had any further comments to make they submit them in writing. Then followed the final revision and the original regulations became effective on Dec. 31, 1926. At each of the group conferences there were one or more men who could be classified primarily as scientists, and underlying all the discussions were the same five fundamental factors of safety, speed, reliability, cost and comfort.

Each year since the regulations were promulgated, the department has had an annual conference open to all interested in aviation. These have been very well attended by representatives of all the various groups having occasion to deal with the department on aeronautical matters. While the principal subject of discussion has been proposed amendments to the Air Commerce Regulations, an opportunity has been afforded to discuss every phase of the department's aeronautical activities. Many special conferences have also been held dealing with such subjects as materials for landing strips, fire prevention in hangars, and the like. It is important not only that there should be the closest co-operation between scientists and the regulatory authorities, but also between the industry and Government officials.

To one of royal station rather than of scientific trend of mind is attributed the saying that "the test of the pudding is in the eating." While it would be arrogant indeed to attribute to the regulations themselves, to the manner of their enforcement, or to the combined activities of the department, the progress which has so recently been achieved in civil aviation in the United States, nevertheless, they have had sufficient bearing upon that progress to warrant referring to them in connection with what has transpired.

Before doing so, however, it might be well to point out that wherever possible pilots have been employed to do aviation work in the department. This applies to office as well as field positions. Naturally all the inspectors are pilots, as are the airway extension superintendents. Even the clerical and stenographic personnel have been afforded opportunities to fly if they cared to do so. We want them to be not only air-minded, but air-wise.

How It Was In the Beginning.

There had been some activity in civil aviation during the year 1926, in reliance upon the promise of the administration and the responsible leaders in Congress, that a definite federal aviation policy, as later set forth in the Air Commerce Act, would be adopted. Therefore, in order properly to present the picture, it is fair to make a comparison beginning with the 1st of January, 1926.

At that time almost all the aircraft in civilian hands consisted of war surplus training planes which had been adapted to various civilian uses. There were a few manufacturers of civil aircraft who were building a limited quantity of new models, largely along the lines of military training planes, and in almost every instance without the aid of any real scientific engineering staff. These planes were for the most part powered with war surplus engines and their use was confined to carrying passengers on short flights, instructing a few students, a limited amount of aerial photography, crop dusting, and aerial taxying.

The only scheduled flying was done by the Post Office Department, which had established an airway from New York to San Francisco, a distance of less than 3,000 miles. This airway was lighted from New York to Salt Lake City, a distance of 2,000 miles. There was a single daily schedule in each direction over the entire route, and a day and night schedule between New York and Chicago. The public as a whole took very little interest in the air mail service, and still less in the other forms of civilian aviation.

The advantage of the vast distances in the United States to aeronautical development is quite apparent, but experience has shown that the longest routes are not uniformly the most profitable. The determining factor involves, among other items, the available traffic and cost on the one hand and the speed and reliability of the service on the other.

Naturally, with such a rapid development in air transport one would expect a corresponding increase in the aircraft industry and other aeronautical services. However, the increment in this field has been even greater than in air transport. In 1926 there were 76 aeroplane manufacturers and 11 engine manufacturers. In 1928 the figures were 153 and 48. While all aeroplane manufacturers are included in the total, it should be mentioned that some of them are quite limited as to production and capitalisation.

The attitude of the public towards aviation may be gauged by the increase in the number of miles flown in each year and the number of passengers carried. In 1926 the passengers numbered 5,782 on scheduled lines, and 4,318,087 miles were flown. In 1928, 37,500 passengers were carried, and 11,000,000 miles were flown, on scheduled lines.

Figures for the first six months of 1929 were not available in time to be included on this paper, but more passengers were carried during that half-year than during all of 1928 and the daily average mileage for scheduled operations during the first six months of 1929 was three times what it was for the same period in 1928.

Attention should be called to the fact that 75 per cent of commercial aeroplanes manufactured in 1928 were of the open cockpit type, suitable for accommodating from one to three persons. This equipment is used primarily for civilian training and sport flying.

AN INTERESTING VISITOR.—A Dornier Wal flying-boat piloted by Herr Von Gronau, chief seaplane pilot of the Deutsche Verkehrsfliegerschule, refuelling at Leith during a tour of the North Sea. The boat left Sylt on July 17 and flew to Reykjavik, Iceland, returning to Sylt by way of the Faroe Islands and Leith, where it arrived on July 25. This is the actual boat used by Capt. Amundsen in his 1925 attempt to reach the North Pole and was later used by Mr. F. T. Courtney in his first attempt to fly the Atlantic. After reconditioning it was bought by the Deutsche Verkehrsfliegerschule and used by them for oversea training.

TYPE CERTIFICATES.

The number of approved types certificates issued by the Department in 1928 was 152. This tells a very important story. By way of explanation, may I describe what is involved in securing an approved type certificate for aircraft? Manufacturers must first submit to tthe Air Regulations Division complete plans, specifications and drawings of the aircraft, together with a stress analysis certified by a competent aeronautical engineer. These data are checked by aeronautical engineers in the employ of the Engineering Section. In cases where they do not conform to the safety factors and practices prescribed by our airworthiness requirements, the question is taken up with the engineers for the manufacturer.

Static tests are not required in every instance but will always be accepted, and may be required when the department's and manufacturer's engineers are in disagreement as to the strength of the structure. When these discrepancies, if any, are all satisfactorily adjusted, the application is then referred to the Inspection Section.

This section first sends one of its men to the factory to check up the materials they are using and their shop practices. When specifications, materials and factory are approved, and a plane is built in accordance therewith, it is given what is termed an engineering flight test by one of the department's engineering inspectors. When this test is passed, the certificate is issued.

The manufacturer is then entitled to build planes similar to the one which passed the final engineering flight test, with the assurance that they will be licensed, provided the planes, including workmanship and materials, conform with the approved specifications.

The Government does not keep an inspector continually at the plants, but the plant of a manufacturer holding an approved type certificate is subject to inspection at any time. Frequent factory inspections are made, and if the manufacturer is not complying with the requirements of the department, his certificate may be suspended or revoked.

As regards the manner of testing engines, the department requires that the manufacturers run the preliminary tests at his own factory or at any other place he may select. The final 50-hour test is run by the department at the Bureau of Standards, and constitutes the basis of the h.p. rating and the maximum speed for the propeller setting. In lieu of this test the department will accept test certificates by either the Army or Navy.

METEOROLOGICAL SERVICES.

The Air Commerce Act prescribes that the Secretary of Commerce shall make recommendations to the Secretary for Agriculture as to the necessary meteorological service for aerial navigation. It has required some study to determine just what type of service was necessary. In making these studies we have had the assistance of the meteorological experts in the Weather Bureau, the Army and Navy, a specialist employed by the Daniel Guggenheim Fund for the Promotion of Aeronautics, as well as the members of our own staff. It would be remiss not to mention the recommendations of the operators and their pilots.

All this has resulted in a revised system of aeronautical weather service. The current fiscal year, which began on July 1, 1929, will witness a substantial expansion in this type of service along our airways and particularly in connection with what is known as a secondary network of stations off the airways, but reporting to a central control station on the airway. However, even during this period there has been a marked improvement in the quality of aeronautical weather service with a corresponding reduction in the percentage of accidents due to adverse weather conditions

Here mention is made of the fact that at Dec. 31, 1926, there were 2,041 miles of lighted airways, with 612 beacons and 92 intermediate lighted fields, whereas at Dec. 31, 1929, there were 6,988 miles lighted, with 1,188 beacons, and 210 intermediate lighted fields.

The Department of Commerce furnishes communication facilities for desseminating weather information once it is prepared by the meteorological authorities. For distributing this information wireless, teletype, telephone and telegraph are used.

The teletype has been found particularly useful not only in connection with transmitting weather information, but also other information pertaining to air operations. It consists of a series of typewriters installed at the various airports along a particular route. A message written by an operator at one machine is automatically recorded on a tape by every other machine attached to the circuit. Circuits may be joined together or disconnected by means of a switch board as occasion requires.

The fact that the wireless bands available for aeronautical communications are limited in number requires that they be conserved as far as possible for communicating with aircraft in flight. This makes it necessary to use every practicable means of ground communication for transmitting information from one airport or intermediate landing field to another.

WIRELESS BEACONS.

During 1928 only two wireless beacon stations had been installed, but these demonstrated conclusively the practicability of this particular type of air navigation facility, and the programme for the current year contemplates a substantial extension of this service.

The wireless beacon consists of a mechanically operated station transmitting two or more signals over antennæ set at fixed angles to each other. The mechanical transmitters are so synchronised that three signals are sent out by each pair of transmitters, one on the right of a given course, the other on the left of the given course and by overlapping a dot with a dash a third signal is sent out on the course itself.

In the preliminary stages it was necessary for the pilots or navigators to wear a headphone and to listen constantly for the signals. However, there has now been developed by the aid of scientific research a visual indicator of the vibrating reed type which can be installed in the pilot's cockpit and which automatically informs the pilot whether he is on the given course or to the left or right of it.

INCREASE IN LICENSES.

Another index of the rapid increase in air operation will be found in the number of licences of various kinds which have been applied for and issued.

In 1926 there were none. At the end of 1927 there were 1,027 pilot licences issued and 4,145 applied for against 4,887 and 8,375 at the end of 1928. In 1927 the aircraft licences issued were 681, and applied for 2,823. In 1928 the figures were 3,165 and 6,611.

In 1927 aircraft identification numbers issued were 832, and 908 applied for. In 1928 the figures were 1,939 and 3,031.

In 1927 student permits issued were 545, and 800 applied for. In 1929 the figures were 10,262 and 11,372.

In 1927 temporary licences were granted to 1,227 aircraft. In 1928 the number was 549.

It will be noted that there has been a decrease in the number of temporary licences. These were made necessary by the fact that during the years 1927 and 1928 the applications were received much faster than they could be handled, with the result that it was found expedient to issue temporary licences in order to avoid seriously interfering with commercial aerial operations.

In 1927 mechanics' licences issued were 1,678, and 2,891 were applied for. In 1928 the figures were 4,383 and 6,189.

The air commerce regulations provide for four classes of pilots' licences in addition to student-pilots' licences. However, the fact that a comparatively small number of industrial pilot licences have been issued indicates that there is no further need for continuing this particular classification.

It is particularly noteworthy that the number of transport pilots almost quadrupled between the years 1927 and 1928. It exceeds by 100 per cent. the expansion of the airway mileage during the same period and yet there was a shortage of transport pilots. The most impressive fact, however, is the large number of student pilot permits issued during the year 1928. At the present time there is every indication that a substantial increase will be made during the current year over the figures of last year.

It might be well to give a short explanation with reference to student pilots' permits. These are required only when a student is taking instruction in licensed equipment. In order to secure a student pilot's permit, the applicant must go to a physician designated as an authorised examiner by the Department of Commerce. The student may elect to take the physical examination prescribed for either a private, an industrial, a limited commercial, or a transport pilot's licence. The examiner's fees, which range from $10 to $15 according to the type of examination, are paid by the student. In making application he or she must indicate the school in which enrolled. These permits are valid for one year from the date of issue, but may be renewed at the expiration of that period by passing another physical examination.

AIRWAYS EXPANSION.

The expansion of the airway system was from 8,404 miles in 1927 to 16,667 miles in 1928. This shows what has been accomplished in developing the airway system of the United States, with the exception of the combined air and rail service between the Atlantic and the Pacific coasts.

At the present time the total lighted airways exceeds 10,000 miles in length and the programme for the new fiscal year, when carried into effect, will provide approximately 4,000 additional miles of lighted airways.

During this three-year period there has been a very substantial improvement in the lighting equipment. Originally it consisted of one revolving beacon of two-million candle power every 25 miles with intermediate acetylene flashing beacons at from three to five miles' intervals. The standard

Digitized by Google

equipment to-day consists of one revolving 2,000,000 candle power beacon every 10 miles.

A lens has been inserted in the top of the beacon permitting the stray light to shine upward to serve as a ceiling light. In addition to this, the revolving light has on each side of it two stationary lights of 500,000 candle power which shine in opposite directions up and down the course. These lights flash the number of the beacon in the Morse code when the revolving light is shining off the course.

The lens of the course lights is red for beacons which are not placed at intermediate landing fields and is amber-coloured if the beacon is located at an intermediate landing field. A green lens is used at the airports. The lens of the revolving beacons along the airway is white.

At the base of each beacon is a large concrete arrow pointing along the course. It is flood lighted at night and has painted on it letters identifying the course and the numerals indicating the number of the particular beacon.

This is really a very matter-of-fact description of the accomplishments of these illuminating engineers who have wrestled with this problem. They have also made marked progress in illuminating airports for night operations and equipping the planes themselves with improved landing lights.

In addition to lighting and marking the airways, the Federal Government, with the aid of various civic organisations, has undertaken a campaign to prevail upon municipalities, railroads and corporations to provide airway marking insignias on the roofs of buildings or in public squares, to inform the pilot of his location, compass direction and the direction and distance to the nearest airport.

In order that this work might be done with uniformity to the best possible advantage, a research programme was organised. It was carried out over a considerable period of time and involved the selection of contrasting colours, size and shape of letters, as well as experiments in illumination for night operations.

AIR MAIL INCREASE.

As air mail constitutes the backbone of scheduled airway operations, it is important to show the increase in air mail poundage and mileage during the period under consideration.

In 1926, 810,855 lbs. was carried over 8,264 miles of airline. In 1928, 4,061,481 lbs. were carried, and the mail lines covered 14,156 miles.

In explanation of this increase it should be pointed out that not only have more communities been accorded the benefit of air mail service by the new mileage and its speed and reliability increased, but also that on Aug. 1, 1928, the air mail rates were substantially reduced.

The theory of our contract mail law is that the excess revenue derived from the sale of air mail postage should be paid to the contractors as compensation for the services rendered. However, under the system of awarding contracts by competitive bidding, the rates charged to the Post Office Department were substantially reduced during the latter part of 1927 and the early part of 1928. As it was never contemplated that the Post Office should profit from its air mail service, the law was amended authorising a reduction in the rates charged to aerial postal users.

While it is true that this reduction was of such a substantial nature as to result in a loss to the Post Office Department, the law empowered the Postmaster-General to negotiate for a six-year extension of existing contracts on the basis of a downward revision of the rate of compensation paid to the contractors.

It is believed that the present rate charged can be maintained without involving any greater loss to the Post Office Department than it would sustain if the mails were transported over similar distances by surface carriers. Monthly payments to air mail contractors for the first six months of 1929 were on the basis of more than 500 pounds per month.

Perchance it has occurred to you that so far this discussion has touched very casually upon the part that science has played in promoting and regulating civil aviation. However, science has been defined as "knowledge of principles or facts." It therefore seemed appropriate to give first some of the facts pertaining to the unprecedented expansion in civil aviation which has taken place in the United States.

SAFETY FIRST.

As was indicated at the outset, one of the most important factors in aeronautical development and regulation involves that of safety. The National Advisory Committee for Aeronautics, in co-operation with the representatives from the Army, Navy and Department of Commerce, organised about a year and a half ago a Committee to formulate a uniform method of aircraft accident analysis. All three of these departments had been engaged in accident investigation and analysis, but until this time there has been no attempt at uniformities of terminology or methods which are necessary for a scientific study of the conclusions reached by the investigating authorities.

After several months of careful study on the part of the committee, an aircraft accident analysis form was adopted accompanied by a special report containing definitions of the terms used and an explanation of the method of reporting and analysing aircraft accidents. As copies of the special report have been widely distributed, there is no occasion for going into great details about the report itself. The work of the committee in drafting this analysis form was so thorough and clear that it is possible for any person with a practical knowledge of flying to correctly analyse an accident.

The method of analysis recommended was promptly adopted by the Army Air Corps, Bureau of Aeronautics of the Navy and the Aeronautics Branch of the Department of Commerce. Already it has been of great assistance to us in the department in analysing aircraft accidents with a view to modifying the present Air Commerce Regulations in order to make air transport safer.

ACCIDENT STATISTICS.

The result of this analysis for the six months' period, beginning July 1, 1928, and ending Jan. 1, 1929, was as follows:—

PERSONNEL.—PILOT: Error of Judgment, 12.64%; Poor Technique, 29.80%; Disobedience of Orders, 2.65%; Carelessness or negligence, 10.12%; Miscellaneous, .58%.

55.79% Errors of Pilot.

OTHER PERSONNEL: Supervisory, .50%; Miscellaneous, 1.68%.

2.18% Due to Other Personnel.

57.97% Total Personnel causes.

MATERIEL.—POWER PLANT: Fuel System, 3.78%; Cooling System, .74%; Ignition System, 2.48%; Lubrication System, .30%; Engine Structure, 1.75%; Propellers and Accessories, .56%; Engine Control System, .58%; Miscellaneous, Undetermined, 5.55%.

15.74% Power Plant Failures.

STRUCTURAL: Flight Control System, .29%; Movable Surfaces, .07%; Stabilising Surfaces, Wing, Struts and Bracing, 1.15%; Undercarriage, 1.87%; Wheels, Tyres and Brakes, .85%; Pontoons or boat, Fuselage, Eng. Mount. and Fittings, .07%; Tail Skid Assembly, .14%; Miscellaneous, Undetermined, .03%.

4.47% Structural failures.

HANDLING QUALITIES: .25%.

.25% Handling Qualities.

20.48% Total Materiel Failures.

MISCELLANEOUS: Weather, 4.67%; Darkness, .50%; Airport and Terrain, 3.70%; Other, 3.25%.

12.12% Total Miscellaneous Causes.

UNDETERMINED AND DOUBTFUL: 9.45%.

9.45% Total Undetermined and Doubtful.

100.00% Total.

VITAL STATISTICS.

KIND OF FLYING.—Schedule Flying (Airway), 51; Student Instruction, 65; Experimental, 32; Miscellaneous (Commercial), 191; Miscellaneous (Pleasure), 333.

672 Accidents.

PILOT.—Licensed, 361; Letter of Authority, 86; Unlicensed, 225; Average Age of Pilots, 28.9 Years; With Medical Waiver, 31; Fatal Injury, Class "A," 88; Severe Injury, Class "B," 91; Minor Injury, Class "C," 101; Uninjured, Class "D," 392.

PASSENGER.—Fatal Injury, Class "A," 127; Severe Injury, Class "B," 98; Minor Injury, Class "C," 106; Uninjured, Class "D," 366.

AIRCRAFT.—Licensed, 338; Temporary Number, 209; Not Licensed, 125; Completely Demolished, "A," 287 (Including 26 fires after crash); Complete Overhaul, "B," 159; Major Assembly Repairs, "C," 165; Minor Repairs, "D," 54; Not Damaged, "E," 7.

NATURE OF ACCIDENT.—Class "A," Collision, 6; Class "B," Collision, 60; Class "C," Engine Failure, 37; Class "D," Without Engine Failure, 144; Class "E," Forced Landing, 143; Class "F," Landing Accidents, 139; Class "G," Take Off Accidents, 78; Class "H," Taxying, 17; Class "I," Fires in the Air, 5; Miscellaneous, Class "L," 42; Unknown and Doubtful, "M," 1.

LIGHTER-THAN-AIR CRAFT.—Total number of accidents reported, 672.

This subject of accident analysis is of sufficient importance to warrant a somewhat detailed description of the manner in which it is conducted.

The Air Commerce Act directs the Secretary "to investigate, record and make public the causes of accidents in civil air navigation in the United States." The Air Commerce Regulations require that "every accident in the operation of licensed aircraft which results in injury to the aircraft shall be reported without delay." They also provide that "when serious injury to personnel or property is suffered or death results a report shall be made by telegraph."

When the accident is a minor one, resulting in no serious damage to the plane nor injury to persons, the report of the

owner may be submitted to the Accident Board without being investigated by one of the department's inspectors. However, if the plane is seriously damaged, or any injury results to pilot or passengers, an inspector of the department is immediately sent to investigate the accident.

As was previously pointed out, all the inspectors in the department are men of extensive experience as aeroplane pilots. They secure the statements of all witnesses, examine the damaged plane, taking specimens of the material and also securing photographs of the wreck and surrounding territory when it is believed that such specimens or photographs would be of assistance to the Crash Board in reaching its conclusions.

The report of the inspector, together with all accompanying exhibits, is then submitted to the Crash Board. This board consists of six members: Two supervising inspectors who are stationed at the headquarters in Washington, the medical director, or in his absence, his assistant, a representative of the Engineering Section, the chief of the Enforcement Section, and the chief statistician. Over half of the members of the Board are qualified pilots and all of them have had considerable experience in aeronautical matters. This board proceeds to determine the causes of the accident and apportion percentages to the various factors involved. In case of disagreement, averages are taken.

The results already quoted represent the opinions of this board. It is interesting to note that 55.79 per cent. of all accidents during the period were charged to "errors of pilots." This clearly indicates that more rigid examinations should be given to applicants for pilots' licences and also that improvements should be made in the training of civilian pilots.

You will recall that the Air Commerce Act requires only aircraft and personnel engaged in inter-State commerce to secure licences. Students' instruction in practically every instance is confined within the borders of a single State. Therefore, at the outset, the department was not in a position to regulate the civilian flying schools other than to provide that of those pilots holding federal licences, only transport pilots could give flying instruction for hire or reward.

However, there was a general demand that the department should have some supervision over the schools. After the facts which have been quoted were made public, the Air Commerce Act was amended so as to authorise the Secretary of Commerce to examine and rate civilian flying schools, provided these schools made an application for such examination and rating. While it is not compulsory under the law that schools have a rating from the department, there is every indication that competition, in conjunction with State legislation, will practically force all of them in the near future to secure such a rating.

The regulations governing the examination and rating of flying schools were promulgated last April and the task of carrying out the mandate of the amendment to the Act is just getting well under way. Sufficient time has not yet elapsed for the results to become apparent, but all are confident that this represents a forward step in making aviation much safer.

The careful analysis of all aircraft accidents of commercial types of aircraft affords an opportunity to determine these factors in the design and operation of aircraft which demand improvement.

As an example, I will take a period of six months, from July to December, 1928, during which time 672 accidents were reported (Chart 12). The accidents to aeroplanes by cause are as follows:—

Collision—full flight—with other aircraft ..	6
Collision with other than aircraft	60
Loss of speed following engine failure	37
Loss of speed, not due to engine failure ..	144
Forced landings	143
Landing accidents	139
Take-off accidents	78
Taxying accidents	17
Fires in the air	5
Miscellaneous	42
Unknown and doubtful	1

From these figures it appears that 80 per cent. of the accidents during that period were due to the following causes:—

Loss of speed (stall)	181
Forced landings	143
Bad landings (not forced)	139
Bad take-offs	78
Total	541

The general conclusions that can be drawn from the above figures are:—First, that the modern aeroplane is too easily stalled; second, that it is too hard to land; and third, that it is too hard to take-off.

The National Advisory Committee for Aeronautics, in preparing its research programme, has considered the analysis of aircraft accidents, and has included a programme of research intended to improve the safety of aeroplanes from the standpoint of aerodynamics. In accordance with this programme of aerodynamic safety the Committee is studying the stability, controllability, manœuvrability, landing and take-off, and spinning characteristics of aeroplanes.

Studies are also being made of ice formation in flight and of gusts.

For the improvement of aerodynamic efficiency the Committee is studying the problem of aeroplane performance and the subjects of increased lift and decreased drag.

Studying Structure Failures.

Although there have been very few accidents to commercial aeroplanes as a result of structural failures, the National Advisory Committee is planning to extend the work on the determination of the aerodynamic loads and load distribution to commercial type aeroplanes.

A study of the loads supported by the structures of aeroplanes of military types has been carried on for the last three or four years and has reached the furthest development in the tests on the PW-9 Boeing pursuit type aeroplane. The Advisory Committee, in investigating the pressure distribution over the PW-9 aeroplane, not only included the wings, tail surfaces, and the control surfaces, but investigated the pressure distribution over the fuselage.

The PW-9 was tested in a pull-up at 186 miles per hour, where the acceleration registered is 9 g. The weight of the aeroplane is 3,000. The total load on the structure in this manœuvre was 27,000 pounds, of which the upper wing took 18,300 pounds, the lower wing 6,700 pounds, the fuselage 1,650 pounds, and the tail 350 pounds.

The National Advisory Committee plans to investigate in as thorough a manner the pressure distribution on commercial types of aeroplanes. I appreciate that commercial aeroplanes are not expected to be subjected to the kind of treatment that the PW-9 received, and that at the present time there is a lack of information on the structural conditions under which commercial aircraft have to work.

There is also a lack of information on the loads really imposed in flying under severe weather conditions or in rough country. It will be of considerable value to designers of aircraft if the maximum loads under which transport aeroplanes must work can be determined, especially when operating over mountains or under the most unfavourable weather conditions. It is important that a study be made to include the measurement of the total load and of the load distribution on both biplanes and cantilever type monoplanes.

The results of these investigations will have an important bearing on the regulations affecting the stress analysis of commercial type aeroplanes.

The study of pressure distribution has been extended to include the determination of water pressures on seaplane boats and floats with various types of landing gear. This information will, of course, be extended to commercial type seaplanes and will have an important bearing on the design of the structure of a seaplane boat.

Another example of the problems being studied by the National Advisory Committee in connection with the determination of the loads on an aeroplane structure is the investigation of landing gears. In making a study of landing gear characteristics a comparison has been made of the load transmitted to the fuselage when using the oleo type shock absorber and when using a rubber type shock absorber. Tests indicated the amount of load transmitted to the fuselage with both types of shock absorber in a normal, a two-point and a pancake type of landing. In all cases the oleo type of shock absorber transmits only about one-half of the load to the fuselage that is transmitted when a rubber type shock absorber is used. This work is increasingly important if imperfect landings are made.

As mentioned before, most of the investigations to determine the aerodynamic loads in the aeroplane structure in flight and in landing have so far been conducted on aeroplanes of the military type. The instrument equipment and our technique in conducting such investigations have been developed to a point where it will be comparatively easy to extend the investigations to commercial aeroplanes of different types. With the information obtained from such investigations the regulations governing stress analysis can be drawn so that in the future the factor of safety will be such that structural failures will be greatly decreased, and if they do occur they will probably not be due to using a too low design factor but to imperfect workmanship or material.

Spin Studies.

The experience we have had in America with peculiar and dangerous spins of aeroplanes of widely different types has necessitated the study of the spinning problem from every angle. The accidents recorded as a result of spins are due in a large measure to an aeroplane stalled in such a position that recovery is not possible, although the spin in most cases is of the so-called "normal" type.

Digitized by Google

One problem which is regarded as of very great importance from the standpoint of safety is that of the "flat" spin, so called because the aeroplane spins with its longitudinal axis at an angle close to the horizontal. We have had a number of cases of aeroplanes falling from a normal to a flat spin after two or three turns. In most cases it was impossible to recover control of the aeroplane from the flat spin.

It is commonly recognised that there are two separate systems of forces at work on an aeroplane in a spinning manœuvre, the aerodynamic and the mass or inertia forces. As an example, I will cite our experiences with the NB training type seaplane.

There are a number of instances where this type of aeroplane crashed as a result of a flat spin. The rate of descent, however, was so slow that in no case was the result of the crash fatal to the pilot or the observer.

In studying this particular type of aeroplane, free dropping tests were made of models of the aeroplane, demonstrating that the type of spin, flat or normal, could be controlled by shifting weights along an axis of the model.

The mass distribution of the aeroplanes of which we know the type of spin, and particularly all that have a tendency to flat spin, has been determined, and these mass distributions have been studied to discover if any consistent relation between mass distribution and type of spin exists. The method employed in determining the mass distribution of the aeroplane is briefly as follows:—

The aeroplane is swung as a pendulum about several different axes to determine the ellipsoid of inertia of the aeroplane. Without going into detail, it is sufficient to say that the ellipsoid of inertia represents the mass distribution of the aeroplane. The ellipsoid of inertia gives us the principal axis of inertia in a direction with respect to the vertical and horizontal. From this information and from the fact that a solid in revolution tends to rotate about its principal axis, we can determine the type of spin the aeroplane will make if acted upon only by the dynamic forces due to its mass.

I have outlined one or two investigations of a programme of research that is being undertaken as a result of our experience in the analysis of accidents to commercial types of aeroplanes. We shall strive to take advantage in every way of what we learn from accidents, in planning our further research programme. From our present analysis more than half of all air accidents are attributable to the pilot, resulting from stalls, spins, landing, and taking off.

Our final aim is to make the aeroplane capable of assuming a much greater share of the responsibility for safe flying than it can assume at present. The extreme safety requirements of the aeroplane for the private owner can be considered as a most effective guide in planning our research programme.

CAUSES OF ACCIDENTS.

While our experience in accident analysis has been rather limited, it is interesting to compare the results of the board during 1927, 1928, and 1929. Accidents attributable to structural failures, adverse weather, darkness, airports and terrains all show a constant decrease, indicating a steady improvement in the design and manufacture of planes and the construction and maintenance of air navigation facilities.

With the supervision of pilots' training, accidents due to errors of judgment and poor technique should also decrease. However, it must be borne in mind that in analysing the accidents you always arrive at a total of 100 per cent. Therefore, charts and figures cannot be relied upon to indicate the true progress which is being made in improving the safety of aerial operations.

The greatest percentage of accidents is due to spins and stalls with or without engine failure. However, the accidents caused by spins and stalls with the power plant functioning properly show a steady tendency to decrease. This is due to the results of the scientific studies which have been made to control more effectively the planes at or under stalling speeds. The department now requires that all the smaller types of planes must be spun six turns and recover when the controls are released.

Next in importance to spins and stalls are take-off and landing accidents. The latter are divided into two classes: those resulting from forced landing and those occurring under normal conditions. The percentage of accidents due to forced landings is relatively high. While not all forced landings are caused by power plant failure there is a close similarity between the percentage under forced landings and power plant failures.

It is quite apparent that the pilot is at the present time the most important factor in safe air transport. It is, therefore, interesting to study the experience of pilots with reference to their own fatalities. We have made such study and the results have been charted.

The curve shows clearly that the critical period for a pilot is during his first 600 hours in the air. At that point the curve begins to flatten out, and by the time that it reaches 1,500 hours it becomes practically a straight line. This chart was compiled from the experience of commercial pilots. Similar charts have been plotted for the pilots of the Army Air Corps and the Naval Bureau of Aeronautics. They indicate the same characteristic curves.

During the past four years a trophy has been awarded annually to the naval pilot flying the greatest number of hours without injury to personnel or material. In each case the trophy has been won by the pilot having the greatest number of hours of flying. At the time of the last award it was suggested that the conditions be altered so as to award the trophy to a squadron rather than to an individual. If this change is made it will be interesting to note whether the same results will be obtained with reference to a group as has been the case during the past four years when the records of individuals alone were the determining factor.

It is encouraging to observe that the flying time per fatal accident has increased from 650,000 hours at the beginning of the year to nearly 800,000 at the end of the year.

From the study of aircraft accidents it should be possible for us to determine the weak points in the existing air regulations or in the technical development and construction of aircraft. It is our hope that similar methods will be adopted by the aeronautical authorities of other countries thus permitting a composite analysis of all aircraft accidents on the same basis.

While safety is of primary importance in air transportation, if civil aviation is to develop on a sound economic basis it must be able to render a service worth more to the user than the cost to the operator plus a reasonable profit.

THE VALUE OF SPEED.

Speed is a factor which vitally affects the value of the service and the cost of performing it. A very interesting and important study was undertaken a little over a year ago by the scientists on the staff of the National Advisory Committee for Aeronautics. It had to do with reducing the parasite resistance of radial air-cooled engines. By means of full scale wind tunnel tests a new cowling was developed for this particular type of engine. When the tests were actually made in the air the results achieved were most satisfactory.

The new cowling increased the speed of the plane equipped with a single engine of 220 h.p. by from 15 to 20 miles an hour without any increase in engine speed or fuel consumption. Obviously, this not only reduced the cost to the operator but enabled him to render better service to his customers.

However, the most important study which has been conducted with reference to power plants is the one pertaining to the development of the Diesel engine. While there are indications that this problem is well on the way to solution I am not in a position at the present time to give any detailed information as to what has been accomplished.

GROUND ORGANISATION.

As was mentioned in the beginning, the contributions of science to the development of civil aviation have not been confined to the fields of aerodynamics and internal combustion engines. As has been truly stated, an airway begins and ends on the earth's surface and all of the equipment for the airway must be located thereon. A striking illustration of the number of items involved in laying out such an airway is to be found on the progress chart of the Transcontinental Air Transport. This chart was prepared by engineers of that company which, as you know, is now operating a combined air and rail service between New York, Los Angeles and San Francisco. There are eleven intermediate stops between the three terminals and nearly a hundred different items to be attended to at each terminal and intermediate stop.

This involves the selection and acquisition of the site, lights, buildings, wireless, meteorological service and communication systems, each of which requires scientific study if the best results are to be obtained. Likewise, practically all of them have some bearing on the five fundamental factors upon which the success of civil aviation depends. It is obvious that with such a diversity of problems confronting this newest method of air transportation, the closest co-operation not only between the scientists and the Governmental authorities is essential, but co-operation between those interested in the solution of these problems.

The field is international as well as national in scope. The truth of this statement is well demonstrated by the occasion. This meeting is held in England under the auspices of the Royal Aeronautical Society. The lecture is dedicated to the memory of an American, Wilbur Wright, who, with his brother, Orville Wright, first demonstrated the practicability of man navigating the air in a power driven heavier-than-air machine. The date selected is the twentieth anniversary of the first great international flight. It was made by Louis Blériot, a Frenchman, from Calais to Dover, across the English Channel. As an illustration of the youthfulness of this art, it can be pointed out that both Orville Wright and Louis Blériot are still actively engaged

in applying their efforts and genius to the advancement of the science in which they were pioneers. Thus it is certainly apparent that the promotion and regulation of civil aviation presents one of the most fascinating scientific as well as economic and administrative problems of our age.

PROFESSOR FRED LANCHESTER, who is largely famous for having written two books, entitled "Aerodynamics" and "Aerodonetics," which nobody seems to understand, then proposed a vote of thanks to Mr. McCracken, and told us a good deal about what he (Professor Lanchester) had done for aviation.

LIEUT.-COL. MOORE-BRABAZON seconded the vote of thanks in his usual humorous way, saying that the highest tribute to Mr. McCracken's excellent paper was the way in which so many of our foreign visitors had listened to it with rapt attention,—without understanding a word of it. Col. Brabazon ended by saying that Mr. McCracken had told us how in America flying was being turned into dollars and he would now proceed to show Mr. McCracken how lecturing on flying could be turned into pounds,—whereupon he handed him a cheque for the fee which is conferred by rule on those who deliver the Wilbur Wright Memorial Lecture. Which fee was duly and gracefully returned by Mr. McCracken.

Col. Sempill having wound up the proceedings in proper form, the assembled company proceeded to converse and one noticed that they were all so interested in one another that hardly any of them even took the trouble to walk round the extraordinarily interesting aeronautical relics in that section of the museum. This at any rate indicates that the Conversazione as such was a remarkable success.—C. G. G.

THE CIVIL AVIATION COMMITTEE.

The Air Ministry announces that Lord Thomson, Secretary of State for Air has formed a "Civil Aviation Consultative Committee," to assist him in the examination of questions relating to Civil Aviation. Mr. F. Montague, M.P., Under-Secretary of State for Air, will be the Chairman.

The terms of reference are:—"To examine and report to the Secretary of State for Air on questions relating to the development of Civil Aviation in the British Empire."

In addition to the Chairman, the Committee will consist of seven members, three being Members of Parliament (one from each party), one having expert knowledge of aviation, and the remaining three having special experience of industrial and transport problems.

The names of the Committee are:—Sir William Brass, M.P., Sir Archibald Sinclair, Bt., M.P., H. Snell, Esq., M.P. (Parliamentary Representatives); Sir Allan Anderson, K.B.E. (Shipping); F. G. Evans, Esq., C.B.E. (Railways); Sir Ronald Nugent (Federation of British Industries), and Lt.-Col. Mervyn O'Gorman, C.B. (Aviation).

AN AUSTRALIAN LUNCH.

A lunch was given at Australia House on July 18 by Major C. W. C. Marr, D.S.O., M.C., Minister of State, Commonwealth of Australia, on behalf of the Government and people of Australia, to welcome Sq. Ldr. C. E. Kingsford Smith, M.C., A.F.C., and his companions on their flight from Australia.

Major Marr, proposing the toast of Sq. Ldr. Kingsford Smith and his companions, said that the lunch had been rather hurriedly arranged because the Guests were leaving for Amsterdam on the following morning. Letters of regret for their inability to attend the lunch had been received from Lord Stradbroke, a former Governor of Australia, Marshal of the R.A.F. Sir Hugh Trenchard, Air Vice-Marshal Sir Sefton Brancker, the Duke of Sutherland, Sq. Ldr. Hinkler and many others.

In the course of his remarks, Major Marr said that Australia had every reason to be proud of the part played in the development of aviation by her sons. He spoke of the pioneer work of Alcock and Brown, the Smith brothers and Bert Hinkler. Sq. Ldr. Kingsford Smith was the first man to fly across the Pacific and when he had crossed the Atlantic from East to West, as he proposed to do, he would have flown round the world. Sq. Ldr. Kingsford Smith's flight had brought England and Australia within a fortnight of each other and the flight was the beginning of a regular air route. It was not difficult to realise the value to the development of trade within the Empire when Australia would be brought so near to the Mother Country. The growth of Aviation in Australia recently had been tremendous. In the year ending June 30, 1929, 1,200,000 miles had been flown, exactly three times as many miles as the previous year. The new air mail which had recently opened between Perth and Adelaide had brought Perth three days nearer to England. The Commonwealth Government was subsidising a valuable and efficient air medical service. A few weeks ago some shearers had finished the clip at a station some 40 miles from Longreach in Queensland and had telephoned to the aerodrome there for an air taxi to come and take them to the railway station as the roads were impassable owing to floods. The Sydney Flying Club had trained 100 pilots and was flying 100 hours a week. In developing Civil Aviation Australia was at the same time helping its air defence.

A WINNER.—Miss Sale-Barker, winner of the Women's Competition on the Reid Aptitude Indicator,—at Hanworth, with Mr. Schofield, of National Flying Services,—in the new uniform of the N.F.S. pilots.

Mr. F. G. L. Bertram, C.B.E., Deputy Director of Civil Aviation, supporting the toast, congratulated the pilot on a gallant and successful flight. Their performance was still more remarkable when it was considered that they were actually only flying on 12 days. Their flying time had been 112 hours with a ground speed of 90 m.p.h. over a distance of 9,755 miles. The Department of Civil Aviation was in close touch with the Dominions and communications were made by means of Air Liaison letters from a representative in each Dominion. He hoped that by the end of next year there would be a weekly air service between England and South Africa.

Sq. Ldr. Kingsford Smith said they were very sorry to have to leave London the next day but they had to go to the works at Amsterdam. They were delighted to meet so many other Australians in London. During their very agreeable stay nothing had amazed them more than the superlative flying of the R.A.F. at Hendon. Throughout their flight they had received great courtesy and kindness from all the British Service and Civil air authorities.

Mr. Ulm said that if their flight had been of service to Aviation within the Empire they had been amply repaid. He had been very much impressed by the enormous importance of the Singapore Base. During their flight they had realised that this Base brought the Royal Air Force within two days of Australia. He understood that financiers in Sydney had expressed their willingness to support the expansion of the air route from India to Australia. The flight would not have been possible without the valuable co-operation of the other two members of their crew, Mr. Litchfield and Mr. McWilliams. Their flight had made them realise what a wonderful thing Sq. Ldr. Hinkler had done in flying alone to Australia in a light aeroplane in 15 days.—C. M. MCA.

GOLD BY AIR.

On July 27 seven British and French aircraft transported from London to Paris 18,000 lbs. of gold in ingots, representing, in value, about £4,400,000. One machine alone carried over 5,000 lbs.

Mono-Spar

THE STIEGER MONO-SPAR SYSTEM OF AIRCRAFT CONSTRUCTION.

Of the greatest possible interest to all concerned in aircraft is any improvement which results in a substantial reduction in structure weight of aeroplanes, with its consequent immensely important increase in "pay load."

The structure weight of aircraft in relation to the "all up" weight has, in recent years, become a figure varying from 30 per cent. to 35 per cent. for normal commercial machines with normal factors of safety.

The Stieger Mono-Spar System reduces the structure weight to figures hitherto unattainable. It brings the aerodynamically clean *cantilever monoplane* structure weight actually *below* that of the corresponding *biplane* structure. Further, stress calculations are simplified and manufacturing costs reduced.

All the above advantages are obtained whilst otherwise conforming in every way to normal strength requirements and also complying with the known desirable design requirements in regard to the prevention of Wing-Flutter.

THE CLOSING BANQUET AND THE HONOURING OF M. BLERIOT.

On July 27 The Society of British Aircraft Constructors held the closing function of this strenuous fortnight. Such of our guests from overseas as had survived the Show, and had not either returned home or collapsed, were bidden to this banquet, and all and sundry who were concerned with the Show were allowed to buy tickets for it and to bring their feminine attachments. The result was one of the biggest companies yet gathered together in the name of aviation, and certainly one of the brightest. Even the speeches were brief and bright.

The Toast of the evening, "The Pioneers of Aviation," was proposed by the Honourable W. P. McCracken, Junior. He said that the proposing of such a toast was an honour to the representative of that country which was so fortunate as to have the Wright Brothers among its citizens. Every country had made a substantial contribution to the new art of flying. In the twenty years since M. Blériot had flown the Channel every Continent had been spanned and every ocean crossed and both Poles had been explored by air. This should be a consolation to our pioneers. Since the earliest days Man's ambition had been to fly and because of our pioneers we now realised the longing of our forefathers.

M. LOUIS BLERIOT, responding, said that he was sorry he did not know English and was obliged to speak in French. He expressed his profound deference to our Minister of Air and he referred gracefully to the British pioneers whom he had known personally, recalling by name Captain Bertram Dickson, and Hamel, and Hucks, and Sopwith, and Alcock and Brown. He complimented us on what he gracefully called our Marvellous Exposition.

SIR ARTHUR WHITTEN BROWN said that when ten years ago he and John Alcock had flown the Atlantic they counted themselves as treading as closely as possible on the track of M. Blériot. He said that M. Blériot was the first to show that the aeroplane was not a toy but a means of transportation. The fact that in ten years he himself should be included among the pioneers of aviation was a sign of the times, though it was an honour which he much appreciated. The Wright Brothers had shown that flying was practicable and M. Blériot had proved it to be a means of transport.

MR. T. O. M. SOPWITH said that he felt that we were all still pioneering to-day. Aviation was still so young, and development was as fast as ever. During the War he had said that every new machine was out of date before it left the workshop, and that was equally true to-day. [One would go farther and say that thanks to the curious inertia which afflicts humanity the majority of aeroplanes are out of date before they are designed.—C. G. G.] Manufacturers, he said, could not develop their goods without customers, and the Aircraft Industries of all nations owed a debt of gratitude to their Governments. Personally he thought that we were lucky to be alive. But the younger generation took flying entirely for granted.

He expressed his pleasure at having M. Louis Bréguêt present, as well as M. Blériot, besides Sir Alliott Roe and Mr. Handley Page. He recalled the names of the earliest British pioneers,—in particular Howard Wright, Manning, Short, de Havilland, Cody, Rolls and Cecil Grace, and he proposed that before drinking to the living pioneers of Aviation we should drink a silent Toast to those who had gone before.—Which was duly honoured.

SIR SEFTON BRANCKER, proposing the Sport of Flying, said that this was a fitting conclusion to a strenuous fortnight. He had looked up the word "sport" in the dictionary and found that it meant "that which promotes mirth." Searching further he found that it was derived from "*se desporter*," meaning to carry oneself away from one's work. Since M. Blériot flew the Channel other had beaten us at all forms of sport but we should in time get our own back.

He said that he had found that Governments are not so stupid as they look [a statement which caused huge delight] and consequently we had had light aeroplane competitions promoted by our Government, and we had had a certain mediocre support for our Flying Clubs. The light aeroplane movement, he said, was essentially a sporting movement run by young men and women who worked for the Clubs in their spare time. The result was that to-day we have more private owners and more sporting flying than the rest of the World put together. This Aircraft Exhibition of ours was intended to give foreigners a chance of catching us up.

Continuing, Sir Sefton said that the great thing to promote progress was to get away from rules and regulations. Personally he was all in favour of letting people break their necks if they wished. Sportsmen, he said, were usually poor, consequently we owed much gratitude to the supporters of the sport of flying like Jacques Schneider, Gordon Bennett, Pulitzer, and Sir Charles Wakefield, whom he always called the Patron Saint of Aviation.

He regarded M. Blériot as being the greatest sportsman in flying up to date. When he flew the Channel his engine had never run as much as the 33 minutes which he took to cross the Channel, and it never ran as much again. He said that among our pioneers we certainly should include his old friend Henri Jullerot, who made the first flight in India when he took him (Sir Sefton) flying over the Jungle.

Civil Aviation, Sir Sefton said, was a boon. We were now able to bathe in other peoples sparkling wine instead of stewing in our own juice at home. He said that M. Flandin had been set down to reply to this Toast, but unfortunately he was unable to be present. Neverthless he would couple M. Flandin's name with the Toast as a courageous and good friend who had done much to smooth out the difficulties in Civil Aviation. He coupled also with the Toast the name of M. Caproni, the famous Italian aircraft constructor, who made the first tri-motor aeroplane, and Lieut.-Col. Mervyn O'Gorman, who, he said, was a very old bird in aviation and had represented Great Britain on every international sporting committee.

SIGNOR CAPRONI, once the maker of the World's biggest aeroplane and now a maker of some of the smallest aeroplanes as well, thanked everybody for a nice and friendly week and congratulated us on our beautiful Show. He assured us that we should be very proud of our small 'planes. And he expressed his pleasure at the way aviation made for friendship.

LIEUT.-COL. MERVYN O'GORMAN said how delightful it was to be connected with a movement which thus made for friendship. He said that he might add much to Sir Sefton Brancker's definition of sport, as the epithet "a sport" ranged all the way from a brave fellow to a good sort. He said that a French friend of his, endeavouring to get the exact meaning of the word sport, had said that in France they had many words for a sharp fellow at a race meeting.

Becoming serious, he said that the Royal Aero Club and *Fédération Aéronautique Internationale* had done much hard work to keep the sport of flying clean and pure, and to promote competition between the brains of designers and the skill of pilots. At least the sport of flying was completely above-board and those concerned with it had borne in mind that the sport had a great human objective, namely a friendly interchange between nations.

Unfortunately, he said, Europe was cut up into little parcels, at which there were people ready to pick everybody's pockets at every frontier town. Hence the invention of the *triptyque* and the *carnet de passage*. This at any rate made journeying into foreign countries easier, in that one only had one's pocket picked at home at the start.

CAPT. P. D. ACLAND (Chairman of the S.B.A.C.), proposing the Toast of the Chairman, Lord Thomson, said that this was a happy culmination of one of the happiest periods in the history of British aviation. Such pleasure was difficult to express in English. Other languages could do it so much more gracefully.

He wished to pay a tribute to the men who had worked so hard behind the scenes to make a success of the Show and everything that went with it. He referred in particular to Mr. C. V. Allen, the Secretary of the S.B.A.C., and to Mr. J. C. P. Phillips, the Manager for the Organisers of the Show, who, he said, speaking as an exhibitor, "is always up against us and yet remains one of us." He also tendered his thanks to Squadron Leader A. R. Boyle, O.B.E., M.C., of the Air Ministry, who, with his devoted staff, had contributed so enormously in looking after the distinguished visitors whom we had had the pleasure of entertaining.

Lastly he referred to our Chairman, the Secretary of State, who, he said, needed no recommendation. While out of office he had continued to study aviation, and he now returned to carry on the good work of Sir Samuel Hoare.

LORD THOMSON said that there was little to thank him for. He had meant to remain silent to the sweet end of an agreeable evening. Certainly none of his distinguished fellow-guests would grudge the tributes paid to M. Blériot. It was an extraordinary satisfaction to the Government and to himself to be able to do honour to this great airman. The Government had paid him the tribute of sending a Squadron of the Royal Air Force to escort him to this country and to mark the friendly relations between our two great nations. Speaking as an old soldier himself he said that soldiers respected men of deeds, and M. Blériot was essentially a man of achievement.

In conclusion he asked his hearers to consider what a difference will be made to the World if in future we use and do not abuse this great gift of aviation. He ended by proposing a Toast to Madame Blériot.

The hour being then about 23.00 the majority of those present lingered for a considerable time as if unwilling to bring to an end what Capt. Acland so rightly called "the happy culmination of one of the happiest periods in British Aviation."—C. G. G.

THE BLERIOT CELEBRATIONS.

M. Bleriot at Dover.

On July 27, to celebrate the twentieth anniversary of his first flight across the Channel on July 25, 1909, Monsieur Louis Blériot flew across the Channel in a Blériot 127 monoplane. He was met over the Channel by No. 41 (Fighter) Squadron, R.A.F., and escorted to the English Coast. At Dover a landing was made at Swingate Aerodrome, and, after being received by the Mayor of Dover, Alderman H. E. Russell, Sir Sefton Brancker and M. M. Datte, French Consul at Dover and Folkestone, M. Blériot visited the North Fall meadow, where he alighted at the end of his historic flight in 1909.

The Mayor of Dover spoke of the historic value of the first flight across the Channel, and cordially welcomed M. Blériot. Sir Sefton Brancker said that the first flight had made this country definitely part of the Continent of Europe. M. Blériot recalled his first flight and thanked everybody for his welcome. Thereafter he left Swingate aerodrome for Croydon.

M. Blériot's arrival at Croydon.

A large crowd of notabilities and others were at Croydon on Saturday, July 27, to welcome M. Blériot. Punctually at 16.30 hrs. a Blériot 127 (two 500 h.p. Hispano-Suizas) arrived over the aerodrome escorted by *The Daily Mail's* Giant Moth, two of the De Havilland Company's Gipsy-Moths and Air Taxi's Fokker Universal.

M. Blériot was in the second pilot's seat and M. Bossoutrot was pilot. M. Bajac, chief pilot of the Air Union, was navigator, so that M. Blériot could not have had a more competent crew.

A crowd surged round the machine and M. Blériot had considerable difficulty in reaching the aerodrome buildings, where he was received by the Air Minister, Lord Thomson of Cardington, the Under-Secretary, Mr. F. Montague, M.P., Air Vice-Marshal Sir Sefton Brancker, Mr. G. E. Woods Humphery of Imperial Airways, Major Richard, O.C. Aerodrome, and, of course, the usual collection of modocks.

M. Blériot contrasted the modern air liners with Blériot XI (25 h.p. Anzani) on which he flew the Channel 20 years ago.

The Calais Welcome to M. Blériot.

On Sunday, after having been honoured by British aeronautical and civic organisations at the Closing of the Exposition Banquet by the S.B.A.C., as described hereinbefore, M. Blériot received an enthusiastic home-coming welcome at Calais.

Accompanied by two Golden Ray aeroplanes of the Air Union, M. Blériot left Croydon aerodrome in the big Blériot monoplane bomber at 10.30 hrs.

A party of distinguished guests flew in the two commercial air liners by the invitation of M. Grosfils, the London Director of the Air Union. These guests included the Hon. Wm. P. McCracken, Jnr., Assistant Secretary of Commerce for Aeronautics in the U.S.A., Sir Sefton Brancker, M. Louis Bréguêt, Col. the Master of Sempill and the Hon. Mrs. Forbes-Sempill, Lady Cobham, Mrs. Blackburn, Lieut. de Vaisseau Sala (the French Air Attaché), Mr. Lester D. Gardner of New York, M. and Mme. Grosfils.

At the aerodrome of St. Inglevert about forty aeroplanes of military and civil types awaited M. Blériot, and as he landed, followed immediately by the two accompanying airline machines, he was given a most enthusiastic reception.

As greeting, a newly-built replica of his original Cross-Channel monoplane, with an Anzani motor, flew over the scene of welcome, and after it landed M. Blériot, accompanied by Mme. Blériot, received the applause of the several thousand people standing around the primitive-looking machine.

The guest party were then driven to Les Baraques, where, at the monument erected by the Aéro Club de France on the place from which the first Cross-Channel flight started, speeches were made on the historic spot by M. Laurent Eynac, French Minister of Air, and M. Pierre E. Flandin, President of the Aéro Club de France.

A Civic Banquet followed at the Hotel Terminus, which was attended by about a thousand notables of Calais, as well as many visiting guests. M. Eynac, Sir Sefton Brancker, Mr. McCracken and many other speakers toasted M. Blériot, who responded with an appreciative speech.

After the banquet a display of seaplane flying was held along the Plage, and at the St. Inglevert aerodrome a series of exhibition flights was given to entertain the thousands of visitors who had come from all parts of Northern France.

Squadrons of French military aeroplanes gave exhibition flights of formation flying during all the ceremonies, much to the discomfiture of some of the speakers and listeners as well. At 18.00 hrs. the two Golden Ray aeroplanes left St. Inglevert, flew to Dover, where they circled M. Blériot's original landing-field, and returned to Croydon with the guests who had left England in the morning.

WELCOME AGAIN!—M. Louis Blériot greeted on his arrival on Swingate Down by the Mayor of Dover and Sir Sefton Brancker.

M. Blériot's Historic Film.

On July 29 Monsieur Louis Blériot gave a short lecture describing his film of Twenty-Seven Years of Flying before members of the Royal Aeronautical Society and others at the theatre of the Royal Society of Arts.

Colonel the Master of Sempill, Chairman of the Royal Aeronautical Society, introducing the speaker, said that M. Blériot had made a habit of flying across the Channel during the last few days. He had come back to-day on purpose to show us this film, which he was taking straight back to the Sorbonne, and it would not be seen in England again. As M. Blériot would speak in French, Mr. Bramson, a member of the Council of the Royal Aeronautical Society, would interpret for the benefit of those who did not understand French.

M. Blériot said that he had been asked to express his views on the subject of the future of Aviation. Although he believed that a good deal of flying would be over the sea he believed that the greater proportion of the World's air routes would be operated by land machines.

He thought that within five or six years air communications between Europe and America would be maintained by land machines which would alight on floating islands in the Atlantic. He had seen small-scale models of such islands with their surface well above the surface of the water, and he thought that they could be designed to remain stable in the roughest seas. These islands would have to be kept in position by motor power as it would be impossible to anchor them. There should be six or seven of them between Europe and America. A complete chain of wireless direction finding for navigation would also be necessary.

Such routes could be operated by the ordinary machines of to-day. But the ideal means would be two great wings carrying a life-boat. The life-boat must be completely closed in and unsinkable, and there must be a device for detaching the wings immediately the boat touched the water. [*Vide* THE AEROPLANE any time for the past ten years.—C. G. G.]

Each trans-Atlantic aeroplane would have to carry enough fuel to enable it to pass over any floating island which was fog-bound and go on safely to the next. The success of such a route would be dependent on the "ground" organisation for many machines were now in existence which could do the flying part.

M. Blériot apologised for the film, which he said he had built up bit by bit for his family and was therefore of rather a personal nature. Also the earlier parts of it, some of them dated from 1905, were rather old now and were somewhat flickering and sketchy. [These ought to be copied and multiplied for the benefit of posterity, before they become invisible.—C. G. G.]

M. Blériot had no need to apologise for his film. Apart from the tremendous interest such a film must have for anyone who is interested in the early flying days, this film is remarkably clear and steady.

Beginning in 1905, it shows his very early experiments with

Digitized by Google

The pilot's safeguard *against FIRE*

The life of the pilot and those of his passengers may depend upon the efficiency of the fire fighting equipment installed in his machine. No other fire extinguisher can compare with the "ESSEX" for use in aircraft of every type. After exacting tests the "ESSEX" has been adopted by the Air Ministry for use in R.A.F. machines and in aircraft flying on British Air Lines *because it is the most efficient.*

The wonderful new liquid in the "ESSEX" *smothers* a petrol fire instantaneously and, in addition, the "ESSEX" is very light in weight—it does *not* generate poisonous fumes—it does *not* conduct electricity and it cannot possibly get out of order.

Since the "ESSEX" is hermetically sealed and the liquid cannot corrode the jet or container it *always* comes into instant action. And only one hand is needed to operate the "ESSEX"—no pumping is necessary.

Insist on the

ESSEX

The Safe Extinguisher

Entirely British Made

The "ESSEX" was installed on all the flying boats of the "Empire Cruise" and is fitted in both the giant Airships R.100 and R.101

"Bristol"

AIRCRAFT OF METAL CONSTRUCTION

Experimental and research work upon aircraft steel structures has been an important part of the Bristol Aeroplane Company's activities for more than ten years, during which period many types of aircraft have been designed, manufactured and tested in flight. The most recent product is the famous "Bristol" Bulldog single-seater fighter, which has been adopted by the Royal Air Force as standard equipment, and which has also been supplied to many foreign powers.

The construction and operation of these machines has proved, beyond dispute, that the "Bristol" method of construction is at once exceptionally serviceable and easy to maintain and repair.

Information concerning the Bulldog single-seater fighter and other military, commercial and training aircraft is available, together with a full description of the steel construction used.

the ancestors of all the Blériot machines. The triumph of the first hops of a few yards and the disaster of the experiments with his seaplane on the Seine are followed by the more substantial 60 metres flight in 1907 and the 184 metres a few months later.

We saw the whole Blériot series from I to XI, the latter the machine which crossed the Channel. In 1909 he won the Prix Osiris and in 1910 he received pilot's licence No. 1 of the Aero Club de France.

We saw him hobbling on crutches from an earlier crash to climb into his machine to cross the Channel and the weird shape of it disappearing into the distance. Then came the first aviation meeting at Reims, the triumph of Blériot machines in the Circuit de l'Est, and the experiments with a launching apparatus consisting of a few wires. Pégoud's first parachute descent and the wonderful movements of the machine after he left it to fall uncontrolled have been marvellously filmed.

From that the film goes to 1914 and the production of the first Spad. There is a glimpse of some famous Spad pilots, Guynemer, Fonck, Nungesser and others.

Then came the Armistice and the four-engined commercial machine, the big amphibian designed for Blériot's son to fly the Atlantic in. M. Blériot said that he was bringing this machine over for the Schneider Trophy, but not in order to compete. Lastly the film showed the B127 in which he crossed the Channel on Saturday. He calls it a destroyer of the air.

After the film had been shown, a short film brought over from the U.S.A. by Mr. McCracken was shown, chiefly because M. Blériot wanted to see it. It showed a Loening Amphibian falling to the ground from 4,000 ft. in a series of 32 flat spins. Neither of the two occupants of the machine was hurt.

Proposing a vote of thanks on behalf of the assembled company to M. Blériot, Mr. McCracken said that, in addition to all his wonderful pioneering work, the World owed a debt of gratitude to M. Blériot for his vision and foresight in taking and keeping this fine record for posterity.—

C. M. MCA.

THE SCHNEIDER TROPHY CONTEST.

The draw for the order of starting in the Schneider Trophy Contest to be held in the Solent on Sept. 7 was made at the Royal Aero Club on July 24 in the presence of the Air Attachés of France, Italy and the United States of America. The draw resulted as follows:—

1 U.S.A., 2 England, 3 France, 4 Italy, 5 England, 6 France, 7 Italy, 8 England, 9 France, 10 Italy.

Arrangements for broadcasting the contest have been made with the B.B.C. Sq. Ldr. W. Helmore and Flt. Lt R. L. Ragg, A.F.C., R.A.F., will be the announcers and, in addition to a running commentary, results of the laps and the final result will be relayed throughout the World.

The transmissions from 5SW, the B.B.C. experimental station at Chelmsford, will be specially energised for long-distance transmission.

Messages from Daventry will be picked up at official stations in Paris, Rome and Berlin, translated immediately by special interpreters and broadcast again in the appropriate language.

The B.B.C. transmitting station will be on Ryde Pier and messages from Ryde will begin ten minutes before the start of the contest.

A special service of loud speakers on the shores of the Solent will pick up the messages transmitted from Daventry,—and that is about all the public are likely to see of the contest; except at few overcrowded points.

The following notice, prepared at the request of the King's Harbour Master at Portsmouth, should be noted by seafaring readers of this paper:—

Anchorages and Instructions for Small Vessels.

1. Small craft drawing less than eight feet of water may anchor in any of the following areas which have been reserved for them:—
Brambie, Browndown, Hayling, Horse Sand, Mother Bank, Wootton, and West Middle to the East of West Ryde Middle Light Buoy.

2. The details of these areas are shown on a published chart which can be obtained from the Secretary, Royal Aero Club, 3, Clifford Street, London, W.1, the prices of which are eight shillings and sixpence for one of large size and two shillings for a smaller chart, post free.

3. Further details and instructions to be observed by all vessels will be published at a later date.

According to *The Gloster*, the house magazine of the Gloster Aircraft Co. Ltd., the Gloster Company who have for so many years been associated with the Schneider Trophy Race and whose machines have hitherto all been biplanes, have decided to construct a monoplane for the 1929 race. This does not signify that the Gloster Company have altered their views as to the comparative potentiality for speed of the two types. They are still of the opinion that a biplane can be made as fast as a monoplane and it was originally intended to construct a biplane. Models of this biplane were made and it was called the Gloster V. The tests as a biplane were very satisfactory, but difficulties were encountered later owing to the fact that the new supercharged Napier engine was nearly 300 lbs. heavier and consequently, in order to give the correct C.G. position, would have brought the front top spar over the centre cylinder-block. This arrangement was such that it was found impossible to locate the top wing so as to provide adequate view. The Gloster Company were therefore forced to the only alternative of changing over to a monoplane which they have called the Gloster VI.

THE SCARBOROUGH RALLYE.

The following telegram has been received:—

Winner of On To Scarboro Rally will be first machine to arrive and pass between two tents on aerodrome flying from South to North after 14.30 hours Aug. 5, no other conditions whatever. Other competitive events will also be held on Aug. 5 afternoon. Northern Air Lines.

THE MANCHESTER—LIVERPOOL INTER-CITY AIR RACE.

The list of entries for the Inter-City Air Race, to be held on Aug. 10, between two teams of pilots representing Manchester and Liverpool, has now been closed.

Manchester is represented by three private owners—Miss W. Brown, Mr. J. C. Cantrill and Mr. E. Cohen. All of these will fly Avian light aeroplanes.

Liverpool is represented by two entries from the Liverpool Aero Club and one private owner, Mr. T. H. Naylor. The pilots for the Liverpool Club machines are Flt. Lt. Allen and Mr. A. Mousdale. They will use Avian and Moth light aeroplanes.

The race will start and finish at Wythenshawe Aerodrome, Northenden, there being a stop at Liverpool of one hour. During the afternoon and evening there will be an Air Pageant at Wythenshawe, starting at 3 p.m. The public will be charged 1s. admission.

The Inter-City Race is for a Trophy presented by Sir William Cundiff, a former Lord Mayor of Manchester, for competition between two teams of pilots representing Liverpool and Manchester. The pilots must be resident within twenty miles of either City. The aircraft must be standard light aeroplanes and no "faking" or special streamlining, nor alterations of any sort are allowed.

The machines will be handicapped as to their starting time at Wythenshawe. The total distance of the race is about sixty miles.

THE NEW NOTTINGHAM AERODROME.

On July 27 Alderman Atkey, the Lord Mayor of Nottingham, flew from Nottingham to London in a Moth belonging to the Nottingham Aero Club to receive from Mr. F. Montague, the Under-Secretary of State for Air, the licence for the Nottingham Municipal Aerodrome, near Tollerton.

Nottingham is thus the second city in the country to possess a municipal airport. Manchester was the first, but the Manchester aerodrome is not yet in working order,—and is not likely to be for some years, unless the City Fathers make the present temporary aerodrome at Wythenshawe permanent and give up the idea of filling up Chat Moss.

A CIVIC RECEPTION.—Alderman Atkey, Lord Mayor of Nottingham, receiving the license for the Tollerton Aerodrome from Mr. F. Montague (Under-Secretary for Air), while Sir Sefton Brancker blesses the union.

THE ROYAL AIR FORCE.

The London Gazette.

July 23.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Air Commodore P. F. M. Fellowes, D.S.O., is appointed Director of Personal Services, Air Ministry (July 1).

362672 Sergt. E. C. W. S. Smith is granted a permanent commission as a Plt. Off. on probation, with effect from July 15, and with seniority of June 17. The following Plt. Offs. on probation are confirmed in rank, Feb. 8:—W. R. Hartwright; N. C. Odbert.

The following Plt. Offs. are promoted to the rank of Flg. Off.:—JUNE 9.—F. B. S. Downey, G. F. Hales, F. L. Truman, S. I. Ubee. JUNE 14 (WITH SENIORITY OF JUNE 9).—C. Stephenson, C. H. R. Little. JUNE 16 (WITH SENIORITY OF JUNE 9).—G. Wood. JUNE 17.—J. S. Dewar, R. C. Field, E. A. Jones, J. E. MacCallum, N. B. Norris, G. H. H. Procter. JUNE 30.—C. W. F. Carter, C. S. Ellison, J. B. Fyfe, R. L. Mills, L. S. Snaith. JULY 21.—A. F. Britton.

Flt. Lt. J. B. P. Angel is placed on the retired list at his own request (July 22). Flt. Lt. A. L. Chick, A.F.C., is placed on the retired list at his own request (May 14). (Substituted for the notification in the *Gazette* of May 21). The S.S. comns. of the undermentioned Plt. Offs. on probation are terminated on cessation of duty (July 24):—L. W. A. Binks, G. H. Binns, J. F. M. Hearne.

Lt. M. S. Slattery, R.N., Flt. Lt. R.A.F., ceases to be attached to the R.A.F. on return to Naval duty (July 15). Lt. R. M. Giddy, R.M., Flg. Off. R.A.F., ceases to be attached to the R.A.F. on return to Corps Duty (July 15).

ACCOUNTANT BRANCH.—Flt. Lt. H. C. F. Ellis is transferred to the Reserve, Class C (July 24).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted commissions in Class A.A. (ii.) as Plt. Offs. on probation:—JULY 8.—R. A. Robbins, E. G. Villiers. JULY 9.—J. H. Goodden. JULY 10.— R. S. Odd. JULY 15.—J. P. Dewsbery. C. C. Clark was granted a commission in Class A. as a Flg. Off. on probation (July 23). The following Plt. Offs. on probation are confirmed in rank:—E. W. Mackay (June 13); L. F. Hooper (June 25); P. L. D. Teichman-Derville (June 25); P. F. England (July 2); J. F. Legard (July 17).

Flg. Off. F. W. Winterbotham is promoted to the rank of Flt. Lt. and is granted the honorary rank of Sq. Ldr. (July 23). Flg. Off. H. A. Deiny is transferred from Class A. to Class C. (July 20). The following Flg. Offs. are transferred from Class C. to Class A.:—R. H. Mahon (June 19); E. G. Whinney (June 23). The following Flg. Offs. relinquish their commissions on completion of service:—JULY 7.—J. G. Argles, D. R. Sharman, M.C. JULY 21.—H. A. Record. Plt. Off. on probation J. O. Mortlock relinquishes his commission on account of ill-health (July 24).

MEDICAL BRANCH.—Flg. Off. G. Clark relinquishes his commission on completion of service (July 19).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 605 COUNTY OF WARWICK (BOMBER) SQUADRON.—The following to be Plt. Off.:—J. F. Gummow (June 13).

Appointments.

Week ending July 29.

GENERAL DUTIES BRANCH.—Air Commodore P. F. M. Fellowes, D.S.O., to Air Ministry, on appointment as Director of Personal Services, 1/7.

Group Captains H. R. Nicholl, C.B.E., to Air Ministry (D.P.S.) on appointment as Deputy Director of Personal Services, 8/7. G. P. Grenfell, D.S.O., to H.Q., A.D.G.B., for duty as Officer-in-Charge Administration, 17/7.

Wing Commander A. H. Peck, to H.Q., A.D.G.B., for Air Staff duties, 15/7.

Squadron Leaders F. E. P. Barrington, to Air Ministry (D.D.M.), 13/8. L. J. MacLean, M.C., to R.A.F. Depot, Uxbridge, 15/7.

Flight Lieutenants H. J. Gemmel, to Air Ministry (D.D.P.), 15/7. S. L. G. Pope, D.F.C., A.F.C., to Air Ministry (A.M.S.R.), 13/7. W. A. D. Brook, to No. 13 Sqdn., Andover, 8/7. E. S. C. Vaughan, M.C., to R.A.F. Depot, Uxbridge, 1/7.

Flying Officers A. H. Willetts, to Home Aircraft Depot, Henlow, 9/7. G. I. L. Saye, to No. 201 (F.B.) Sqdn., Calshot, 13/5. O. G. Williams, to Armoured Car Wing, Iraq, 2/7. H. H. Martin, to No. 47 (Bomber) Sqdn., Middle East, 3/7. J. N. Young, to Aircraft Park, India, 13/6.

Pilot Officers R. F. Williams, to R.A.F. Depot, Uxbridge, 21/6. J. G. W. Weston, to Andover Communication Flight, 4/7. The following Pilot Officers are all posted to No. 2 F.T.S., Digby, with effect from 15/7:—G. E. Agard-Butler, N. Alexander, F. C. Allen, C. A. Ball, G. Bearne, N. Stratton, J. M. Waddell, G. N. Warrington, G. E. S. Williams, S. N. Wiltshire, G. Calvert, N. J. Capper, I. A. Critchley, C. H. Glover, D. H. A. Golege-Steel, W. E. Grant, D. C. Harrison, W. J. Hodge, A. H. Houghton, G. M. Levers, F. J. B. Keast, D. W. Lydall, I. L. S. McNicol, C. W. Marriott, C. E. Morse, J. T. Vyners, B. Paddon, and H. G. J. Purcell.

MEDICAL BRANCH.—Squadron Leader E. D. D. Dickson, M.B., F.R.C.S. (E.) D.L.O., to R.A.F. Officers' Hospital, Uxbridge, 15/7.

Flying Officer P. M. Margand (Dental), to Station H.Q., Worthy Down, 20/7.

STORES BRANCH.—Flying Officer J. E. Welman, to Home Aircraft Depot, Henlow, 11/6.

ACCOUNTANT BRANCH.—Pilot Officers H. D. Nicholson, to Station H.Q., Tangmere, 22/7. G. E. Shirley, to R.A.F. Training Base, Leuchars, 22/7. E. A. Biddle, to Station H.Q., Upper Heyford, 22/7. C. F. G. Rogers, to Station H.Q., Worthy Down, 22/7. K. Fraser, to Station H.Q., Kenley, 22/7.

CHAPLAINS BRANCH.—The Rev. T. A. P. King, to R.A.F. Depot, Middle East, 19/7.

The Cranwell Passing Out Inspection.

Air Marshal Sir Edward Ellington, K.C.B., C.M.G., C.B.E., Air Officer Commanding-in-Chief, Air Defence of Great Britain, inspected the Cadets of the R.A.F. College, Cranwell, on July 26, on the occasion of the Passing Out of Flight Cadets.

The Commandant, Air Vice-Marshal F. C. Halahan, C.M.G., C.B.E., D.S.O., M.V.O., in his Report said that the total strength of the College was 104. The total flying time during the term had been 4,456 hours, which had broken all records by a considerable amount. The Cadets now passing out had averaged 91 hours' flying, of which 37 hours had been solo on Service types.

The work done in Aeronautical Engineering and Aeronautical Science had been satisfactory. Steps were being

SUPERNA PETIMUS.—Air Marshal Sir Edward Ellington, K.C.B., C.M.G., C.B.E., taking the salute at the march-past of Cadets of the Royal Air Force College, Cranwell, at the passing-out on July 26.

Digitized by Google

taken to co-ordinate the lectures on aerodynamics given by the Science Professors with the practical work in the Cadets' instructional workshop. In English literature and history the term passing out had not fulfilled the promise of its first year and the second term had not yet attained a very high standard. The work done by the third and first terms had been good. Two hundred books had been added to the College library.

The Wireless syllabus had been completely revised. Instruction in Armament and Musketry had been proceeding satisfactorily. The standard achieved in Air Pilotage had considerably improved and more experience had been gained in cross-country flying than had been possible previously. The senior Cadets had been given a series of lectures in Elementary Meteorology.

The Discipline had been good with the exception of one case of disobedience to flying orders.

During the period under review 36 Cadets had been admitted to Hospital as compared with 31 during the period July to November 1928.

The foundation stone of the new College had been laid and the work of building was making good progress.

The standard of physical training had been fair. The Cadets had taken part in five Skill-at-Arms matches this term, two were won and three lost. Far more interest had been displayed in boxing. The cricket season had been fairly successful. The best performance had been that in the match against Woolwich. Rowing had been taken up with great keenness and the membership of the Rowing Club was larger than ever before. The Athletic team had had a very good season and had only been narrowly defeated by Sandhurst in the Triangular contest. Four contests had been held against various Cambridge colleges and one with the London Athletic Club. They had won two against Cambridge. The standard of Hockey had shown a marked improvement. Twelve matches had been played and seven won.

The Chimay Cup for Inter-Squadron games had been won by "B" Squadron with 35 points against "A" Squadron's 5 points.

The Trenchard Cup for Service Subjects had been won by "B" Squadron with 35 points. "A" Squadron had scored 5 points.

"B" Squadron had gained the title of Champion Squadron-at-Arms and was entitled to parade on the right of the line, scoring 70 points to "A" Squadron's 35 points.

The Sword of Honour, presented to the best all-round Flight Cadet in the Senior Term, was awarded to Flt. Cdt. F. W. Niblett.

The R. M. Groves Memorial Prize, for the best all-round pilot in the senior term, was awarded to Flt. Cdt. Cpl. F. C. Cole.

The Abdy Gerrard Fellowes Memorial Prize, for the Flight Cadet obtaining the highest total marks in Mathematics and Science, was awarded to Flt. Cdt. R. L. Phillips.

The Prize awarded to the Flight Cadet in the senior term obtaining the highest marks in Humanistic subjects was awarded to Flt. Cdt. E. de T. Vintras.

The Prize awarded to the Flight Cadet in the senior term obtaining the highest marks in Aeronautical Engineering was awarded to Flt. Cdt. Cpl. D. W. Lane.

The R.A.F. Display.

In the House of Commons on July 26 in reply to a question by Mr. Day, the Under-Secretary of State for Air said that the R.A.F. Display was the culmination of the year's training and it was impossible to isolate practice for the Display from other flying.

The total number of personnel employed in the Display at Hendon had been 340 officers and 1,679 airmen, and the number of aircraft 171. The consumption of petrol and oil at the Display, including journeys to and from Hendon, had been 9,800 gallons of petrol and 653 gallons of oil.

[One may remind Mr. Day, who seems fond of asking futile and/or irritating questions, that if Hendon and the Display did not exist the annual training of the R.A.F. would have to work up to a similar climax, even if the final tests of flying were made over Salisbury Plain or over some part of the Highlands judged inaccessible to the public. So the public, who pay for the R.A.F. anyhow, may just as well see what they are getting for their money, and at the same time contribute to R.A.F. Charities.—C. G. G.]

Fatal Accidents.

The Air Ministry regrets to announce that as the result of an accident near Coventry to a D.H.9 machine of a reserve civil flying school on July 9, Flg. Off. John Douglas Williamson, Reserve of Air Force Officers, the pilot and sole occupant of the aircraft, was seriously injured and died in hospital on July 27.

The Pembroke Air Base.

In the House of Commons on July 26, in reply to a question by Maj. Lloyd George, the Under-Secretary of State for Air said that the total number of civilians who would be directly employed by the Air Ministry at Pembroke was not likely at first to exceed 40, rising to 60 or 70 as soon as an Air Force Unit was stationed there, which could not be for some time to come. Some indirect employment might result before an Air Force Unit arrived from work on structural adaptations, and afterwards from the ordinary local requirements of the Unit.

The Worthy Down Court Martial.

Sentence was promulgated on July 24 on AC.1. William Charles Baldwin, of No. 7 (Bomber) Sqdn., Worthy Down, an account of whose Court-Martial appeared in THE AEROPLANE last week. He was sentenced to nine months' detention with three months' remission.

The Airship Trials.

In the House of Commons on July 26, in reply to a question by Mr. H. Balfour, the Under-Secretary of State for Air said that parachutes would be carried by the crews during the trials of H.M. airships R.101 and R.100. But they would not be worn on the person, as that would impede work. They would be carried in a convenient place in the airship. [Those would-be lighter-than-air travellers who are looking forward to dancing in the ball-rooms of these craft will be relieved to read Mr. Montague's assurance.]

On July 29 the inflation of R.100 was begun at Howden under the supervision of Lt.-Comdr. Burney. This operation will take a week and will be followed by indoor tests. In a month the ship may be ready to take the air.

Central Flying School Categories.

The following officers have been re-categorised from the dates stated against their names:—A2 to A1,: Flt. Lt. J. S. Chick, M.C., A.F.C. (June 14, 1929). B to A2.: Flg. Off. H. H. Brookes (June 28, 1929).

The following officer has been re-categorised as a "B" Flying Instructor:—Flt. Lt. C. L. Lea Cox.

The Useful R.A.F.

A *Reuter* message from Simla dated July 26 states:—

Late on Wednesday night the Foreign Department in Simla received an urgent telegram from the British Minister in Bangkok, which brought news that the heir-presumptive to the throne of Siam, the half-brother of King Prajadhipok, was lying dangerously ill.

The message conveyed an appeal from the king for certain rare drugs, which were apparently unprocurable in Siam, to be sent from Calcutta by aeroplane.

Early the next morning two Royal Air Force Wapitis—said to be the only machines in India capable of making the dangerous passage through the monsoon area to Bangkok—were on their way from the frontier station of Risalpur to Calcutta. The most necessary of the drugs was immediately ordered from Smith and Co., Calcutta, who held in readiness duplicate packets, one for each aeroplane.

Late last night the foreign Secretariat received a further telegram from Bangkok, stating that the Siamese medical authorities had at last succeeded in procuring this drug. The Wapitis were therefore stopped halfway on their flight to Calcutta. No news has yet been received of the condition of the Royal patient.

A *Reuter* message from Aden dated July 26 states:—

The Greek steamer *Hermes*, which sent out an S.O.S. signal on July 19 to the effect that she was short of coal, and that her wireless had broken down, has been found ashore off Ahwar, in Latitude 13.28 and Longitude 47.00.

The first news of the discovery was brought by a runner to Sultan Monasar Bin Ali, of Lower Aulaki, who is at present harbouring the crew. A Royal Air Force machine went there yesterday and conveyed a woman who was suffering from exposure, and the captain of the ill-fated vessel to Aden.

Arrangements are being made for the return of the crew, communication being maintained by Royal Air Force machines.

Aircraft Versus Locusts.

The report of the locust investigation sub-committee of the Committee of Civil Research states:—

We are hopeful that it may be found possible to employ aeroplanes for purposes of reconnaissance, and perhaps for the destruction of locusts. If this is to be effected, it is very desirable that arrangements should be made to secure the co-operation of the Royal Air Force in locust-inhabited countries. In any case where the Royal Air Force were able to assist in this way appropriate arrangements would require to be made to reimburse Air Votes in respect of the expenditure involved.

Our appointment synchronises with one of the recurrent outbreaks of the desert locust. Its appearance in small numbers in 1927 was followed in 1928 by an invasion on a large scale in Southern Sudan from the East, in Kenya from the North, and later in the Tanganyika territory through Kenya. In the same year there were important invasions in Palestine, Transjordan and 'Iraq. There is no evidence available regarding the probable duration of the present invasion, but judging by past experience it may safely be assumed that it will continue in 1930, and probably 1931.

High Speed Practice at Calshot.

An Air Ministry *Notice to Airmen* states:—

The R.A.F. High Speed Flight temporarily stationed at Calshot will be carrying out practice flying in the vicinity of Calshot from the date of this Notice to the date of the Schneider Trophy Contest, Sept. 7, and foreign teams will also be practising in the same vicinity from August until the date of the Contest.

The practice area is that bounded by Calshot Castle, Stone Point, Egypt Point, Hillhead, Chilling, Calshot Castle.

Pilots of civil aircraft are warned not to enter the area in question under 1,500 feet unless they are proceeding to or from the R.A.F. seaplane station, Calshot.

When high speed aircraft are practising, the following signals will be displayed from the end of Calshot Spit:—One white strip 18 feet by 3 feet as soon as the aircraft leaves the slipway. A second strip will be placed across the first when the aircraft takes off. The second strip will be removed immediately all high speed aircraft engaged in practice flying have landed.

Pilots of aircraft proceeding to the R.A.F. seaplane station, Calshot, should, as far as possible, remain outside the practice area and exercise the utmost caution in landing when the above-mentioned signals are displayed.

AEROPLANE CATAPULTS.

In the House of Commons on July 26, in reply to a question by Cmdr. Bellairs, the First Lord of the Admiralty said that no catapults for launching aeroplanes were fitted in any Japanese battleships, and one cruiser only had been fitted with a catapult,—which it was understood to be for experimental purposes.

The position in the United States was that 12 battleships were fitted with two catapults each and six had one each and would be fitted with two. Ten cruisers had two catapults each and eight cruisers building were being fitted with two each.

A MIDDLE EAST SQUADRON.—No. 14 (Bomber) Squadron, R.A.F., at Amman, Palestine. In addition to the Lord Lloyd Reliability Trophy, No. 14 Squadron has won the Proficiency Cup, the Bombing Cup, and the Musketry and Pistol Shooting Cup. The Squadron was also third in the Air Gunnery Competition. The Commanding Officer is Sq. Ldr. E. G. Hopcraft, D.S.C.

Digitized by Google

ACCESSORIES AT THE AERO SHOW.

[This report is written in the present tense, as if the Show were still in being. In this way a better sense of continuity is given to the narrative.—C. G. G.]

THE AERONAUTICAL AND PANEL PLYWOOD CO. LTD. Stand No. 1.

The stand is built entirely of this company's aircraft plywood, "Mallite," and forms a good display in itself. All forms of plywood panels are shown, birch and mahogany for structural work, balsa—that peculiarly light wood—for fairings and cabin linings and various decorative panels for cabin doors and internal decoration.

A wide selection of made-up parts of aircraft structures is shown, ranging from gun-ring deckings to wing ribs.

Fireproofed and metal-faced plywood is also shown.

A large block of balsa wood in the front of the stand enables those interested to test its extraordinary lightness.

A specimen dashboard in figured walnut, used for the Civilian Coupé, shows how use may be made of such decorative woods to replace the more ordinary mahogany.

THE ANGLO-AMERICAN OIL CO. LTD. Stand No. 30.

"Pratts Spirit advertised with Art," best expresses the Anglo-American Co.'s stand. Gone are the ubiquitous Petrol Pumps and cans of lubricating oil, and instead they have arranged a series of really delightful pictures of representative aircraft, displayed so cunningly that they appear to stand out and give one a sort of stereoscopic effect.

The aircraft are chosen to show that Pratts Spirit has been used to perform every kind of work from Records to taxi-work, and, moreover, with aircraft of all Nations. The centrepiece showing two R.A.F. fighters diving through clouds is certainly a most artistic display.

The Anglo-American Co. were the first to develop the T.E.L. doped fuel in this country and it is worth noting that the consumption of this fuel in the U.S.A. was last year equal to the total consumption of all motor spirit in this country. It has very definite advantages over petrol-benzol mixtures for aviation use, one of these being that the freezing point is not brought up higher.

Also, for trips to outlying parts of the World where only straight petrol is obtainable, engines which are designed for petrol-benzol mixtures cannot be made to run satisfactorily. But when T.E.L. doped fuel is used it is a simple matter to carry the dope in the aircraft and to mix it in the fuel as one goes, as the quantity used is so very small. In war time benzol would all be used for explosives, but the source of supply of T.E.L. would still remain.

Conforming to the growing tendency to use mineral oil for engines in aircraft, this company has now started to retail their own lubricating oil in all the necessary grades, but, as has been said, no mechanical demonstrations of its properties are to be seen on this stand, and one is left to assume, quite rightly, that they are of the same high class as the artistry of the stand.

THE A.C. SPARKING PLUG CO. LTD. Stand No. 31.

A range of A.C. products applicable to aircraft use is shown on this stand. It consists of sparking plugs, oil filters, fuel pumps and air cleaners.

None of these products are as yet approved by the Air Ministry, but application has been made for approval.

The Air Picture Stand.

THE AIRCRAFT AND GENERAL FINE ART CO. Stand No. 27.

Mr. and Mrs. W. E. Johns, who constitute the Company exhibiting on this stand, specialise in pictures of aircraft which are technically correct, and yet are real pictures. Last year they must have supplied the majority of Christmas Cards used by the Royal Air Force, either as Squadron or Unit cards, or for individuals. And thousands of aviation enthusiasts and people in the Trade must also have been among their customers. Mr. Johns is his own artist and printer. Mrs. Johns is also an artist, and manages the firm's office-work as well.

A large selection of pictures of all types of aircraft is shown. These are suitable for reproduction for all purposes, either in large sizes as household decorations, or in small sizes as cards (Christmas or post).

Other lines in which these illustrations play an important part are playing cards, post cards, greeting cards, calendars and all kinds of catalogues or brochures for advertisement purposes. All of which the firm produce and print themselves.

Though originally started as a side line, the sale of Air Mail

The Stand of the Anglo-American Oil Co. Ltd. in the New Hall.

Digitized by Google

Wooden Airscrews are Made Here.

Stamps and complete stamped envelopes has proved a considerable attraction and several unique specimens are exhibited, some of which have been carried on well-advertised long-distance flights.

Altogether the exhibit is a credit to its owners, who by sheer hard work, and strict attention to business, coupled in a most unusual way to true artistic sense—without too much of the artistic temperament—have made for themselves a definitely useful place in the Aircraft Trade and in the aeronautical community.

AIRCRAFT MATERIALS LTD., Midland Road, N. W. 1. Stand No. 132.

"Aircraft materials for every purpose" accurately describes this exhibit of standard components and fittings to Air Ministry and B.E.S.A. specifications.

Included in a very extensive range are 3 A1 bolts, shackles, pins, copper tubes, and various steels and alloys.

A range of 5 W.3 streamline wires are also shown.

The short end of these wires is threaded left-handed, and the long end right-handed. The wires are treated for anti-corrosion with electro-cadmium plate.

One interesting exhibit is a steel bomb-release gear with spring jaws operated by a Bowden cable, and able to take a load of 520 lbs.

THE AIRSCREW COMPANY, Weybridge, Surrey. Stand No. 129.

This pioneer firm of airscrew manufacturers are showing a varied range of wooden airscrews from the 6 foot 6 inch "Cirrus" type to the 16 feet propeller for R.101, to be fitted on the Beardmore Tornado.

The airscrews are finished in cellulose lacquer, and make an imposing display.

A Napier engine fitted with one of the company's airscrews, and a number of windmills for generating purposes, complete the exhibit.

There is interest in noting that a portion of the Weybridge works has been set aside to deal specifically with airscrews for light aeroplanes. Members of flying clubs are invited to inspect the works and see the airscrews in the course of manufacture.

THE AUTOMOBILE ASSOCIATION, Fanum House, New Coventry Street, W.1. Stand No. 156.

Private owners, and visitors to flying club meetings, are by now familiar with the valuable services performed by the Aviation Department of the Automobile Association under the able leadership of Mr. Ivor McClure.

For the unitiated these services were fully explained at Olympia. Some idea of the growing popularity and appreciation of their work can be gauged by the fact that to-day over 95 per cent. of the private flying traffic through Lympne is handled by the Association, and hundreds of inquiries are being received from abroad, notably from Italy and Spain.

An interesting feature of the exhibit is the new weather-map, which is to be installed at Heston Air Port. The map is corrected periodically from Air Ministry meteorological reports, and the recognised Air Ministry weather symbols are employed.

Members of the Association contemplating a flying tour may take advantage of any, or all, of the facilities offered by the Aviation Department.

The department undertakes the procuring of permits, carnets, and all other necessary documents. A detailed weather forecast for various places en route is supplied, and special flying maps can be hired from the department for a small fee.

These maps are of the strip type on a scale of four miles to the inch. The direct route from air port to air port is clearly marked, with the compass bearing in each direction. An alternative route is also shown, and prohibited and danger areas are marked. The route is divided into sections of ten miles. The mileage from the starting point is given, and the time taken to cover any section can be referred to a table on the cover, which will then give the ground speed.

Detailed information of the locality of aerodromes, and the facilities obtainable are also given, together with advice on hotels, and other valuable data.

The air message service is yet another useful aid to pilots, and has been approved by the Secretary of State for Air. A special message-bag, with streamers, is provided, which may be dropped near the recognised A.A. telephone boxes. The message is then telephoned to its destination. The boxes are shown on the A.A. General Flying Maps of Great Britain, and are approximately 80 in number. This service is of great use in an emergency, and serves to illustrate the valuable work being done by the Association in the interests of aviation. Such work deserves the widest support.

A map of Europe showing flying routes recommended by the A.A. is displayed, together with a map of England showing all existing aerodromes.

During the Schneider Trophy Contest the Association will take charge of the arrangements for air visitors at Hamble and Cowes aerodromes, and application for aircraft parking space should be made to the Aviation Department.

AUTOMOTIVE PRODUCTS COMPANY, 3, Berners Street, W.1. Stand No. 147.

This company has acquired the licence for the manufacture and marketing of the Lockheed Hydraulic Braking system for aircraft and automobiles. On this stand at Olympia is an aeroplane wheel fitted with the Lockheed brake, and the tail portion of a fuselage. The action of the brake is demonstrated by spinning the wheel, then pulling over a hand-lever on the fuselage, which sets the brake, and finally putting a lot of weight on the end of the fuselage. This latter action compresses the tail-skid, which applies the brake and stops the wheel from spinning.

Castor oil, denatured alcohol, and certain reagents are used for the fluid in the system. The hand-lever operates a master cylinder, which puts an initial load in the system, bringing all the mechanism to the "ready." The tail-skid operates a cylinder, which is spring-loaded to prevent over-braking. This cylinder increases the pressure, thereby applying the brakes. Once the tail is on the ground and the machine braked to a standstill, the hand-lever is released and the tail-skid places the initial load in the system. In this condition the auxiliary cylinders attached to the rudder bar come into operation, and assist in steering.

The great feature of the Lockheed system is the point that a brake operated by the tail-skid is an automatic safety device, the brakes cannot come on till the tail is down, so there is no tendency to "ground-loop," or put the machine on its nose.

The Public Benefactors.

LODGE

AVIATION PLUGS

are made in the following models:—

A20 11 m/m reach A21 18 m/m ,,	for medium compression engines.
A30 11 m/m reach A31 18 m/m ,,	for medium and high compression engines.
A40 11 m/m reach A41 18 m/m ,,	for engines of exceptional output such as Rolls F.XI.

A characteristic of all these plugs is that they will withstand overheating of the engine for short periods without any detriment.

The patented construction incorporated in the A30 and A40 designs gives a wider range of resistance to heat and oil than is obtainable in any other make of plug.

PATENT 308438.

THE AIR SURVEY CO. LTD., 39, Grosvenor Place, S.W.1. Stand No. 158.

A large mosaic of part of Borneo recently surveyed by this company is an interesting feature of this exhibit. The mosaic is on a three inch to the mile scale, and embraces an area of 600 square miles.

Stereoscopic photographs from this mosaic are also shown, and the views of the dense jungle are very impressive.

A number of aerial photographs are also shown illustrating the company's work in India and the East. Some of these are highly interesting from an archæological point of view.

ANTI-ATTRITION METAL CO. LTD., Glengall Works, Glengall Road, S.E.15. Stand No. 138.

This exhibit consists of a display of chill-cast solid, and cored, sticks, white bronze ingots, and bronze machine bearings.

The sticks are in 24-inch lengths, conforming to A.B. specification B.8.

Gun-metal and phosphor-bronze ingots of A.B. specifications B.2, and B.8, respectively, are also shown.

THE AIRCRAFT OPERATING CO. LTD., 8, New Square, Lincoln's Inn, London, W.C.2. Stand No. 187.

A comprehensive exhibit showing the work of this company is displayed on this stand and comprises mosaics, oblique photographs, and maps, as well as air survey equipment.

The mosaics shown are part of the Iraq and Egyptian surveys, and also from the recent survey of Rio de Janeiro and the Federal District of Brazil.

A very fine mosaic of Central London is also shown. This was reproduced on a poster for the Underground Railway, and is on a scale of 25 inches to the mile, and is made up of approximately 350 photographs. The photos were taken by Aerofilms, a subsidiary company, who also show examples of commercial air photography.

On this stand also is a model of the survey aeroplane made for the company by the Gloster Aircraft Company, the actual machine being on the latter's stand. This machine was fully described last week.

A special surveyor's wireless set is also shown, made by A. Graham and Co., a description of which appears elsewhere in this issue.

Other equipment shown is the well-known Williamson F.8 camera for air survey work.

ALUMINIUM (II) LTD., Bush House, Aldwych, W.C.2. Stand No. 174.

To overcome the difficulty of corrosion of alloys this firm has introduced a new process in which the alloy is coated with pure aluminium, thus forming a sort of 3-ply metal. The resultant alloy is "Alclad," specimens of which are to be seen on this stand.

Strips of this metal are shown after a sea-water test of two years' duration. Also "Alclad" 17 ST sheets to D.T.D. specification, No. 111, together with miscellaneous alloy forgings and castings are shown, including a 25 S alloy airscrew and 17 S spars.

Aluminium sheets, 17 ST alloy sheets and tubing, to B.E.S.A. specifications, together with corrugated "Alclad" sheets, contribute to this exhibit.

The production of "Alclad" 17 ST, a heat-treated aluminium-copper-manganese-magnesium alloy is an interesting development in corrosion-resistant aluminium, and is being manufactured under British Patent No. 271798.

AIRWORK, LTD., Heston Air Park, Hounslow, Middlesex. Stand No. 119.

The stand of Airwork, Ltd., contains a large-scale model of Heston Air Park, showing the buildings, hangars, and machines. The latter are shown on the ground and in the air, and are so infinitesimal that one felt that a blast from the loud-speaker might shiver them to fragments.

These models represent the three types of machine used at Heston Air Park for School and Taxi work—the D.H. Gipsy-Moth, Avro Avian, and the Blackburn Bluebird.

Round the walls of the stand are photographs of Heston Air Park, showing the Service facilities and accommodation offered.

The ambition of Mr. Nigel Norman and Mr. F. A. Muntz is to maintain a social centre at Heston for aircraft users. Visitors can be provided with private lock-ups (for their machines, *bien entendu*).

The "social centre" part of the scheme has been well to the fore during the Aero Show, as a number of exhibitors had machines stationed at Heston which were used for demonstration purposes. There was the successful Aerial Garden Party, held at Heston on the first Saturday of the Show, when 67 civilian machines turned up, and there was a big crowd of spectators.

The Park has been organised as a Club, where for an extremely low annual subscription those interested may become either flying or non-flying members. Members of private flying clubs can on application become honorary members of the Park, with the same privileges as members.

ALLEN-LIVERSIDGE LTD., Victoria Station House, Westminster, S.W.1. Stand No. 37.

In the early days of aviation Allen-Liversidge Ltd. were chiefly known as acetylene engineers and makers of searchlights and projectors. During and after the war very large numbers of these were purchased both for anti-aircraft work and for illuminating aerodromes. In recent years, however, the bulk of the trade which Allen-Liversidge have done with the Aircraft Industry has been concerned with oxy-acetylene welding equipment for use in construction of metal aircraft.

Aircraft welding demands the use of the purest possible gases if sound welds are to be obtained. The dissolved acetylene which is used in the Allen-Liversidge high-pressure portable welding equipment is dried and purified before it is compressed into the cylinders, and this purity and dryness, which are not obtained in other ways except on a very large scale, are important factors in the production of good welds.

The company also produces the Alda flare lights and tools which employ as fuel dissolved acetylene and atmospheric air. With a number of light blowpipes which are interchangeable a wide variety of different jobs, such as brazing, soldering, lead-burning, cable-jointing, etc., can be performed rapidly and efficiently.

Besides a comprehensive range of oxy-acetylene welding equipment Allen-Liversidge are showing their electric spot-welder, which is now coming rapidly into general use for aircraft work in America and will shortly be doing so in this country. It is very simple to operate and the welding successfully takes the place of rivets for a large number of the ordinary jobs. As yet it has not been found successful with aluminium.

Another application of the same principle is the electric seam-welder in this type. The welder is in the form of two copper rollers which rotate,—drawing the sheets to be welded through and completing the weld at the same time. It is in effect a continuous spot-welder.

For those interested in very fine work the new small 5-litre blow pipe should be of interest. It was really brought out for lead-burning, but is equally useful for fine aluminium work or strip steel.

Complete equipment is also shown for surface hardening, soldering, brazing and lead-burning.

AMALGAMATED CARBURETTERS LTD., Holford Works, Perry Bar, Birmingham. Stand No. 134.

The stand of Amalgamated Carburetters Ltd. shows a complete range of flow-meters, a few carburetters and a new type of Bowden wire.

Brown and Barlow Ltd., one of the associated companies, is the oldest British firm of carburetter manufacturers, and this company early in the War turned its attention to the development of accessories directly concerned with the petrol consumption of aero-engines.

When aero-engines began to be manufactured in large quantities serious trouble was experienced in obtaining the correct size of jet for the carburetter, and it was frequently found that the same diameter jets gave different discharges under the same conditions of working. The company thoroughly investigated the problem and as a result produced the Jet Calibrating Machine, which is now very largely in use.

On the successful conclusion of the tests on the apparatus the company was requested to produce a Flowmeter working on the same principle but so calibrated as to be suitable for indicating the rate of consumption, in pints per hour, of an aero-engine while on test. This was done successfully, and since then large numbers of instruments have been supplied to every country in the World where aero-engines are tested.

In this country the instruments have been installed in the test shops of practically every aero-engine manufacturer and are proving of utmost value not only for checking the petrol consumption but also in detecting many previously unsuspected troubles, among these being "hunting" of the float feed mechanism and partial air-locks in pipe lines. The latest model is known as the Flowmeter Mark IX.

This instrument is not restricted for use in testing engines on the test bench only but can be used in many other directions, such as testing the accuracy of setting of a carburetter where a variable jet is employed, such carburetters being outside the scope of the Jet Calibrating machine

Both calibrating machines and flow-meters of this type work on the same principle. They consist of a float chamber and a vertical glass tube. Obviously if the petrol is only allowed to pass from the float chamber to the glass tube, the petrol will rise to the same height in the glass tube as in the float chamber, but a venturi is introduced in which the jet to be tested is placed so that the height in the column will fall proportionately to the amount leaking through the jet. A similar sequence takes places in the flow-meter, except that the petrol passes through to the engine under test.

The new wire for Bowden cables introduced by the firm

Digitized by Google

A. AND P. LTD.—Where Tubes Are Worked Like Wires.

has the great advantage of not unwinding when cut. All ardent amateur motor-cyclists know the job of replacing a broken wire and what a knack it takes to sweat the new wire so that it does not spread. This new wire can be cut anywhere with no sweating, and each individual wire stays put.

ACCLES AND POLLOCK, LTD., Oldbury, Birmingham. Stand No. 166.

During the War the Accles and Pollock works were entirely under Government control, and in addition to the production of Weldless Steel Tubes the firm carried out a tremendous amount of constructional work.

Many improved methods of Aircraft Construction have found birth in the Accles and Pollock workshops, and a section of the staff is continually employed in carrying out tests and experiments which decide the most suitable material and methods of production for every conceivable tubular part for aircraft. Particular care is exercised in analysing and testing the material, and fatigue tests are being carried out daily.

The result of all this work is that Accles and Pollock place at the disposal of aircraft designers and builders a comprehensive knowledge of all the possibilities of tubular construction. They are always prepared to make experiments, and to place their experience at the disposal of aircraft firms who consult them.

Their stand at Olympia reflects this policy and shows the large variety of work done by this firm. It also gives some idea of their experimental work.

Among all their other activities the firm find time to produce some really startling box-spanners in 80-ton chrome molybdenum steel. A much-patronised form of exercise at the Aero Show consists in screwing the head off a standard 9/16in. steel bolt with a suitable box spanner of this material. When the writer's turn came the testing stand was wrecked, but the spanner was not even out of shape.

To return to tubes, the firm show their latest in taper-gauge axles, in stainless tube, streamlined or otherwise, and all kinds of tube in all kinds of fancy section.

They also show the special drawn-steel spars of double eight section originally produced for the Fairey Company. They do work with both kinds of stainless steel, that is, Martensitic and Austenitic. The former behaves like ordinary steel as far as quenching goes, but the latter type is like copper and duralumin—to anneal, it is first made really hot and then dropped in cold water.

A great feature of the firm's activities is the production of all kinds of webbed structures, to the customer's requirements. There are one or two examples of this work on the stand.

AUSTER, LTD., Crown Works, Birmingham. Stand No. 74.

Auster, Ltd., specialise in the production of wind-shields for aircraft, and the stand exhibits a full range of their products. There is an interesting windscreen suitable for a Short Calcutta. The features of this screen, besides the opening panels, are the adjustable sun vizors for each pilot. These can be fixed in any position up and down the panel in front of either pilot, and can also be turned through any angle. Nitra glass shields, with which the firm have been experimenting, are shown; these are made of an anti-glaze material.

BRAY, GIBB AND CO., 166, Piccadilly, W.1. Stand No. 26.

This stand advertises the fact that Bray, Gibb and Co. were the pioneers in aviation insurance brokerage, and have been actively connected with this class of business for about 20 years.

An interesting exhibit is a letter from M. Bleriot, anent this business, dated 1911, and a similar one from Mr. Cody asking for quotations.

Bray, Gibb and Co. do not necessarily only deal with any one group of underwriters but place their business to the best advantage for each particular customer.

THE BROOKLANDS SCHOOL OF FLYING, Brooklands Aerodrome, Byfleet. Stand No. 180.

Up in a corner of the Main Hall gallery is the stand of the Brooklands School of Flying which demonstrates the actual methods of flying instruction they employ. There is a portion of a Mk. I Moth Fuselage installed complete with dual control, instruments, voice-pipe and the rest, so that visitors may sit inside and see the way the whole thing is done.

All day long there is quite a procession sitting at the controls and being told what and how to do it. As a result a number of pupils have gone down to Brooklands where a trial flight of instruction can be had for £1. Quite a feature of the Show from the School's point of view have been the inquiries from old pilots who want to know how long it will take to get their hand in again. And an even better feature is the number of pilots who have arranged to take "refresher" courses. After such a course the pilot need never again get out of touch as he can always hire a machine from the School.

The School being unsubsidised is quite able to instruct foreigners and indeed makes a feature of this side of the business.

Another branch of their activities is the sale of various makes of light aircraft. They are agents for the D.H. Moth. In this connection there is interest in noting that the School is prepared to sell on the Hire Purchase System and three machines have already been sold this way.

S. F. BOWSER AND CO. Stand No. 7.

An aircraft fuelling pit is shown by Bowser and Co., and illustrates the system very clearly. A clever background gives the impression of the aerodrome and shows in the distance several pit installations in use. The hose is coiled on an easily-operated drum and is long enough to be hauled up to the largest aeroplane. The fuel is stored in underground tanks and is delivered through suitable pipes to the pit by an electric motor which is started by a vapour-proof switch in the pit itself, where it is measured by an Xacto meter which is extremely accurate, as it is calibrated to one-tenth of a gallon.

Other ordinary types of fuel pumps are also shown, such as those so widely used for motor-car refuelling.

The firm is American and has a very large trade in aircraft fuelling-plants in that country.

Oil storage tanks of various types are to be seen on the stand, both of the portable trolley type and the stand type and all have very accurate measuring devices.

A map of the U.S.A. forms the background to the stand and serves to show the large number of aerodromes in that country which are already fitted with Bowser installations.

LOUIS BAMBERGER AND SONS, 27-28, Finsbury Square, E.C.2. Stand No. 118.

This is the smallest individual trade exhibit in the show, consisting solely of a few silver spruce spars, and a selection of spruce boards from Canadian forests.

BRITISH PETROLEUM CO. LTD., Britannic House, Moorgate, E.C.2. Stand No. 170.

A model of the Persian oil-fields in the neighbourhood of Masjid-i-Sulaiman is an interesting feature of this stand.

The model is on a scale of 6 inches to the mile, and covers an area of 98 square miles, and shows the position of wells and pipe lines.

A cinema showing the production of B.P. spirit is in operation on the stand.

A petrol truck, mounted on four aeroplane wheels, for aerodromes is also exhibited. The tank capacity is 50 gallons, and the truck can be handled easily by a boy.

Standard petrol filling pumps complete the exhibit.

E. P. BARRUS LTD., 35-37, Upper Thames Street, E.C.4. Stand No. 160.

A wide range of drills comprise this exhibit. Among these is a Valve Refacer, which will reface valves from 30 to 60 degrees, round the radii on the Rocker Arms, and square off the ends of the valve stems.

A feature of this apparatus is the Split-Double Grip Collet, capable of gripping valve stems from 5-16 inch to ½ inch diameter. The chuck is held entirely within the spindle, with no part overhanging.

Valve reseating cutters can be sharpened with this apparatus, and, with the special attachments provided, 15° and 75° cutters can be sharpened.

Other exhibits include a 2.3 amp. portable electric drill, 12 inches in length, and weighing 6½ lbs., designed for rapid drilling, and a number of wrenches and drills of various types.

Digitized by Google

Hence the Verb "To Bowse."

JAMES BOOTH AND CO. (1915) LTD., Argyle Street, Nechells, Birmingham. Stand No. 165.

This stand is built up entirely with duralumin and aluminium, and contains a variety of specimens of these metals.

The rails in front of the stand are duralumin strips twisted spirally into tubing and rivetted. This tubing is being used on R.100.

A number of spar sections in duralumin are shown, as well as bars, strips, and rods in varying sizes and shapes.

Heat-treated duralumin sheets to B.E.S.A. specification, up to ten feet in length and four feet in width, are here shown.

Other duralumin exhibits are tubing from four inches diameter down to one-eighth inch, solid drawn, also screws and rivets, and drop forgings for Fairey airscrews. There are also some specimens of duralumin spinnings, and anodically-treated tubing.

Y alloy forgings, copper tubes, sheets, and extended rods, and cupro-nickel tubes for condensers are further exhibits on this stand.

THE BRITISH PISTON RING CO. LTD., Holbrook Lane, Coventry. Stand No. 137.

A range of Brico piston and scraper rings made from centrifugal castings are displayed by this firm. These rings are specially manufactured for aircraft. The metal has a high elastic value, and has a mirror-like flat surface on the periphery and sides.

The scraper rings are of the Scraypoil pattern, and of ground and drilled type.

Lapped gudgeon pins, and a number of centrifugal castings, are also shown.

THE BRITISH THOMSON HOUSTON CO. LTD., Alma Street, Coventry. Stand No. 173.

B.T.H. magnetos have a World-wide reputation, and are to be seen on many aero-engines and motor-cars.

On this stand are shown aero magnetos for every type of engine of from one to sixteen cylinders, of both Rotary Armature and Polar-Inductor types.

Hand and electric Inertia starters are also displayed.

The "Eclipse" Hand Inertia starter has been designed for large engines, and its essential principle is the storing of energy in a small fly-wheel by running it up to a high speed and using this energy in rotating the engine crankshaft, through a multiple gear reduction, torque overload release, and driving jaw.

This starter has a high initial engine cranking speed and about 80 r.p.m. is attained in from 15 to 30 seconds. It can be electrically driven by bolting an electrical attachment to the starter flywheel housing, which accelerates the flywheel to operating speed.

Also on this stand is a 24-inch revolving beacon, of 2,000 candle power, fitted with 1,000 watt interchangeable lamps, for aerodrome illumination.

BENDIX-PERROT BRAKES LTD., Westwood Road, Witton, Birmingham. Stand No. 131.

The exhibit of Bendix-Perrot Brakes Ltd. shows the latest type of wheel and incorporated brake made by the firm, together with an assembly of the detail parts.

The advantages claimed of these brakes are:—They reduce the run after landing to a minimum enabling safe landings to be made in small areas, they permit an aircraft engine to be warmed-up without the use of chocks, they provide perfect control on the ground when separately operated, and they permit of the use of a tail-wheel instead of a tail-skid, and thus avoid damage to aerodromes.

The wheel has an electron hub with self-lubricating bronze bushes. To this hub are attached light alloy side-plates carrying the rim. In one of these side-plates is the steel brake-drum.

The brake itself is of the two-shoe servo stype. There are two shoes made from light alloy forgings. These are hinged together and pivotted to a fulcrum only. The other free end has renewable rollers against which the cam works.

As the shoes are circular on their outside face a very even bearing is obtained on the drum, with a corresponding reduction of wear on the brake-lining. This type of brake is fitted by the De Havilland, Handley Page, Blackburn, Westland, Avro, and Bristol Companies.

Brakes That Do The Stopping.

Digitized by Google

BOYRIVEN, LTD., 9, 10, and 11, Torrington Place, W.C.7. Stand No. 52.

This firm has been engaged in the supply of interior furnishing materials to the motor trade, and are now showing their initiative by preparing to supply the same market in the aircraft industry. One of the features of the Aero Show is the development of comfortably-furnished cabin-aircraft for passenger-carrying, so no doubt a firm which can supply the material for making aircraft cabins comfortable and attractive should do well.

Besides specimens of interior fabrics and leather-cloth which are used to form part of the decoration scheme of their stand, Boyrivens are showing their new Beclawat horizontally sliding window. This is made in two parts, a fixed panel and a sliding glass. The fittings are of duralumin and suit all types of safety glass.

The feature of the window is the ease of fixing. The fixed glass is simply held in rubber channels inserted in grooves cut in the fuselage framework.

The sliding glass is held in a light frame with rubber-lined channels. This frame slides over a U-section bottom rail, and at the top is guided by a channel. The top and bottom rails are very easily attached, as they are simply screwed to the fuselage.

The design is obviously good for rapid assembly in quantity production, and the method of attaching the rails to the framework ensures a water-tight joint.

BROWN BROTHERS, LTD., Great Eastern Street, E.C.2. Stand No. 70.

Brown Brothers are famous for supplying from stock any aircraft accessory that anybody can possibly want. On their stand can be seen in mild steel, stainless steel, high-tensile steel, and duralumin, all the miscellaneous parts to A.G.S. requirements and otherwise which Brown Brothers are ready to supply at any moment.

One cabinet contains a collection of pieces made to aircraft manufacturers' special requirements, ranging from engine parts to details for parachutes.

The firm have recently brought out a new form of copper ring or gasket for sparking plugs. These are generally made of copper, interlined with asbestos. The new type is also of copper, but is tubular in section. It is expected to be much in demand.

Neat equipments of Black and Decker valve-grinding machinery are to be seen on the stand. The valves are faced up by a small grinder attached to an electric motor, the valve meanwhile being rotated by a flexible drive. The seating-angle can be varied.

For grinding valve seats and cleaning out valve guides a portable electric motor is supplied, to which can be attached spindles carrying reamers for refacing the seat, grinding tools, and wire brushes for cleaning the sludge from the interior of the valve guides. Equipment of this kind appears to have a place at aerodromes which service machines for the private owner and the like.

BRUNTONS, Wire Mill, Musselburgh. Stand No. 47.

Bruntons are famous in the aircraft industry for the supply of streamline wires, and all the latest types of this form of their activities are illustrated on their stand. This firm, which began supplying tie-rods for use in aeroplanes in 1907, is now producing streamline wires in stainless steel, samples of these being exhibited on the stand. Bruntons are also showing stainless steel rope and stainless steel fittings, such as turnbuckles.

Exhibits of particular interest on the stand are Beacon Tru-Lay cable and Beacon Tru-Loc fittings. As is well known, wire rope or cable of any size, on being severed, immediately flies into its individual components, unless first sweated or sewed with twine or fine wire. The new Beacon Tru-Lay on being cut remains in position.

This result is obtained by passing the wire over a special former so that the wire is actually made in with its correct twist.

The Beacon Tru-Loc system is a remarkably neat and effective manner of attaching fittings to the ends of cable.

The cable is introduced into a bored hole and the fitting is then swaged onto the wire. In test the wire always breaks before it becomes detached from the fitting.

Tru-Loc fittings to the number of 11,500, and some 17 miles of Tru-Lay wire rope, have been used in the R.100, which shows the reliance that is being placed in these new devices.

Bruntons also specialise in the production of Bright Cold-Drawn Special Shaped Steel Sections. Such shapes frequently replace machined sections with considerable profit to the user, owing to the reduction or elimination of machining.

BRITISH CELANESE LTD., Celanese House, Hanover Square, W.1. Stand No. 152.

Various articles treated with this firm's cellulose acetate dopes and varnishes are displayed here, including a fine model of the Supermarine S.5 seaplane.

Specimens of Celastoid sheets for goggles, windscreens, and side windows are also shown. These sheets are made in 40th, 60th, and 80th inch thickness, and comply with Air Ministry specification. They are extremely pliable, are non-inflammable, and do not discolour.

"DECORATIONS WILL BE WORN."—The Birmingham Medal Co.

Another product of this firm shown is Celastine moulding powder for the making of dials, gauges, clocks, and numerous other accessories.

Celastine is also supplied in moulded sheets and rods.

BAKELITE LIMITED, 68, Victoria Street, S.W.1.

This exhibit shows the variety of materials which can be made from Bakelite Synthetic Resin. These include mouldings for aircraft instruments, laminated fabric for windmills, dashboard, panelling, link insulators, and other fittings and products.

Bakelite mouldings are used in the production of hundreds of every-day commodities, and it can also be supplied in liquid form for varnishing.

THE BRITISH ALUMINIUM CO. LTD., Adelaide House, King William Street, E.C.4. Stand No. 165.

Further examples of aluminium products can be seen on this stand, which adjoins that of James Booth and Co., and is similarly built up.

Here are shown aluminium ingots, and 2L5, 2L8, 3L11 alloys.

Plates and sheets in pure aluminium, and in silicon alloy, aluminium tubes, sections, rods, and rivets, and alloy L32 rods, are all contained in this exhibit.

THE BIRMINGHAM MEDAL CO LTD., Summerhill Terrace, Birmingham. Stand No. 184.

A very fine collection of model aircraft in silver and metal is a feature of this exhibit. The models are of various sizes, and are constructed to scale. Several types of light aeroplanes are included.

Other exhibits include trophies, plaques, mascots, advertising devices, and enamelled badges of every description, including those of some of the Flying Clubs.

D. H. BONNELLA AND SON LTD., 46-48, Osnaburgh Street, N.W.1. Stand No. 190.

Standard A.G.S. parts are the principal features of this exhibit, and include ignition fittings for gas starters, cable fittings for earth bonding system, lighting and wireless fittings, insulators and terminal blocks for high and low tension circuits.

A number of electric light bulbs and ceiling lights are also shown for the illumination of aircraft cabins and motor-cars.

There is also a dimmer cockpit lamp, made to Air Ministry design, which can be adjusted to any angle, and the lighting controlled by a rheostat. The lamp is fitted with a red glass giving a short actinic ray.

CELLON LTD., Kingston-on-Thames. Stand No. 23.

Cellon Ltd. are showing a wide range of cellulose finishes for all purposes.

Fabric panels and covered surfaces show the standard doping schemes for aeroplane wings and other fabric-covered surfaces, schemes which are suitable for either Service or civil aircraft.

Several new effects are also shown which should be particularly attractive to private owners, who wish to finish their machines in distinctive colours. The bronze metallic effect which is shown to so much advantage on the Hawker

Digitized by Google

Where The Word "Dope" Was Invented.

Tom-Tit may be had in any colour, and gives a particularly luxurious-looking finish.

Specimen panels are also shown of another type of finish called the "crackle." This may also be had in any colours and gives the effect of artificial leather. It is formed by applying two colours the top one having the property of immediately contracting and drying with a network of cracks through which the under coat may be seen. The size of the cracks may be controlled by applying the top coat before or after the bottom coat is dry and also by varying the thickness of the top coat.

Other panels show the "Marbled" effect. Its name is self-explanatory and it is really surprising how the marbling appears to stand out raised above the surface when actually it is flat.

Besides dopes, a range of Cerric lacquers for all purposes is shown. This includes a pigmented cellulose lacquer for finishing wooden airscrews, and a transparent lacquer specially for duralumin airscrews. A Fairey-Reed screw is shown finished in this way. A black lacquer for all steel parts, which have until recently been stove-enamelled, and a grey lacquer for duralumin parts are also shown. A duralumin rudder is shown finished in this style.

For wood both pigmented and transparent lacquers are made and a range of specimen plywood and solid panels of all kinds show how attractive this type of finish can be. It has a great advantage over French or other polishes in that it is impervious to everything and when used for furniture a quick polish with a wax polish will invariably restore the surface to its original state. It should have plenty of scope for internal use on cabin furnishings and is easier for unskilled labour to obtain a good finish with than is the normal type of shellac polish.

Pigmented lacquers in all colours are also available for external use and many aircraft which are built of plywood are finished in this way. The result is far more durable than paint. The Saunders "Cutty Sark" is an example. Here the wing is plywood and the hull duralumin, and both are finished with the appropriate type of Cerric lacquer.

Masonite panels are one other line which Cellon are showing. These are panels made from compressed wood fibre and are said to be more durable than plywood. Their weight, however, would appear to preclude their use, at present, for aircraft construction, though they have, it is said, proved admirable for "Speed-boats" and stand up to the vibration where plywood has broken down.

ALAN COBHAM AVIATION LTD., 150, New Bond Street, W.1. Stand No. 140.

After flying to the four corners of the World in search of Empire air routes, Sir Alan Cobham is placing his experience at the disposal of any Government, or individual, requiring advice on air-ports, air-parks, or any commercial aviation enterprise.

At his stand at Olympia can be seen a map of the World showing the routes flown by Sir Alan Cobham, together with a map of Britain showing the centres now being visited by him to make the youth of this country air-minded.

Some excellent mosaics of New York and London are also displayed on the walls, as well as an oblique view of New York from 6,000 feet.

The originals of the two winning drawings in the air port design competition held by the Royal Institute of British Architects are here shown.

THE CHLORIDE ELECTRICAL STORAGE CO. LTD., Clifton Junction, near Manchester. Stand No. 196.

This company, famous for their "Exide" batteries, are showing some special aircraft batteries for high and low tension wireless use, and also for engine starting, and lighting.

Special 25 amp. cells have been evolved for aircraft. They have very thin plates, yet give a heavy discharge.

Batteries of this type were used by Sir Alan Cobham in his tour round Africa in the Short Singapore.

A demonstration of the new Keepalite emergency lighting system was given. This can be used on either A.C. or D.C. mains, and is instantly operated by a change-over switch.

This apparatus is a useful alternative lighting system in case of failure of the ordinary supply, and is invaluable for hospitals and other institutions, as well as aerodromes and factories.

CHANCE BROTHERS AND CO. LTD., Lighthouse Works, Smethwick, Birmingham. Stand No. 139.

Aerodrome floodlights and beacons are the specialities of this company, and their exhibits are both interesting and varied in character.

In the Main Hall Gallery is displayed a 16,000 c.p. floodlight, which can be either fixed in position, or mounted on a lorry or a hand-cart.

The lantern is fitted with lens of 500 m/m. focus, covering 180°, and is illuminated by a 10 k.w. gas-filled lamp with special filament. A ventilating fan is fitted in the roof, and the floodlight is mounted on three screw-jacks, to regulate the elevation of the beam.

An unattended beacon, giving a double flash every 7½ seconds, is also shown. The illuminant is acetylene, supplied from a cylinder of "dissolved" gas. A "Chance" light valve, automatically lighting and extinguishing the lamp night and morning, is fitted on top of the lantern. The intensity is 1,250 c.p., and the light can be left unattended during a period from 12 to 14 days for each cylinder.

Electric aerodrome boundary lights showing red flashes are also included in the exhibit, together with a portable light to mark danger points. This is also fitted with an automatic flasher. The illuminant is acetylene gas fed from a cylinder slung beneath the light.

Another interesting exhibit is a model of a lighted wind-indicator, which can be mounted on a hangar or mast. It consists of a revolving white T for day use, and is outlined by lights at night.

Samples of "Calorix" glass for hangar or workshop roofs in hot countries, which exclude 80 per cent. of the sun's heat, while transmitting about 65 per cent. of its light, conclude the exhibit.

On Short Bros.' stand is shown a Fourth Order flashing aerial lighthouse with a lens of 250 m/m. focus, consisting of three faces, each covering 120°, carried on a mercury float pedestal, and revolved by electricity.

The illuminant is a 1 k.w. gas-filled electric lamp, with an automatic lamp-charger. Also on this stand is an "Austinlite" automatic electric generating plant, which can be started or stopped either by a time-switch, or light-valve.

The apparatus consists of two generating plants, and is so arranged that either can be used to light the beacon, or they can be run alternately.

A system of signals is arranged to give warning of any failure.

Digitized by Google

COOPER'S MECHANICAL JOINTS LTD., Manor Works, Lower Kennington Lane, S.E.11. Stand No. 145.

Cylinder-head gaskets are the principal exhibit of this firm, and their products are widely used in the aircraft industry.

Two types of packings are shown, namely Oakenstrong, a vegetable-fibre jointing, and Kentonite, laminated with cork.

Oakenstrong is petrol- and oil-proof, and although it contains no rubber it is very resilient, and does not lose its elasticity.

A third packing, combining the essential features of both Oakenstrong and Kentonite, has been produced. This is Tantonite, composed of laminated cork, sandwiched between Oakenstrong.

This firm also exhibits washers and shims, the latter being composed of laminated brass strips, each 2/1000 of an inch thick, soldered together, which can be peeled off as desired.

THE CAXTON NAMEPLATE MANUFACTURING CO., 11, 13, and 15, Rochester Row, S.W.1. Stand No. 79.

The Caxton Nameplate Manufacturing Co. make plates of various kinds, such as instruction plates or wiring diagrams for aircraft. The materials used are generally ivorine or metal. The company specialises in machine engraving and dividing for the faces of precision instruments and drawing office accessories.

ROBERT W. COAN LTD., The Aluminium Foundries, Coan House, Duncan Street, N.1. Stand No. 150.

It was in 1893 that Mr. Robert Coan first became interested in aluminium, and five years later he began to manufacture this metal. To-day his business has assumed gigantic proportions, and his products are now in universal use.

At Olympia are to be seen aluminium castings of every description for aircraft work, as well as samples of sand and die castings.

An interesting exhibit is a 36 inch diameter die cast Scarff Gun Ring. These rings were supplied to the Air Ministry during the War, and over 20,000 were delivered to entire satisfaction.

Various alloys are also shown, including "Coanalium," a special alloy for marine work. Specimens of this metal are exhibited after undergoing a six-months' sea test.

Castings for out-board motor-boat engines are also displayed. One wonders if these are intended for Short Bros.' floats, which ought to make excellent speed boats.

THE DUNLOP RUBBER CO. LTD. Stand No. 32.

Dunlops are keeping up with the latest developments, and more than 54% of the exhibits in the Show are fitted with their latest wired-type tyres.

The chief object of interest is their duralumin disc wheel, which may be supplied with or without brakes. The hub casting is either aluminium or electron.

For braking the electron hub with a cast-iron liner comes a trifle lighter than the aluminium hub with a thin steel liner. The rim is of special section extruded duralumin and the duralumin side-plates are arranged to butt up against a lip on the rim so that the loads are taken direct onto the side-plates and not through the rivets, which are countersunk on the inside of the rim.

A special form of rubber cap fits over the tyre valve and prevents any water from entering the wheel when it is washed down or in rain.

Special pneumatic cushions of generous proportions are also shown, as are specimens of the rubber hose made by the associated companies.

The tyres shown range from a tiny wheel designed as a tail-wheel to the giant wheel over 7 ft. dia. used for the Beardmore Inflexible.

The stand itself and the arrangement of the tyres on it are a work of art. In its massive proportions and rugged strength it recalls a Stroheim Kinematograph effect. There is something of the mechanical ruthlessness of "Metropolis" about it. And all this must have a psychological action on the possible or probable customer and inspire in the firm's products that confidence which they deserve. The designer of the stand is to be congratulated on his originality.

DESOUTTER BROTHERS LTD., The Hyde, Hendon, N.W.9. Stand No. 120.

The main feature of this exhibit is the Desoutter Pneumatic Drill, Screwdriver, and Spanner, a full description of which was recently published in THE AEROPLANE.

Briefly, the mechanism consists of a five-cylindered motor, driven by compressed air, with its cylinders disposed symmetrically around a central axis. Within each cylinder is a piston, which moves on a spiral-faced cam rotating about the central axis. There being five cylinders and pistons the cam is continually rotating, and there are always at least two pistons on the power stroke and two on the exhaust stroke.

The drill can cut holes up to 3-16 in. in mild steel, and up to ¼ in. in brass or aluminium. The air pressure required is from 80 to 100 lbs. per sq. in., and the air consumption is 4 cubic feet per minute. The speed of the drill can be controlled up to 2,400 r.p.m.

The dimensions are: Length, with quick detachable coupling, 7 3-8 in.; weight, 1 lb. 1½ oz.

There is also a geared model of this drill with ratios of 3½ to 1 and 6 to 1.

A number of standardised die sets are also shown on this stand.

ALEXANDER DUCKHAM AND CO. LTD., 6, Broad Street Place, E.C.2. Stand No. 181.

A striking demonstration of the low freezing-point of Adcol lubricating oil is shown here. This well-known lubricant is run through snow-covered pipes at a temperature of approximately 20° below freezing point.

This oil is now sold in special tins with a telescopic spout to facilitate the filling up of tanks.

A cleansing preparation for the hands is being produced by the company.

A STROHEIM EFFECT.—The impressive Dunlop exhibit.

Digitized by Google

THE ENGLISH INSTRUMENT AND GAUGE CO., LTD., Aircraft Depot, Airport of London, Croydon.
Stand No. 176.

This company is connected with A.D.C. Aircraft, Ltd., and have the advantage of an approved inspection staff, so that all instruments can be despatched straight from the factory without undergoing inspection at Kidbrooke. This firm is specialising in the production of instrument panels for commercial aircraft, including light aeroplanes, and these panels certainly look attractive.

One of the ingenious devices incorporated is a flexible winder to the watch, which projects behind and parallel to the dashboard, extending into the cockpit. It has been made flexible to avoid breaking by the pilot's knees.

All types of aircraft instruments are shown by the firm, including air-speed indicators, revolution counters, pressure gauges, thermometers, cross levels, inclinometers, time of flight clocks, watches, compasses, and other navigating instruments.

THE ESSEX FIRE EXTINGUISHER CO., LTD., 20, Essex Street, Strand, W.C.2. Stand No. 177.

The Essex Fire Extinguisher can be operated with one hand, and will extinguish a petrol fire in a few seconds. The extinguishers have been adopted by the British Air Ministry, and are used by the British Air Lines. The stand of the company exhibits the various types of extinguisher produced by the firm, together with two other interesting pieces of machinery.

The first of these is the "Hancock" oxy-coal-gas steel-cutting and profiling machine, which is being demonstrated on the stand.

This machine, using ordinary coal-gas and oxygen, will cut 8in. thick metal at the rate of 3in. per minute, for a cost of 11d. per foot. The cut is extremely smooth and very narrow.

The 26 model has a cutting area of 60in. by 30in., and will operate over any area within these limits. The apparatus consists of a lower frame supporting the material to be cut and a system of levers supporting the torch. Over this is a table 60in. by 30in., where a pattern or blueprint of the required shape to be cut is placed. On this table is the tracer, which controls the movement of the torch.

Where the tracer moves, the torch follows. The tracer is driven by 1/50 h.p. motor to ensure a steady feed, the hand controlling the direction of travel, unless the automatic head is used, when the tracer will guide itself round a template time after time for repetition work.

The cutting burner has a patented remote control which governs the heating and cutting oxygen by a single lever. This arrangement eliminates the necessity for preheating for each individual cut, and ensures economy in the consumption of oxygen.

The machine will tackle any cutting job, and during the Show some tools were cut from tool steel in 3 minutes for the Hawker Company. Spanners can be speedily cut out, and rings of narrow gauge cut so truly, they appear to have been turned.

The second piece of machinery is a portable pneumatic power-shear, developed by Mr. Leigh Mossley and Mr. Hancock, for cutting away material in the event of a crash. The tool weighs fifty pounds, and can be carried by one man. It is designed to be carried on a fire-tender with 30ft. of hose, so that it can be rushed to the scene of the accident. The machine cuts through any material without sparking, so that there is no chance of igniting petrol fumes.

The cutter consists of a sturdy steel frame, which has a grip for the operator at one end and a fixed knife at the other. In between is the cylinder, which travels over the piston and along guides on the frame. The other knife is carried by this cylinder. The apparatus is being demonstrated all the time at Olympia. High-tensile steel spars 4in. deep are sheared through in a few seconds. After a hundred such cuts, the shear cut through a piece of paper as smoothly as would a razor-blade, a convincing demonstration of the cutting edges of the shear.

THE EDUCATIONAL SUPPLY ASSOCIATION LTD., Esavian House, 171-181, High Holborn, W.C.1.
Stand No. 148.

The "Esavian" principle of folding and sliding doors is demonstrated on this stand. These are designed for any type of building, and can be constructed to any size.

During the exhibition inquiries for 80 feet high doors were made.

The doors fold in leaf form, mounted on ball bearings, and are fitted with a winding gear, which can be operated by one man.

A number of these doors, 32 feet high, and with a span of 70 feet, have been installed at Halton aerodrome. The door being demonstrated on the stand is of four leaves standing 19 feet high.

The firm has been constructing hangar doors for aerodromes since 1918. Its title suggests a book-shop rather than an engineering shop. But when one looks at an aeroplane hangar one realises that it is merely a very large version of a book-case with sliding or folding doors. And the development of the book-case door is precisely what brought about this curious addition to the firm's original occupation, which was the manufacture of furniture for schools and colleges.

THE UNITED STEEL COMPANIES, LTD., 17, Westbourne Road, Sheffield, and
SAMUEL FOX AND CO., LTD., Stocksbridge Works, Sheffield. Stand No. 75A.

These two firms content themselves with two cabinets, in which are displayed steels of all kinds, in all shapes, for aircraft purposes. There are raw materials such as alloy steels, stainless wire and strip, and high-tensile steel in wire and strip. There are also forgings for crankshafts and connecting rods. The cabinets are designed to indicate the type of work undertaken by these firms.

HARVEY FROST AND CO. LTD., 148-150, Gt. Portland Street, W.1. Stand No. 141.

This firm is well known in the motor industry for its garage equipment, and its activities have been extended to the aircraft side. On their stand are two exhibits of interest to the aviation community.

One is an aero-engine clamp for any type of engine. The engine can be turned to any angle, and can be worked on without having to overhang gears.

The other exhibit is a bomb-jack with a capacity of 3½ tons, operated by a powerful screw gear.

Another accessory is a skate for either wheels or tail-skid, to facilitate the movement of aircraft in confined spaces.

A wide range of garage equipment is included in the exhibit.

THOS. FIRTH AND SONS, LTD., Norfolk Works, Sheffield.
Stand No. 78.

Thomas Firth and Sons, Ltd., are well known as steel-makers to the aircraft industry, and especially famous are their rust- and corrosion-resisting steels. On their stand are specimens of special steels in the form of finished components such as engine parts, gears, stainless streamline struts, and other parts.

The firm feel that the Aero Show offers a very good opportunity for a real discussion between the aircraft industry and its suppliers as to how they can best work together. The firm have therefore endeavoured during the past ten days to find from their various clients what are their views and requirements.

No doubt the results of this co-operation will be evident before long, when the firm will perhaps produce a high-tensile stainless steel with the virtues, as far as the shops are concerned, of mild steel!

GRANT AND WEST, LTD., 17, South Street. E.C.2.
Stand No. 192.

Demonstrations are here given of "Flinso" aluminium soldering. This preparation is supplied in powder form for sheet work, or in stick form for cast work.

The soldering process is extremely simple, the powder being placed on the metal, heated to boiling point, after which the compound vapourises, and the operation is complete, resulting in a strong joint.

Specimens of "Flinso" tinning compound, which cleans and tins all metals in one operation, Selck metal cementing powders, and rust removers, are also shown, together with Klincha patent belt-fasteners.

THE GLACIER METAL CO., LTD., Ealing Road, Alperton, Middlesex. Stand No. 50.

This company was founded in 1899, and to-day is one of the largest makers of bearing metals in England. Their works are devoted exclusively to the manufacture of *Glacier* bearing metals and finished bearings.

ALFRED GRAHAM AND CO. LTD., St. Andrews Works, Slough. Stand No. 130.

It seems a far cry from totalisators to wireless equipment, yet the makers of the famous Amplion wireless components have recently secured £100,000 contract for totalisators. Alfred Graham show on their stand at Olympia the public speech and band repeater equipment which produces the musical and other noises that are heard all over Olympia during the day.

Apart from this and of great interest to the Aircraft Industry are four sets of wireless equipment. The first of these is a small receiving set for installation in a light aeroplane. This type is known as G.A.6 and is very compact.—weighing 3½ lbs. The design has been produced to aid the pupil during his early solo stage, the idea being that the instructor can still send winged words of wisdom to the pupil alone in the air.

The next set on the stand is the G.A.3, which has been specially designed to meet the requirements of the Aircraft Operating Co. Ltd., and weighs 120 lbs. The set has been designed for the short wave transmission and reception of telegraphy only. Great care has been taken to keep all

Digitized by Google

The Graham G.A.1 Aircraft Wireless and Direction Finding Set.

units down to a "one-boy" load (about 60 lbs.). The set is not for use in the air but has been designed for transport by aeroplane and use at outlying bases and advance posts.

There are seven parts,—the receiver and transmitter, the main generator, the accumulator, the charging generator, the bicycle, the aerial and earth system and a box of spares. The "bicycle" is really a misnomer as it has no wheels. The whole set is driven off an alkali-type accumulator which is charged from the charging generator driven from the "bicycle." The idea being that a "boy" (or coolie) is mounted on the saddle and told to paddle like blazes. For every hour's working two hours of pedalling are necessary,—and what will the boy do when after two hours of pedalling he finds himself at the same spot?

The firm show a medium wave equipment for aircraft which is attractive both because of its low weight and compact size.

The receiver unit weighs 6 lbs. ½ oz., and this includes complete direction-finding gear. The transmitter is very robust, the front panel opens downward and comes away with the base-board, permitting attention to the interior in the air should this be necessary. The control unit is very neat, and is arranged to permit the reception of in-coming signals by pilot and observer, who can also converse with each other.

In this conection it is worth noting that the microphones are sewn in the flying helmets just over the cheek. All the condenser dials and the like are fitted with a locking device so that they remain set and do not shake off a setting because of vibration.

Finally the central feature of the stand is a ½ k.w. Air Port equipment which will be installed at Heston Air Park.

The set can be used for telephony, or continuous and interrupted continuous wave for telegraphy. The whole outfit is driven off the mains and there is no moving machinery. The weight is so low that the equipment is quite within requirements for the latest type of large rigid passenger-carrying airships. Direction-finding is incorporated in the receiver.

ALFRED HERBERT, LTD., Coventry. Stand No. 58.

Alfred Herbert, well-known tool-makers of Coventry, show on their stand a range of tools of interest to the Aircraft Industry and also examples of the Parker Kalon Hardened Metallic Drive Screws. These are a special form of screw which is suitable for making fastenings to cast-iron, steel, aluminium, bakelite, and similar material, without the necessity for first tapping the hole.

One of the features of the stand is the collection of Coventry collapsing taps and Coventry self-opening die-heads. These tools are widely used in the quantity-production of nuts and bolts for the aircraft industry. To gauge such work accurately the Wickman Thread Calliper Gauges are used, and there are a representative range of these gauges on the stand.

THE HOFFMANN MANUFACTURING CO. LTD., Chelmsford, Essex. Stand No. 179.

On this stand are some interesting exhibits showing the uses in aircraft-production of Hoffmann bearings. Among these is a Napier Lion crankshaft and airscrew shaft. Reduction gears for the Bristol Jupiter and Rolls-Royce Condor engines, all fitted with Hoffmann bearings, are shown.

Here also can be seen steel balls of every conceivable size, including the smallest ever made. These are 1-32-inch in diameter, and a small glass tube on the stand contains 5,760 of them. These balls are turned out to within 1-10,000 of an inch of standard size.

Roller gauges to N.P.L. certificate of accuracy are also included in this display.

HENRY HUGHES AND SON LTD., 59, Fenchurch Street, E.C.3. Stand No. 84.

The range of instruments for air navigation shown on the stand of Henry Hughes and Son is extremely large. It comprises compasses of all kinds, such as the latest military patterns for pilot or observer, an airship compass, a special type developed for the Marchese de Pinedo, one of the type used by Sir Alan Cobham, compasses for light aeroplanes, air sextants, windgauge bearing-plates, navigating bomb-sights, chart holders and height computers. There are also numerous other instruments for allied purposes, such as the Schilovsky-Cooke turn-indicator.

Mr. Hughes is very definitely of the opinion that no compass is really safe unless it has an aperiodicity of 70%, and in developing compasses for the light aeroplane this point is always borne in mind.

The latest compass for the private owner and amateur pilot is a very neat device known as the 7/29. The scale is vertical and clearly visible a yard or more away. The card is horizontal but is read by means of a periscopic device or magnifying prism which only shows the portion of the card which is adjacent to the actual bearing. The instrument may be illuminated either by daylight or electrically.

Perhaps the most interesting exhibit on the stand is the Holmes Master Compass. As shown this compass is arranged for use at sea and is designed to operate a number of distant compass cards from the one master compass. The interest lies in the fact that next year Henry Hughes and Son will produce a course indicator working on the same principle for use in light aircraft and also a similar device for large aircraft.

In the first place the pilot sets the compass to a definite bearing and then concentrates on the indicator dial which consists of a pointer placed in the centre of a quadrant. Should the pilot deviate from the course the pointer will swing from the central position an amount approximately proportioned to the deviation from the course.

The same applies to the arrangement for large aircraft. In the latter case however the navigator has the compass from which he can obtain actual bearings which saves him from having to memorise a bearing, his concern will be only to keep the indicator needle central.

The electrical mechanism is particularly robust. There are no brushes, the system working by resistance variations in two circuits inside the compass-bowl.

HUGHES JOHNSON STAMPINGS LTD., Mill Lane, Langley Green, Birmingham. Stand No. 199.

This firm are showing a number of drop-forged castings in magnesium and aluminium alloys. The most interesting of these is a drop-forged airscrew-blade in duralumin.

The blades are forged separately, the original dies being sunk from steel blocks weighing about two tons, and measuring 66 inches by 24 inches.

The blocks are shaped and planed for the removal of the outer rough forged surface, and the production on the face of the block of the contour of the blade. Next follows the die-sinking process. The roughly forged piece of duralumin is then placed in the drop hammer between the dies, after being heated to forging temperature.

Also on this stand can be seen a number of valves made of "cobalterom" steel, to DTD6 specification, for aircraft engines.

A number of duralumin castings used to support the cross-section spars in the frame girders of H.M. Airship R.101, are also included in the exhibit.

THE HOYT METAL CO. OF GREAT BRITAIN, LTD., Deodar Road, Putney, S.W.15. Stand No. 68.

When one thinks of bearings, one thinks of Hoyt. This company's stand shows samples of their famous *Number Eleven* grade of antifriction metal for aircraft engine bearings, together with connecting rods of famous makes fitted with this metal. There is a D.H. Gipsy engine on the stand as the latest engine to use this metal.

There is a historic collection of war-time engine parts using Number Eleven, contrasted with modern connecting rods, such as those from the Armstrong-Siddeley Jaguar, the De Havilland Gipsy, the Cirrus, and the Cirrus Hermes.

Round the walls are photos of famous types of engines using this metal, these including all the well-known British makes, and abroad the metal is used by Isotta-Fraschini in Italy, by Argus in Germany, by Hispano-Suiza, Lorraine and Salmson in France.

SEAWORTHINESS TEST OF "ROHRBACH-ROMAR."

SEAWORTHINESS !

Seaworthiness will always be one of the most difficult conditions to be met by flying-boat constructors.

For quite a couple of years the Aircraft Industry has been unable to guarantee their Customers any reasonable figures of seaworthiness for flying-boats.

The Rohrbach Metall-Flugzeugbau G.m.b.H. was the first firm, ever since the construction of flying-boats was started by the industry all over the world, to guarantee, for the three "Rohrbach-Romar" ships then under construction seaworthiness in a sea up to force 5 (Beaufort).

On December 12th and 13th, 1928, the "Rohrbach-Romar" underwent her seaworthiness trials, under supervision and to the entire satisfaction of the "Deutsche Versuchsanstalt für Luftfahrt and Deutsche Lufthansa A.G.," who satisfied themselves of the excellent manœuvrability of the ship in rough waves.

Digitized by Google

To find a British product of this kind in such widespread demand over the world is a great consolation to our national pride.

HUMFREY-SANDBERG (SALES), LTD., Transport House, Smith Square, S.W.1. Stand No. 197.

The outstanding feature of this stand is the Humfrey-Sandberg Unidirectional Clutch, a working model of which is demonstrated.

This apparatus is the modern counterpart of the old ratchet and pawl mechanism, and performs the same function without the backlash or shock associated with the older method.

The clutch is silent in operation, and is totally enclosed, and thus is unaffected by corrosive or abrasive atmospheres. It is also extremely light and compact, and at the same time has a high torque-carrying capacity.

Invented in 1924 by Mr. J. C. W. Humfrey, this gear has been extensively used as a free-wheel drive for motor-cars, as a simple friction clutch, and for many other purposes. The gear consists of a roller bearing, with the rollers set at an angle instead of lying parallel to the axis of the shaft. The rollers are held in position by a cage, which is free to rotate, without any load.

Pressure applied axially from left to right causes the rollers to rise and jam, thus locking the gear. Rotation in a reverse direction releases the rollers, which then act as an ordinary roller bearing.

The apparatus can be used as a ratchet reducing gear, with ratios varying from 10 to 1, 600 to 1, and even infinity to 1.

It suffers very little wear and tear, and what there is, is self-compensating.

As a slipping clutch for unidirectional torque, it lends itself to exceptionally delicate control. It also provides an automatic differential coupling clutch, which can be operated at any desired speed.

H. M. HOBSON LTD., Acton. Stand No. 17.

Claudel-Hobson carburetters as used on sundry aircraft engines are shown on this stand. They have been used since the early days of aviation, and little has been radically changed in the more recent designs.

The Telegage, shown on this stand, a new form of fuel contents gauge, is made in this country under licence from American patentees.

J. J. HABERSON AND SONS LTD., Rotherham. Stand No. 38.

This firm exhibits steel strip of various specifications which they have turned to producing for the aircraft trade. Samples of the strips are on the stand and are numbered so that those interested may see the specification by referring to the index which can be obtained on the stand.

IMPERIAL AIRWAYS LTD. Stand No. 43.

Imperial Airways was unfortunate in its choice of location under the arch connecting the Main and New Halls and it was also unfortunate in its choice of exhibits.

The backside of the stand was intended to illustrate a section of the cabin of an Argosy, the back wall representing one side of the cabin with seats, windows and cuspidors. According to Imperial Airways publicity the public were invited to test for themselves the "comfort" (?) of the cabin.

Through the windows was shown a moving panorama of the England—Egypt—India air route. On several occasions one glanced through the cabin, without going through the contortions of introducing one's medium length legs between the cramped seats of the mock cabin, but the illusion of actual flight was sadly lacking and the scenes behind represented successively a waterspout in mid-Channel, a view of the Blackpool amusement park and a retrospective impression of Wembley.

The cabin was nearly always dirty, the tin receptacles invariably out of place and on one day the foreground leading to the cabin was one vast pool of water. If anything was likely to choke people off air travel it was an attempt to screw themselves into these singularly uncomfortable chairs.

On the front of the stand were various maps, diagrams and charts illustrating the European air connections, the growth of the number of passengers and the amount of freight carried over these routes, etc.

One ingenious map showed the positions of the various cities in Europe indicated by a circle on an otherwise blank sheet of glass. In the margins of the map were the names of roughly 100 cities each with an individual push button. By depressing a button a line of light flashed up on the map showing the air connection between London and the city whose button was pushed. Simultaneously an illuminated sign gave the times of departure and arrival, the single and return fares, the rates for excess baggage and other useful information.

Besides this an inquiry office and booking bureau formed part of the stand and selections of postcards, photographs, jig-saw puzzles and cardboard models were on sale.

For any people who cared to linger on the stand a few of Imperial Airways' standard type of uncomfortable aircraft seats were sprinkled about.

On the whole the exhibit was so poor that Brig.-Gen. Groves would have been fully justified in using it as an exhibition of the poverty of British Civil Aviation. But happily those who know how the practical side of Imperial Airways is run will realise that it is merely another example of our salesmanship being unworthy of our workmen.

INDUSTRIAL RUBBER MANUFACTURERS, LTD., 191-2, Tottenham Court Road, London W.1. Stand No. 81.

This firm supply manufactured rubber components of all kinds to the aircraft industry, and on their stand are samples of their big range of products. Petrol-resisting rubber tubing, water joints, petrol-resisting rubber sheeting, sponge rubber in all shapes and types, rubber matting, hoses of all kinds, Pitot tubing, Turner rings, Ferrolatex wheels and mallets.

The Turner ring is a braided rubber shock-absorber used in many different ways, though the common feature to all the systems is that the ring is in tension.

GEORGE JOHNSTON LTD., 173-7, Shaftesbury Avenue, London, W.C.2. Stand No. 35.

George Johnston are one of the largest accessory and internal fitting suppliers in the motor-car trade and are now, with the coming popularity of cabin machines, turning their attention to aircraft.

Large panels around their stand show a wide selection of fittings, such as ash-holders, lamps, and so forth, and also samples of various upholstery materials.

Duratex leather cloth is one of these materials and, as tests have shown it to be impervious to the action of sea-water, it is peculiarly suitable for flying-boats.

The Indian State Railways are among those who have found this material the best for their purpose.

Various forms of window-guttering, and frames for sliding windows are shown.

A neat form of air exhauster for cabin ventilation is the Ashanco, aluminium model.

George Johnston are already supplying many aircraft firms with their goods and are making a special point of catering for their especial needs. The whole exhibit is singularly interesting and attractive.

K.L.G. SPARKING PLUGS LTD., Robinhood Engineering Works, Putney Vale, E.W.15. Stand No. 157.

An assorted array of the plugs which we are told to fit and forget are to be seen on this stand. A representative selection to suit practically every known make of engine is displayed in a variety of sizes and shapes from the elongated Gipsy type to the short and fat specimen fitted to the Napier Racing Engine.

A vast amount of experimental work is being done by this firm in the production of plugs for high-speed flying.

KELVIN, BOTTOMLEY AND BAIRD, LTD., Imperial House, 11-15, Air Street, W.1. Stand No. 154.

Kelvin, Bottomley and Baird, Ltd., are well-known scientific instrument makers, who made the first compensated compass to be fitted to an aeroplane. Their stand shows a historic range of compasses from the first compass mounted in fibre in a wooden box used by S. F. Cody in 1909, to the compasses used by John Alcock and Arthur Whitten Brown for the first Atlantic flight. The compass used by the R.34 is also on the stand.

The modern range of compasses made by the firm are shown on the stand, including the P.4, which is a quick dead-beat compass.

The company are also showing a range of instrument panels made by the Pioneer Instrument Company, and widely used in America.

A peculiarly interesting feature of the stand is the Behm Echo Altimeter, which has been recently used on the *Graf Zeppelin*. The principle of the instrument is the measurement of the interval of time that elapses between the making of a sound (by gun-fire) and the return of the echo.

A demonstration model is fitted up in the stand, and works quite satisfactorily over the very short distance available.

The main parts of the apparatus are a gun for producing the sound, a microphone for picking up the echo, and a glass scale over which a spot of light swings. On firing the gun, the spot of light moves upwards, and the echo is arranged to make the spot deviate from its straight path. The distance from the start of the spot's path to the deviation is read directly off on the scale, and gives the height. Microphones may be used to pick up the echo, and by their use a skilled observer can discover the type of territory over which the craft is passing in foggy weather, or in cases of bad visibility.

Another neat instrument on the stand is the K.B.B. Vibro-

Digitized by Google

How The Lodge Works.

meter, which provides a ready means for the detection and investigation of vibrations, especially in connection with running machinery. The instrument indicates the definite amount of vibration and its direction. The design is based on the timed vibrating reed principle, and the complete instrument weighs 2lb.

LEATHERCRAFT OF MALVERN (J. H. Stephens, Ltd.), 42, Berkeley Street, W.1. Stand No. 188.

Further examples of flying clothing are exhibited on this stand in various styles and patterns, for both sexes. "Camstex," a pure camel-hair pile, is a material shown for golfing jackets, and similar uses. Also numerous leather and suede garments for adults and children are displayed.

LODGE PLUGS LTD., Rugby. Stand No. 18.

Lodge sparking plugs are displayed in attractive glass-cases surrounded by luxurious tapestry curtains and furnitures.

A very comprehensive range of plugs is shown and every type of engine is catered for. They are widely used, and, among others, are standardised on Rolls-Royce engines.

In the newest form special care has been taken to ensure adequate cooling of the central electrode. This is arranged by having a copper sleeve on the outside of the electrode and next to the mica insulation, and also the sparking-point of the electrode is separate and is forced into it with a piece of pure copper at its upper end.

A large transparency of a sectioned plug illustrates these and other points better than a description can do.

Lodge plugs are widely used abroad on the Continent and in the Southern Hemisphere.

G. AND M. LANE AND CO., 26, Ludgate Hill, E.C.4. Stand No. 164.

Designed specially to meet the needs of the Aircraft Industry, Lane's aircraft watches are a scientific development of chronography.

The watches are non-magnetic, and are dirt and shock-proof. Made with 15 or 17-jewelled movements, they are obtainable in both pocket and wrist models, with 12 or 24-hour figuring, and in larger sizes for mounting on the dash-board.

A number of these have been supplied to Imperial Airways, and the Flying Clubs.

C. LINDLEY AND CO. LTD., 34, Englefield Road, N.1. Stand No. 133.

Here are shown a selection of A.G.S. parts, including duralumin bolts and other fittings for airships.

Stainless and Nickel-chrome steels, cables, shackles, petrol and oil-filters, streamlined wires, and swaged rods, make up the exhibit.

THE LONDON ELECTRIC FIRM, Brighton Road, South Croydon, Surrey. Stand No. 116.

Examples of aerodrome lighting equipment are exhibited by this firm, and include boundary lights, Aldis signalling lamps, money flares, and beacons. Among the latter is a 24-inch rotating beacon with a silvered glass mirror for air-way work. Two 1,000-watt lamps, with automatic changing mechanism, form the illuminant. The lantern rotates at about 6 r.p.m., and is operated by electric gear.

Contact suspension gears and winches for raising or lowering aerodrome lights are also shown.

There is also a photograph of what is claimed to be the largest searchlight in the world, which was designed and made by the firm for a Continental Power for frontier defence. This searchlight is nearly 7 feet in diameter, with a candle-power of approximately 3,500,000. This light was recently described in THE AEROPLANE.

THE LIGHT PRODUCTION CO. LTD., 60/66, Rochester Row, S.W.1. Stand No. 149.

The two outstanding features of this exhibit are the company's Cygnet piston and scraper rings, and the Aerolite Mark IV compensating piston.

The former are made of centrifugally cast iron to 4K6 specification, in the form of hollow cylinders.

The rings are hammered (by a special patent process) and then surface ground on both sides, after which they are externally ground with the joint closed. The outside is then finish-ground to a tolerance of plus or minus a half-thousandth of an inch.

The Aerolite Mk. IV Compensating Piston is an interesting development. The skirt of the piston is divided into four grooves, making two thrust faces, and two gudgeon faces. The gudgeon pin faces are machined to a greater clearance than the thrust faces, which are insulated away from the main piston body.

The heat from the combustion chamber causes a greater expansion of the gudgeon pin plane, and the thrust faces being in close contact with the water jacketed cylinder wall maintain a lower temperature than the rest of the skirt.

This produces a slight change of shape, which increases the clearance of the thrust faces, and reduces that of the gudgeon pin faces.

The final result is a constant clearance of the thrust faces of the cold piston throughout all ranges of temperature working conditions.

This piston was primarily designed for motor-car engines, but it can be utilised for aero-engines equally well.

MARCONI'S WIRELESS TELEGRAPH CO. LTD., Marconi House, Strand, W.C.2. Stand No. 29.

Every type of wireless gear suitable for use in aircraft or at aerodromes is to be found on the Marconi Stand.

Transmitting sets of from 75 watts to 500 watts for telegraph or telephony, for commercial or Service use, are exhibited.

Direction-finding equipment is shown of various types for use with a radiogoniometer or an automatic visual signal whereby the pilot is warned whether he is on his course or to port or starboard of it.

The actual set installed in Mr. Frank Courtney's Dornier Wal," which probably saved his life, is shown. And in

"Sparks."

contrast to it is the new A.D.22 light aeroplane set which is suitable for the private owner to have installed in his own machine.

An equally comprehensive range of ground equipment is to be seen and in this case no effort need be made to save weight, consequently all ground apparatus looks much more bulky.

A particularly interesting exhibit is the Beacon Transmitter, which is in effect a Radio Lighthouse. It operates at about 1,000 metres wave-length and is provided with an automatic code-sender which enables a predetermined code of Interrupted Continuous Wave Signals of any frequency between 800-1,200 cycles per second to be transmitted either at definite intervals or continuously during foggy weather.

The complete apparatus is in working order and by means of a buzzer the signal transmitter can be heard. Every essential part of the whole is duplicated, and automatic signals warn the operator, should, say, a valve burn out.

It is now widely used around our coast for directing ships and will now be used for aircraft; the aircraft itself using one of the forms of direction-finding apparatus previously mentioned to keep course on the "Beacon."

A useful extra which might pay for its keep, in, say, flying-flying-boats, or similar aircraft, or more certainly on aerodromes, is a 1 h.p. portable generating set. This dual-purpose generator has a small two-stroke motor in which Electron has been used where possible, thus greatly reducing its weight.

All generators for use on aircraft are fitted with the Marconi-Newton Constant-speed Windmill, which automatically keeps the speed of the generator constant.

The Aerial Winch is also interesting, it is very light, and the speed of "let out" is automatically kept at 2 feet per second.

Models of aircraft show the various forms of aerial equipment used.

F. J. MEE, 137a, Greenwich Road, S.E.10. Stand No. 185.

One of the brightest attractions at the exhibition, particularly among the small boys, to say nothing of the big ones, was the frequent demonstrations of model aeroplanes from this stand. The performance of some of these aircraft was remarkable, and would have caused quite a sensation at Martlesham Heath.

A large selection of models was displayed, some of them winners in sundry competitions, including the Sir Charles Wakefield International Cup. Incidentally this is an excellent form of propaganda for air-mindedness among the young.

DAVID MOSELEY AND SONS LTD., Chapel Field Works, Ardwick, Manchester. Stand No. 117.

Shock-absorbers for pilots and passengers are a feature of this exhibit. These take the form of various kinds of air-cushion seats of the "Float-on-Air" type. This is a patent pneumatic tubular system of construction with a low air pressure.

"Float-on-Air" cushions are being provided for the passengers and crew of the Blackburn Nile flying-boat. Other features include inner tubes for aeroplane wheels, petrol piping, and a pneumatic bed.

THE MONO-SPAR CO. LTD., 4, Broad Street Place, London, E.C.2. Stand No. 121.

One of the most significant exhibits to be seen at Olympia is the wing on the stand of the Mono-Spar Co. Ltd.

The test section shown represents about one-third of an existing metal-covered full cantilever wing. The test piece weighed complete 265 lbs., and the equivalent section of the wing which was reproduced weighed 610 lbs., thus showing a saving on this part of the wing alone of 345 lbs. On a machine such as the Beardmore Inflexible it is estimated that the Mono-Spar wing system, if used, would give a total saving of approximately 5,000 lbs. It will thus be seen that the Stieger Mono-Spar wing reduces the structure weight in an unmistakable manner. In fact, it is claimed that it brings the aerodynamically clean cantilever monoplane structure actually below that of the corresponding biplane structure. There are fewer main structural members, the secondary structure, i.e., ribs, etc., are supported at three points instead of two, and can, therefore, be lightened and, finally, when the structure has to carry engines or other fitments, there are always three points of concentrated load which can be employed.

The structure and method of bracing as illustrated at Olympia can be adapted to fuselage structure, and the Mono-Spar Company taking a hint from the Motor Industry have already produced designs for a standard "chassis" of 200 h.p. to which a number of different type bodies may be fitted. This chassis would be a low-wing monoplane wing of typical mono-spar construction built into a fuselage fashioned in the same way.

One of the features of the wing at Olympia is the fact that the top flange of the spar is considerably stronger than the bottom one. This is one of the places where weight-saving has been introduced. This saving is made possible by the fact that the upper flange has to take the heavier compression loads.

A criticism of the system is that it places a heavy responsibility on the wire bracing. But tests with various wires cut have shown that the spar can be made strong enough to resist loads imposed by such means. A failure of a wire only affects one bay and not the entire system.

The wing at Olympia is not the final type of construction to be used for this system, it is merely shown to exemplify the system of bracing one spar against torsion and other loads.

METAL PROPELLERS LTD. Stand No. 9.

Metal Propellers are showing as their chief exhibit the hollow steel airscrew which they manufacture under Leitner-Watts patents.

These range from small airscrews of 6 ft. 6 ins. in diameter for light aircraft engines up to those 16 ft. in diameter for Heavy Oil aircraft engines.

They are made up from steel sheet. The blades are laminated internally and welded along the leading and trailing edges. Each blade is carried on a collared sleeve at its inner end and this collar fits into a special steel hub. It is free to rotate unless locked; and this provides a means of adjusting or varying the pitch of the blades.

Various hubs are shown for all sizes of engine, but in each case the design is approximately the same.

The blades are finished either by cadmium plating or else by coating with a cellulose lacquer. Both forms are shown.

The weight of this type of airscrew has proved very satisfactory. For the small sizes the makers claim that they come out about three-quarters the weight of the solid duralumin type, and for the large sizes the weight is said to be considerably less than the duralumin and almost the same as the wooden type.

The firm also make various aircraft parts in high tensile steel strip and a specimen length of a wing spar and some interplane struts are shown.

Pressings of all kinds, such as aileron ribs, aluminium spinners, etc., are also shown as some of their products.

Large numbers of their airscrews have been supplied to the Air Ministry and amongst many other uses they were used on the Southampton flying-boats during the Far East Flight. Mr. Harold Balfour, M.P., is the business manager.

FREDK. MOUNTFORD (BIRMINGHAM) LTD., Fremo Works, Moseley Street, Birmingham. Stand No. 135.

A wide range of A.G.S. parts are on view on this stand, including Fremo taper pins, both solid and split, in stainless steel, duralumin, silver steel, and copper, and to A.G.S. 167 and 213 specification. Also a number of washers in aluminium, copper, and stainless steel, brass holding-down bolts, split cotters, pins, and turn-buckles taking stresses of from 5 to 30 cwt. are shown.

Ratchet braces, die stocks, and machine vices are also included in the exhibit.

MARABINI AVIATION, 9, Avenue de Suffren, Paris. Stand No. 127.

A great variety of aircraft materials are displayed on this stand. It includes samples of plywood, steel tension wires, aeroplane wheels and tyres, bolts, nuts, and screws, as well as a number of instruments. Apart from these, M. Marabini is ready to supply anything and everything for aviation, from the complete equipment of a whole Air Line, down to a pair of goggles for a would-be aviator.

Among the exhibits is a novel and ingenious compass known as the Vion type. This compass was used by M. Lefevre and his companions (including the stowaway) in their recent trans-North Atlantic flight. The actual model was on the stand. The compass is constructed in the form of a cylindrical bowl, hermetically sealed, and filled with a non-freezing liquid, in which floats the "rose." The reading is reflected in a prism at the back of the compass.

A striking feature of this compass is the compensator for semi-circular deviation, consisting of four pairs of thumb-screws, one for each of the cardinal points. Each of these pairs carries an equal number of small magnets, and all exactly similar. The compensator can be so adjusted in respect to the position of these magnets that any desired intermediary strength may be exerted on the compass.

Another compensation for quadrant deviations is mounted in the case, and consists of two plates, which can be rotated in reverse directions, but through the same angle, by means of an aluminium knob. A second knob locks the plates in any desired position.

Another interesting exhibit is the gyro-clinometer. A circular dial marked in degrees is mounted on a base. Above the dial is a light which shines on the centre of the dial when the aircraft is in normal flight. Any deviation from the correct course causes, by gyroscopic action, the beam to travel up or down, left or right, as the case may be. The amount of deviation can thus be read, and checked accordingly.

Yet another feature of this exhibit is a combined air-speed indicator, inclinometer, and turn indicator, which can be mounted on any dashboard.

The agency for Great Britain of this company is in the hands of Flight Lieut. L. J. Riordan, A.F.C., F.R.Met.S., of Takeley, Essex, who has recently resigned from the R.A.F. on account of ill-health.

E. B. MEYROWITZ, LTD., 1a, Old Bond Street, 199, Regent Street, W.1. Stand No. 66.

E. B. Meyrowitz, Ltd., a firm of American origin, are the patentees and manufacturers of the Meyrowitz Luxor goggle, which has been designed in co-operation with well-known pilots.

They were adopted by the Royal Air Force for pilots of the High-Speed Flying Section, and were actually used by the British competitors. They have been adopted again this year by the Schneider Team, now training at Calshot. They are also used by the pilots of the Fairey Long-Range Monoplane, which flew from Cranwell to Karachi.

Two types of Luxor goggle were shown on the stand. No. 4 employs non-shatterable lenses with Triplex glass, which may be either white or tinted. For an extra of 30s. these lenses may be ground to suit any prescription, which solves the problem of those who wear glasses and want to wear goggles as well.

No. 6 is a different type of glass, with bent lenses, and is more expensive.

These are fitted with Acetex non-shatterable glass, and can also have these safety lenses ground to any prescription, the glass being white or tinted.

The making of the lenses is a tedious business, each lense taking fourteen hours of grinding, exclusive of the time taken to grind the edges for fitting in the frames, and there are 20 per cent. of breakages. All of which makes one wonder why the goggles are not more expensive.

NEGRETTI AND ZAMBRA, 38, Holborn Viaduct, E.C.1. Stand No. 195.

This well-known firm of meteorological instrument manufacturers are here showing a number of aircraft instruments, including oil pressure gauges of the transmitting type (which eliminate loss of oil through a broken connecting pipe), oil and air temperature thermometers, and a pressure gauge for airships.

Boost gauges, indicating absolute pressure in the induction pipe of an engine, and giving a range of from —6 to +8 lbs. per sq. in., are also shown.

This instrument consists of an exhausted diaphragm mounted in an air-tight case, and working on a gear. On connecting the air-tight case to the induction pipe absolute pressure is indicated on the dial. The weight of the instrument is 1 lb. 9 ozs.

Other exhibits include barographs for survey work, and other instruments.

THE NATIONAL BENZOLE CO. LTD., Wellington House, Buckingham Gate, S.W.1. Stand No. 6.

The National Benzole Co. are showing various forms of pumps for handling their products, the chief of which is their National Benzole Mixture.

They were the pioneers in introducing Benzole mixture in this country and have adhered to their original purpose of keeping it an all-British product.

They are also marketing a lubricating oil, as are most other motor-spirit distributors. This oil is a medium-priced high-grade oil which is guaranteed to pass all tests for ordinary lubricating oils.

Benzole mixtures are widely used for aviation engines as they prevent knocking.

The National Benzole Co. have an aviation department and are making arrangements for supplies to be available at most principal aerodromes.

NATIONAL FLYING SERVICES, LTD., Grand Buildings, Trafalgar Square, W.C.2. Stand No. 75.

The stand of National Flying Services was in use chiefly as an information bureau and as a booking office. Pupils for the London centre at Hanworth and the various provincial schools could sign on for anything from an hour's trial lesson to a complete course for an A or B licence.

A number of people booked trial lessons for two guineas, and some of these people have, as the result, decided to take further lessons.

Those who booked a trial lesson were taken to Hanworth Park aerodrome which is to be the London aerodrome of the company. With one of the instructors they were then given "dual" in a Simmonds Spartan (Cirrus III) and were, if complete novices, just allowed to feel the controls, or if old pilots who were completely out of practice, were allowed to handle the controls and get back their "feel."

At present the landing area of Hanworth is small and is surrounded by tall trees. In the fall these are to be cut down but at the present season, when the sap is still rising, this is impossible.

The club-house is an old mansion standing among trees in the middle of the aerodrome and when it is complete there will be ample landing space in any direction of the wind all round.

Members of N.F.S. will be able to hire aircraft at the rate of about £1 1s. per hour. The instructional machines will be Spartans (Cirrus engines), single-seat hire machines will be A.B.C. Robins (Scorpion engines), two-seat hire machines will be Blackburn Bluebirds (Cirrus engines), and air taxis will be Desoutter three-seat cabin monoplanes (Cirrus Hermes engines).

The uniforms of the N.F.S. pilots caused considerable comment at the Show. Opinions were sharply divided as to whether uniforms are desirable, or dignified, and as to whether these particular uniforms are becoming or suitable for their job.

NORTH AND SONS LTD., Whippendell Road, Watford, Herts. Stand No. 82.

North and Sons Ltd. originally made high-grade watches, and in the early days of the automobile industry began the manufacture of speed indicators.

Within a few days of the outbreak of the war 1914-18 the work of designing a magneto was begun, and the magneto produced was so successful that the whole output was commandeered for use by the Royal Naval Air Service. In order to keep pace with the increasing demands of the Admiralty, and subsequently the Air Ministry, the works were more than once considerably enlarged.

Large sums have been spent every year on experimental and development work to ensure that the Watford magneto may be more than equal to the increasing demands of the modern aero-engine both with regard to speed and endurance. The present works are equipped with the most modern plant for the manufacture of magnetos.

These types are shown on the stand, together with examples of a light alloy impulse starter and a flexible coupling of neat design.

The Watford Magneto is of the inductor type which gives four sparks per revolution. The body is a light alloy casting incorporating six sets of steel laminæ. Four of these are energised by four bar-type permanent magnets screwed to the block, and the remaining two are connected through the stationary armature fixed on top of the alloy casting. These latter two are energised through the rotating inductor from the remaining four laminæ and their attached bar magnets.

This arrangement means that it is possible to waterproof the winding and have a minimum of moving parts. These magnetos have been rotated at 8,000 revs. per minute, resulting in the production of 32,000 sparks in the same time quite satisfactorily during some tests. The bearing for the contact breaker is renewable and made of bronze. The plate on which the breaker is rocked for advancing and retarding the spark is of high-tensile steel.

INTERNATIONAL AEROBATIC CONTEST

Captain Hubert Broad flying a Gipsy Moth fuelled with Pratts High Test Petrol won this sensational event at Heston Aerodrome on July 20.

In aerobatic work, pilots cannot afford to take chances with petrol. Reliability of fuel is of paramount importance. Hence the choice of Pratts High Test.

Digitized by Google

The Original Makers of Aircraft Tyres.

Watford magnetos of this type were fitted to the Napier Lion in the Supermarine S.5 at Venice in 1927.

The flexible coupling developed by the firm is very neat and does away with any end load. Essentially it consists of two gears, one of 18 and the other of 19 teeth, which fit a splined rubber brush contained inside a light alloy drum. This rubber bush also serves to absorb vibration.

NOBEL CHEMICAL FINISHES, LTD., Slough, Bucks. Stand No. 44.

Various panels round the stand of Nobel Chemical Finishes, Ltd., show the results to be obtained from the use of the various dopes, enamels, and paints made by the firm.

To illustrate the resistance of their acid-resisting enamels, a number of rods covered with enamels of this class, in varying colours, have been having a bath in accumulator acid since the opening of the Show. At the time of writing there were no signs of deterioration.

The firm produces both nitro-cellulose and cellulose acetate doping schemes for aircraft. They supply enamels for airscrews. They make a special grey-green enamel for cockpits. With the introduction of all-metal fuselage and wing structures, Belco and Necol enamels made by the firm are being increasingly used, an example being the Fairey Long-Range Monoplane.

The firm publish an attractive booklet called "Modern Spray Practice," which is a good handbook, giving a detailed account of the best way to produce satisfactory sprayed surfaces, and is very instructive. Copies may be had by applying to Nobel Chemical Finishes, Milbank, London, and mentioning THE AEROPLANE.

THE PALMER TYRE LTD., 100/106, Cannon Street, E.C.4. Stand No. 45.

The stand of the Palmer Tyre Ltd. shows a varied range of their well-known products, including a very large wheel with brake and tyre 2,000 × 450.

In the early days of aviation most aircraft were fitted with bicycle or small size motor-car wheels and tyres, and it was not until 1913 that the problem of aircraft wheels and tyres was tackled seriously by Palmer Tyre, Ltd. With the assistance of the Royal Aircraft Factory the research and experimental department of the Company designed and constructed an entirely new type of aeroplane wheel and tyre, together with the necessary plant for making them, and within six months the first pair of wheels were produced and submitted for official test. These wheels were so successful that a small contract was placed with the firm by the Government. In 1914, Palmer aero wheels and tyres were available in small sizes for the types of aircraft then in use. From this small beginning grew the comprehensive Palmer organisation which provided wheels for practically every aircraft produced in this country during 1914-18.

That these wheels and tyres were evolved on correct principles is demonstrated by the fact that, apart from several minor improvements that have been made from time to time, the present Palmer aero wheel and tyre is still fundamentally the same.

The Palmer brake consists of an inflatable tube which forces a number of shoes against the brake drum. On the stand is a demonstration exhibit showing the way the brak is operated. There is also a table laid out with all the com ponent parts so that one may see the care exercised i detail design.

THE PYRENE CO. LTD., 9, Grosvenor Gardens, London S.W.1. Stand No. 67

The Pyrene Company's stand shows the wide selection o equipment which has been developed to meet the fire-fight ing requirements of Aeroplanes, Airships and Aerodromes.

The latest improved model of the "Pyrene" Fire Extin guisher for aircraft use will project a powerful continuous jet of fire-fighting fluid in any required direction, and i will operate at any angle and with any side up. The specia fluid used remains effective indefinitely, it will not freeze and contains neither acid, alkali salts, nor moisture.

The "Phomene" fire extinguisher is of the foam type and is recommended as first-aid protection for hangar an petrol and oil stores fire risks. It is of two gallons capacity and generates about 16 gallons of foam. A "Phomene" fire-engine acts on the same principle as the hand extin guisher, but are of 10, 34, and even larger capacities.

A two-gallon "Conquest" soda-acid type fire extinguishe affords protection for all the more ordinary fire risks o aerodrome buildings.

Hose and general fire appliances are also shown fo dealing with large outbreaks.

PHYLAX FEUERLOSCH - AUTOMATEN - BAUGESSEL SCHAFT m.b.H., Fehrbellinerstrasse 47/48, Berlin, N.54 Germany. Stand No. 162

Portable and suspensory fire-extinguishers are here being demonstrated. Of special interest is the "Phylax" auto matic fire-extinguishers.

The apparatus consists of a metal cylinder containing th chemical fluid, from which syringe pipes are led to variou parts of the engine. A length of copper piping is als carried to the engine, and is fitted with percussion caps a the extremities. In the event of fire the percussion caps ex plode a cartridge, which releases a valve, thus causing th fluid to spray over the engine.

The apparatus can also be used as a hand extinguisher b disconnecting the fuse, and removing the cylinder from th bracket. By striking a knob the fluid is released through a nozzle.

The weight of the apparatus, without piping, is 3.050 kg.

POWERPLUS (1927) LTD., 329, High Holborn, London W.C.1. Stand No.

Powerplus (1927) Ltd. manufacture the Powerplus positiv displacement blower or supercharger for aircraft engines It consists essentially of a number of vanes driven by a roto in a casing whose centre is eccentric from that of the roto The makers claim that this blower will furnish enough ai for the requirements of the largest aero-engine in use at th present moment at a maximum pressure of approximatel two atmospheres.

The Powerplus blower compresses its air to discharge pres sure while still in the casing. It is fitted with a variabl port control, operated from the cockpit of an aeroplane

which either allows the blower to run light at ground level or to deliver whatever boost pressure is required up to the maximum output. Two types of blowers suitable for aircraft engines are made, one for large and the other for medium-sized aero-engines.

With a Powerplus Blower weighing approximately 75 lbs. complete with by-pass control it is possible to obtain sufficient output to maintain ground-level power on a 500 h.p. engine up to 16,000 ft., the blower absorbing less than 50 b.h.p. at full load. By means of the by-pass it is possible to reduce the h.p. absorbed to approximately 7 when supercharging is not required.

The overall dimensions of the larger blower are 17 in. by 12½ in., but variations may be made, as, owing to the design, great elasticity is permissible in external dimensions.

The machines are readily adaptable to be designed as part of the crankcase of an engine or may be mounted separately.

A third blower is available for use as a high-pressure scavenger-blower suitable for high-speed compression-ignition engines.

ROTHERHAM AND SONS, LTD., Coventry. Stand No. 144.

A selection of accessories for aero-engines comprises the exhibit of this firm. It includes petrol cocks, filters, unions, and numerous A.G.S. parts.

An hour-meter for recording the running time of an engine is of interest. The meter is governed by a balance and escapement, and only records time while the engine is running. The dial shows time up to 1,000 hours, and can be sealed if required.

THE RIPON STEEL CO. LTD., Ripon, Yorkshire. Stand No. 114.

"Standard" steel-framed buildings of the pitched roof type, suitable for hangars, aerodrome buildings, and lock-up garages are shown by this firm.

The stand itself is a miniature of one of these buildings, and is fitted with a "Frontoside" door, also made by the Ripon Steel Co. These sliding doors travel across one end, and along one side, in a groove, and are designed for cubicles. A number of these cubicles and doors have been erected for the use of private owners at Heston Air Park.

Other exhibits include models of the "Omega" design of buildings, which are constructed of independent iron arched sheets. One of these sheds has been constructed for the Singapore Flying Club, and another, with over 400,000 feet of floor measurement, for the 1930 Antwerp exhibition.

Also on this stand is a "Fast Grip" Parallel Fitters' vice, a special feature of which is the provision of a secondary screw-thread of half the pitch of the main screw, giving a four times greater purchase. A portable stand is provided for wheeling the stand about the workshop.

Illustrations and photographs of various steel buildings complete this exhibit.

Boosters.

THE REYNOLDS TUBE CO. LTD., Hay Hall Works, Tyseley, Birmingham. Stand No. 163.

At the end of the Reynolds stand—or, rather, office-building—is a window through which a vista of their works with the staff hard at work may be obtained. The perspective of the enlargement is nearly symmetrical, which enables the photograph to be mounted on a curve. This curve assists the illusion considerably. The effect is practically stereoscopic.

A complete range of tubes is shown, including tapered axles, which are 9 S.W.G. at the bend and only 17 S.W.G. thick at the top end.

The Reynolds Tube Company are very keen that aircraft people, and especially drawing offices, should understand the technique of tube manufacture and production, because only by this means can the two industries work together for good. As a result of this policy much talking has been done on this stand long after Olympia has gone to bed for the night.

The tube-makers and the tube-users are really getting down to brass tacks—or, in this case, chrome-molybdenum.

At the moment the production of tube for the aircraft industry is no light job—there are four stages to be gone through and repeated three times before a tube is ready. Annealing, pickling, washing and rolling all take time, with the result that it takes probably 14 days to get a batch of tube put through.

No doubt standardisation of the diameters—that is, to standardise the diameters employed—and to standardise materials, would considerably facilitate the work of the tube-manufacturer.

LLEWELLYN RYLAND LTD., Balsall Heath Works, Birmingham. Stand No. 69.

The stand of Llewellyn Ryland shows a number of plates finished with "Rylard" varnishes and enamels, but the exhibits shown by this firm were really to be seen all over the Show in that nearly every aircraft manufacturer uses this product.

The development of "Rylard" was an achievement of which its producers may be justifiably proud.

It was the consummation of a long series of experiments, made with materials new to the trade, in an endeavour to produce a really satisfactory waterproof varnish.

Early in 1913 the sponsors of "Rylard" decided to place this unique product on the market. An exhaustive series of tests, carried out under many and varied climatic conditions, had confirmed the vastly superior waterproof and weather-resisting qualities of the varnish over the older types then in use.

It was upon the outbreak of the war, 1914-18, when the Air Ministry was seeking a suitable protective aircraft coating that the supremacy of "Rylard" was established. After most exacting tests had eliminated all other varnishes, "Rylard" was adopted by the Air Ministry.

The whole of the output of "Rylard" was taken by the Air Ministry, and during 1918 the production reached enormous figures.

The rapid drying qualities of the varnish enables production of aircraft to be speeded up, and the extreme hardness of the film permitted the safe handling of machines and parts in the minimum time. Its durability in all climates and its resistance to water, oil and petrol makes it outstandingly serviceable.

"Rylard" has been used on all the recent notable performances put up by British aircraft, including the Supermarine S.5, the Supermarine Southampton which flew to the Far East, the Short Singapore in which Sir Alan Cobham flew round Africa, the Fairey Long-Range Monoplane and on all D.H. Moths.

Referring to the last mentioned, Llewellyn Ryland in conjunction with the De Havilland Company have produced a very neat booklet of colour schemes. This booklet is so arranged that would-be owners of D.H. Moths can see what their machine would be like in any combination of colours by arranging pages of various colours behind a stencilled picture of a D.H. Moth,—a clever idea.

This firm have recently produced a pigmented Nitro Cellulose Lacquer which they call "Zilak." They supply it in all colours. There are some panels finished with this on the stand which have very attractive surfaces indeed.

THE RED LINE MOTOR SPIRIT CO. LTD., 16, Charles Street, Haymarket, S.W.1. Stand No. 39.

Various forms of the ubiquitous fuel pump are shown on this stand. A touch of originality is the model and pictures of suggested layouts for an aerodrome with a landing-place for seaplanes.

This make of spirit is well known for motor-cars, but their entry into the aviation field is quite recent.

Digitized by Google

AUSTIN REED LTD., 103-113, Regent Street, W.1. Stand No. 153.

This stand caters for the sartorial needs of flying men,—and women,—and a variety of garments are displayed.

A very practical two-piece flying suit is shown, made of flame-proof gabardine. The trousers are fitted with knee pockets and lightning fasteners, and the jacket also serves as a useful motoring coat.

A one-piece suit, with lightning fasteners at ankles and front opening, is likewise shown.

There are also flying garments for "the ladies" in suede leather, as well as silk undergloves and helmet linings.

Goggles, helmets, leather coats, and flying boots complete the display.

This firm's interest in aviation is not confined to clothing, as they are also agents for an air-taxi concern.

RUBERY OWEN AND CO., Darlaston. Stand No. 5.

Rubery Owen and Co. are large manufacturers of aeroplane components, and their show-cases display a varied assortment of Bolts, Nuts, Turnbuckles, Eyebolts, Shackles, Shackle Pins, Washers, Studs, Thimbles, Fork Ends, etc.

They are shown in various materials such as High Tensile Steel, Staybrite, Duralumin and Mild Steel. All are A.G.S. parts.

Rubery Owen and Co. are among the approved firms on the Air Ministry list and as such supply large quantities of these articles to the Aircraft manufacturing firms.

All the normal steel parts can be supplied Cadmium-plated if required; a form of protection which is rapidly coming into general use. Or if preferred they may be galvanised as is done for some flying-boat work.

During the war their output of aircraft accessories and steel components reached a huge figure, and although the present-day demand does not equal that of the war, the Company employs to-day several hundred men on aircraft work alone and are at the moment increasing their plant to cope with the constantly increasing demand.

Rubery Owen components have been used on all the prominent British post-war flights, notably the England-Australia-England flight of Sir Alan Cobham, the England-Australia flight of Mr. Bert Hinkler, the England-India non-stop flight of the Fairey Long Range Monoplane, etc., etc.

Many early pilots will remember the Rubery, Owen patent Anchor Slip, which was a quick-release device primarily intended to hold an aeroplane to a peg in the ground, or a fence or other suitable anchorage, while the engine was being run up, thus eliminating chocks or any outside help, particularly when making cross-country flights. In the early days of the war it was adopted by the British Government as a temporary bomb release gear and was then the only suitable article in existence for this purpose.

J. RICHARDS AND SONS LTD., Wellesley Road, Croydon. Stand No. 146.

This exhibit comprises radiators for various types of aero engines, honeycomb-tubes, copper pipes and joints.

Induction and exhaust manifolds are likewise shown.

RANSOME AND MARLES BEARING CO. LTD., Stanley Works, Newark-on-Trent. Stand No. 40.

Ransome & Marles Bearing Co., Ltd., began the manufacture of ball-bearings in 1906 and their output since that date has been one of continual growth. They first became identified with the aircraft industry at the outbreak of the war. During the war their entire output was taken over by the Ministry of Munitions and practically every bearing manufactured by them during that period was used in aircraft. The knowledge thus gained in the manufacture of bearings suitable for aero-engines and the like has been used to the full advantage in the bearings now supplied by the company to the leading aircraft and aero-engine manufacturers all over the world.

The supreme accuracy of R. & M. Bearings is well known, but it may be of interest to note that in their products the balls in any one bearing do not vary by more than 1/50,000 in., while the concentricity of the tracks with the bore and outside diameter in no case exceeds .0001 in. The Company is making bearings for the highest speeds of any spindle used in aircraft construction, and it is daily supplying bearings which have to run at a speed of 24.000 r.p.m., and this speed is occasionally exceeded up to a maximum of 30.000 r.p.m.

Two large show-cases exhibit the wide and varied range of bearing that are suitable for this purpose and all types are to be seen.

One particularly interesting bearing is the high-speed type. In this the cage is made of duralumin and thus decreases the loads due to centrifugal action to such an extent that speeds in excess of 24,000 r.p.m. and up to 30,000 r.p.m. may be safely used.

Another new type is the duplex double-purpose type. Here the outer race has two distinct tracks, and the inner race, which is in halves, also has two tracks. Under load the balls track on one of the inner races and on the track on the opposite side of the bearing in the outer race. The bearing is intended to resist thrust loads in either direction, and a reversal of load causes the balls to track on the opposite sides to those described above. This bearing, the makers claim, solves the problems of high-speed shafts where heavy thrust loads are encountered.

A bearing of this type, some 4 feet in diameter, carries the revolving top of the airships' masts which are now being erected for the operation of the new airships, R.100 and R.101.

Various applications of the bearings are shown in aircraft engines and parts of controls, etc., and serve to show the confidence that manufacturers have in their products.

EDWARD STANFORD LTD., 29 and 30, Charling Cross, S.W.1. Stand No. 198.

After over 70 years' experience of map production this firm has now turned its attention to aeronautics, and at Olympia a variety of maps for the air traveller are displayed.

A special feature of these maps is their lightness and durability, and the prices are not excessive.

The maps are mounted on thin aluminium sheets each 10 inches square, eyeletted round the four edges, and clipped together, with a cover, by split rings, the whole resembling a loose-leaf book.

The sheets are rendered impervious to oil, petrol, and water by being treated with a preparation known as "Lutra." With this preparation notes on routes, distances, and courses of any flight can be written on the map, and can easily be wiped off with the finger, or a damp rag, without damage to the map.

A special sliding aluminium carrier has been designed for light aeroplanes to fit into a recess over the dashboard in the cockpit. When flying on a marked route, and one side of the sheet is finished, it can be removed and reversed end-for-end. When both sides are completed, the sheet can be removed and stored out of the way in a pocket in the side of the cockpit, and the next is then exposed for use.

Among the air maps already produced are quarter-inch Ordnance Survey maps of Britain, a ten-mile aviation map of Great Britain, and a number of Continental maps, with routes, distances, and courses, and positions of aerodromes inserted on loose-leaf sheets.

Other exhibits include wall maps treated with the "Lutra" process.

J. A. STEVENS LTD., Upper Rathbone Place, W.1. Stand No. 73.

J. A. Stevens Ltd. represent the famous firm of Robert Bosch A.G. in this country and their stand shows all the latest Bosch products.

The Bosch magnetos are of the inductor type and give four sparks per revolution. This allows the magneto to be run at a lower speed than would otherwise be the case. This, in conjunction with the robustness of the moving part (the inductor) and the fact that the contact breaker, the condenser and armature are all stationary, makes the magneto especially suitable for aero-engines.

One of the most interesting exhibits on this Stand is the new Bosch Magneto with electrical control advance and retard ignition, suitable for aircraft engines. In this magneto the change-over from fully advanced to the fully retarded position and *vice versa* is made electrically without the aid of control gear or centrifugal governors. There are two contact breakers at different angles on each side of the cam on the steel shaft through the rotor. One of the contact breakers is set at the advanced and the other at the retarded position, and as long as the engine is running both contact breakers are operated mechanically by the cam. One or other may be brought into operation by means of a simple change-over switch, which opens or closes the contact-breaker circuit operating the retarded ignition.

By this means a much lighter magneto is obtained, the additional contact-breaker and switch being lighter than the park of an automatic device, and there are no control rods and no movable parts on the rotor. The possibility of damage to the change-over switch or cables is very remote, but should damage occur, the magneto continues to work on advanced ignition.

A sign of the times is to be noticed on the stand in that the firm, though magneto manufacturers, are making oil-injector pumps and nozzles for Compression-Ignition (or any form of pressure injection) engines. After all, if we all use compression-ignition what would the poor magneto manufacturer do then?

There is a fuel pump on the stand working 6 nozzles of varying types. To reduce the smell of the crude oil a certain amount of Eau de Cologne had been introduced to the fuel with the result that the spray smelt almost attractive!

There is a sectional model three times full size on the

stand which illustrates very clearly the action of the pump and the ingenious method employed to vary the quantity of fuel delivered per stroke without varying the volume or stroke of the pump.

S. SMITH AND SONS (M.A.) LTD., Cricklewood Works London, N.W.2. Stand No. 143.

This company has specialised in the production of aircraft instruments and accessories since its inception in 1914, but even before this the parent company, S. Smith and Son, Ltd., handled aircraft instruments in a small way. With their pre-war experience the company was thus able to co-operate with the British and Allied Governments in producing large numbers of accurate and trustworthy instruments.

Since the War the company may claim to be almost the only instrument firm that has maintained a separate Aircraft Section. In the limited space available it is impossible to enumerate all the noteworthy performances of aircraft and airships that have been successfully accomplished with the aid of Smith instruments, or to give a list of countries to which Smith instruments have been supplied in large quantities.

Similarly it would absorb considerable space to give here a complete list of the company's products. Suffice to say that they manufacture practically every type of flying instrument and a large number of accessories, that practically every British, and many foreign, flights of note from the first crossing of the Atlantic to the present day have been done with the aid of Smith instruments, and that the company has supplied some of its products to practically every country in the world.

During the past few years the Aircraft Department of the company has developed very considerably, and their progressive policy and enterprise is amply shown by their present output of practically every type of aircraft instrument, a complete range of which is shown on their stand.

Amongst this range a number of interesting components are outstanding either by reason of their novelty or practical value.

The first of these is the Armour wheel entrenching tool. This is a device for digging a small pit for each wheel of the machine to enable it to stand up to heavy winds when left out all night. The next is the Armour wind-direction indicator. This should be very useful in cross-country flying or in the event of a forced landing. The gadget consists of a number of glass tubes in a small container operated by a lever placed close to the pilot. On pressing the lever a tube is released and falls to earth, where it shatters. The contents, which are harmless and quite non-incendiary, produce a smoke-effect which blows away clinging close to the ground, thus indicating immediately the down wind direction.

Top, the Schneider Instruments reading up to 400 m.p.h. and 4,400 r.p.m. Below, dashboards for the Bluebird and the Robin.

There is also a demonstration of a Carter oil cleaner and cooler as mentioned in Mr. Foord's lecture on lubrication.

There is an extremely neat modification of the D.H. Moth air-speed indicator. This device is really an aerial taximeter. As soon as the indicator reaches flying speed a clock starts work and continues to do so until the indicator ceases to work, when the clock stops. As a result one has an automatic record of flying time.

There is also an exhibition model of a Vortex silencer, now being tried out to silence engines on light aeroplanes.

Round the walls of the stand are a number of nicely-finished instrument panels for various makes of commercial aircraft, incorporating a complete range of instruments.

As a contrast there are the types of air-speed indicator and rev-counter as used for the Schneider Trophy Contest,—going up to 400 m.p.h. and 4,000 r.p.m. respectively!

STERLING METALS LTD., Northey Road, Foleshill, Coventry. Stand No. 142.

Sterling Metals Ltd. was formed twenty-five years ago to specialise in the production of castings for the automobile industry. This company rapidly developed and expanded by reason of its close association with, and intimate knowledge of, the ever-increasing demand for higher grade alloys and close limits.

This particularly applied to the aluminium alloy productions, and the outbreak of war in 1914 found their plant and staff peculiarly equipped and qualified to meet the urgent needs of the Aircraft industry. This branch of their industry was, of necessity, developed to such an extent that to-day Sterling Metals Ltd. is in the forefront of casting production as applied to the Aircraft Industry.

They have devoted their attention to the question of weight reduction. Magnesium has so far offered the greater possibilities in this direction with its advantage of being approximately 40 per cent. lighter than the standard aluminium alloys. As the result of its enterprise and foresight the company has, after several years of experiment and research, a large department engaged in the commercial production of magnesium alloy castings under the trade name of "Electron."

The exhibits of Sterling Metals Ltd. represent their various activities in the production of light alloy castings. The largest part of these exhibits are devoted to "Electron" products. This material is the lightest commercial metal. It has a specific gravity of 1.82 and can be supplied in the form of castings, extensions, forgings and sheet.

There is a nose cowling on the stand made from electron sheet. The material casts well and the introduction of manganese to the magnesium alloys has done much to minimise the troubles experienced from corrosion.

The material has been used on the Continent for some time and is much favoured by Continental manufacturers, as could be seen at the Berlin Aero Show last year.

The material is now being taken up by the Aviation Industry in this country and this company is hard at work meeting their requirements.

A very interesting book, "Magnesium Alloys," is produced by the company for 7s. 6d. It is full of valuable information. It is also the only text-book available in this country at the moment.

SHELL-MEX LTD., Shell Corner, Kingsway, W.C.2. Stand No. 1

"A modern stand, intended to symbolise the modernity of the subject of the Exhibition," is the way Shell describe their stand. It does not follow the modern school of so called art so far as to make one think of Underground Railways! but it remains a distinctly attractive symphony in silver-grey and red.

The business side is kept in mind by a large window exposing an office desk with its usual litter of papers, and the aeronautical side by models of some of the more notable aircraft which have used Shell.

A daylight cinematograph display of aviation interest serves to keep the attracted crowd interested.

The duralumin tube stools are, one supposes, meant to symbolise aircraft construction, but are their raw-hide seats symbolisation of the Mexican side of the firm? No doubt the glass table and white carnations illustrate the clarity and purity of their product.

Altogether the stand is very pleasing.

SIMMS MOTOR UNITS, LTD., Percy Buildings, Greek Street, London, W. Stand No. 1

This firm showed a range of magnetic petrol gauges for aircraft tanks of various sizes, from the light aeroplane type to those suitable for multi-engined machines. These gauges are also being supplied for H.M. Airship R.100.

They are constructed almost entirely of duralumin, and

What Makes the Air-Lines Go.

their operation is extremely simple. Behind the dial, to which is fitted a floating needle, is a permanent magnet to which is attached a brass rod of varying length according to the capacity of the tank.

At the other end of this rod is a wood float, which rises and falls with the amount of petrol in the tank, thus rotating the magnet, which in turn moves the pointer on the dial.

Another type of gauge is also shown in which a long duralumin tube is connected to the gauge head. Along the whole length of this tube is a spiral slot making one complete turn.

A brass rod runs through the tube, and is connected to a magnet at the top. A float travels along the spiral slot, either up or down according to the level of the petrol in the tank, and rotates the magnet.

This firm are also showing magnetos for four-cylinder engines, including a new type, cast in aluminium, with impulse starter couplings, the whole weighing only 11lb. The couplings are wired with oil-proof high-tension cables. The distributor is mounted on roller bearings. Special high-speed contact-breakers with non-seizing bushes are fitted, and the rocker arm is made of duralumin.

Another interesting exhibit is the "Vortex" air cleaner. This is also cast in duralumin, and consists of a hollow semi-circular tube open at both ends. One end is attached, by means of a tubular adapter, to the carburetter intake. Underneath is a glass container, which is filled one-third full with engine oil. Dust and dirt is then sucked in through the cleaner and into the glass container.

The cleaner can be adjusted to suit any type of engine.

Other exhibits on this stand include a range of Vernier couplings in duralumin and stainless steel.

SOCIETA ANONIMA RILEVAMENTI AEROFOTOGRAMMETRICI, 11, Via Francesco Negri, Rome, Italy.
Stand No. 178.

Among the exhibits included on this stand is the famous Salvator parachute, two of Sq. Ldr. Waxy's brothers being employed to demonstrate its efficiency. A display of air survey apparatus is another feature of this stand.

A mosaic of Lundy Island, together with maps and charts made from it, is displayed on the wall.

A number of Nistri air cameras of various types is included in the exhibit. These are of all-metal construction and are fitted with automatic releases.

Other exhibits include gun-cameras, also of Nistri design, and an auto-stabilising periscopic bomb-sight.

On the Italian Air Ministry stand, No. 62, is shown a Nistri plotting machine for air survey work.

SUPERFLEXIT LTD., 110, Cannon Street, E.C.4.
Stand No. 183.

Flexible tubing for every purpose has been the speciality of this firm for a number of years, and its products are widely used in the aircraft industry, both here and abroad. At the Paris Aero Show last year Superflexit Ltd. were awarded first prize.

At their stand at Olympia a fuselage, with a very realistic dummy engine, was used to demonstrate the uses of flexible tubing on aircraft.

One was informed that the "engine" created a certain amount of interest among the foreign visitors, who were greatly intrigued by the carved wood cylinders!

A variety of tubing was shown, ranging from 3-16 of an inch to twelve inches in diameter. The latter is special tubing for oil distribution.

The core of Superflexit tubing is made of cellulose, which covers a spiral coil of wire. It is exceedingly flexible and very light.

Included in the exhibit is a special type of union for such piping, consisting of a tapered brass threaded tube. A brass collar is fitted on one end of the tubing. Into this is threaded the tapered tube, which has been previously treated with hermetic glue. The whole is then placed in a vice and screwed tightly home, leaving about an inch of threaded brass tube for screwing into another length of tubing. The process is very simple, and can be performed by unskilled labour.

Another interesting exhibit is a patent bullet- fire- and crash-proof petrol-tank. Although this tank is being used by the French and United States Governments, no details are available, as it is now being tested by the Air Ministry.

All that one is able to say is that it appears to be covered with some sort of padded rubber, encased in a fine-mesh wire netting.

SOZOL (1924) LTD., 20, Copthall Avenue, E.C.2.
Stand No. 128

This stand is showing patent Sozol preparations for the preservation and lubrication of metal, as well as paints for structural metal work. Safety razor blades treated with Sozol rust-preventatives are also shown, together with special blended Copto lubricating oils, claimed to give the greatest lubrication with the lowest consumption.

THE SKEFKO BALL BEARING CO. LTD., Leagrave Road Luton, Beds. **Stand No. 159**

Here are shown examples of the firm's ball and roller bearings used in the various branches of aircraft construction.

Among the exhibits is an airscrew thrust bearing for the Bristol Jupiter engine, allowing of a reduction in the length of the propeller shaft and nose piece, with a consequent saving in weight. The bearing is of the self-aligning spherical roller type.

A Fairey control column fitted with Skefko bearings is also shown.

An interesting collection of photographs and drawings of aero engines using the company's bearings are displayed and include the Pratt and Whitney Wasp, Gipsy, Walter and Lorraine engines.

SPECIALLOID LTD., Friern Park, N. Finchley, London N.12. **Stand No.**

In 1914 a light-weight cool running piston for aero engines became imperative, and engineers turned their attention to its production. It was recognised that light weight alone would not constitute a satisfactory piston. Heat dissipation, distribution of weight and piston clearance were all problems which presented themselves in an exaggerated form in the design of an aluminium piston as compared with one of cast iron.

The question has been adequately solved by Specialloid Ltd., who now supply large quantities of their special pistons to British aero-engine manufacturers.

On this stand they show pistons for all types of engines both in aluminium alloy and in their own special alloy, some of which are sectioned, thus showing clearly the method of finning to dissipate the heat adequately.

They also show a form of cylinder gauge which should prove useful for grinding or reboring cylinders.

AIR PARKS.
FLYING CLUBS.
AIR TAXIS.
INSTRUCTION.

AIRCRAFT SALE AND HIRE.
TRANSPORT.
INSURANCE.
OVERHAULS.

An exhilarating half-hour in the air.

LEARNING to fly becomes a matter of simplicity under the expert guidance of the N.F.S. instructors. It is surprising how quickly the average individual is able to acquire the flying sense..... providing that the principles of the art of flying are made readily comprehensible.

A trial flight with the N.F.S. is available to everyone; not a mere joy-ride, but an instructive trip during which you share with your instructor the control of the machine. Taxying, climbing, gliding, landing.....in all these evolutions you "feel" the response of the machine to your slightest touch It is an experience you will wish to repeat often. The charge of two guineas includes free transport by car both ways between Trafalgar Square and the London Air Park at Hanworth, where the trial flights are made.

The Club members of National Flying Services join not one club but actually a group of clubs, of which the Country Club at Hanworth (30 mins. from the West End) is the first of the chain. The organisation, when completed, will embrace 71 flying stations.

A limited number of members are now being admitted to the Hanworth Club at the following rates: Flying members, 5 gns. entrance fee, and 5gns. annual subscription; Non-Flying members, 3gns. in each case For this year, two-thirds of the annual subscription is being rebated. It is estimated that for the average member the cost of learning to fly will be under £25. And after learning, flying charges scale down to £1.1.0 per hour.

Write for our booklet giving full details of the services offered by National Flying Services to those who wish to fly.

SILVERTOWN LUBRICANTS LTD., 11, Norway House, Cockspur Street, S.W.1. Stand No. 175.

Samples of "Silvertown" aero-engine oil to Air Ministry specification are shown on this stand, together with a range of "Speedoline" lubricating oils in various grades. The different stages in the production and refining process of "Silvertown" P.4 mineral lubricating oil are effectively shown.

The percentage of Conradson coke in the various stages is also shown ranging from 2 per cent. in steam-cylinder oil to .75 per cent. in "Speedoline," and .27 per cent. in "Silvertown" P.4.

The open flash-point of P.4 is given as 440°F., and viscosity at 100°, 2.45 poises, and .19 poises at 200°.

An interesting point in this exhibit is the seeming superiority of mineral over vegetable oil. The former is being increasingly used for aero-engine lubrication.

Aero-engine pistons showing the effect of Silvertown P.4 after 100 hours' run are also exhibited.

THE STEEL NUT AND JOSEPH HAMPTON, LTD., Woden Works, Wednesbury. Stand No. 80.

The stand of this firm is filled with glass cabinets containing representative samples of their products, which are nuts and bolts, to all aircraft specifications, special parts made to customers' requirements, bright steel bars, and tools such as vices and clamps. The firm has been supplying these materials to the aircraft industry for some considerable time.

SIEBE, GORMAN AND CO., LTD., 187, Westminster Bridge Road, S.E.1. Stand No. 48.

The firm of Siebe, Gorman & Co., Ltd., make diving equipment, and as a result of their experience with oxygen apparatus during the War (1914-18), they were requested to produce oxygen apparatus for high-altitude flying. They still do so. And so do several other firms.

SCINTILLA LTD., 14, Clerkenwell Close, London, E.C.1. Stand No. 46.

A big range of magnetos are shown on the Scintilla stand.

The Scintilla Magneto was first manufactured in 1919 at Soleure, Switzerland, after it had gone through an experimental stage of a number of years.

The Scintilla Magneto has, on its merits, become known all over the world, and it is now being used extensively as standard on some of the world's best cars, commercial vehicles and foremost aircraft engines. For a number of years the American Army and Navy Air Services have been using the Scintilla Magneto as standard. Furthermore, practically all important aircraft manufacturers in America, France, Czecho-Slovakia, etc., are using this magneto, which has proved its unfailing reliability in the Trans-Atlantic, Trans-Pacific and Trans-Continental flights of Lindbergh, Chamberlin, Byrd, Costes and Le Brix, Wilkins, Smith and Ulm, Jimenez and Iglesias, Kohl and FitzMaurice, and Miss Earhart, Assolant and Lefevre. The two recent refuelling records of the *Question Mark* and the *Fort Worth* were also successfully completed with the aid of Scintilla Magnetos.

An interesting exhibit is an 18-cylinder magneto sectionalised and still working. This has a four pole rotating magnet. There is also an exhibit showing the arrangement of a booster, or starting magneto, in conjunction with an existing ignition system. One can operate the booster and see the spark at any specific plug by rotating the distributor.

A neat feature of the Scintilla magneto is the variable coupling, which is flexible, does not transmit vibration, has no end load, and can be varied without uncoupling. The device consists of a dog type clutch, the teeth of which do not engage but are bedded in a rubber block. One set of teeth are keyed to the magneto spindle and the other contains a special sleeve. This sleeve is keyed to the driving shaft and is locked by two bolts to its own half of the clutch. These two bolts are also used as worms operating a thread cut in the sleeve, and by slackening them off and turning the bolts the sleeve may be set to any desired position without uncoupling any part.

TITANINE-EMAILLITE, LTD., 175, Piccadilly, W.1. Stand No. 49.

Titanine-Emaillite, Ltd., who as the British Aeroplane Varnish Co. supplied enormous quantities of dope to the Allied Flying Services, have arranged their stand to illustrate the world-wide use of their products and the application of it to present-day machines. Round the stand are a large number of testimonials from clients of the firm, foreign and British. There are also a large number of panels on the walls doped with the various colours employed on the exhibits at Olympia using Titanine schemes.

Mounted on a number of dummy wings, covered with one of the firm's doping schemes, is a small glass tank full of water. Inside this is a fabric-covered panel doped with Titanine which has been immersed since the opening of the Show. At the time of writing the fabric has been under water for eight days, and was still as tight as a drum. Titanine schemes were used on the Gloster Racers built for the 1927 Schneider Trophy competition and stood up extremely well to the arduous conditions of the race and of the training flights for which they have since been used.

One of the deteriorating influences that must be kept away from fabric are the usually beneficent ultra-violet rays, and to accomplish this the surfaces are first covered with a red dope. Over this is put a dope coloured with aluminium. The aluminium used for this purpose is produced by stamping, with the result that the aluminium is produced in the form of innumerable small plates, or laminæ. When spread over the surface these plates form a reflecting medium that keeps out heat. So much so that a test with internal and external thermometers will show a very considerable temperature drop between the inside and outside of the wing.

Titanine was used on Sir Alan Cobham's London-Capetown, London-Rangoon, and London-Australia-London flights, and in every case very successfully withstood the extremes of temperature and weather through which it passed.

Titanine was used by the Marchese de Pinedo on his Rome-Tokio-Rome flight, by Commandante Franco for his flight across the South Atlantic in a Dornier Wal, by Commander Byrd in his flight over the North Pole, by Charles Lindbergh when he crossed the Atlantic, by Mr. C. Chamberlin when he flew from New York to Germany. Mr. Bert Hinkler used it when he flew to Australia in an Avian in the record time of sixteen days. Lieut. Bentley, who has made quite a habit of flying to Capetown and back to London, also used this dope on these flights.

After these accomplishments it is not surprising to find that Titanine-Emaillite have factories at New Jersey, Milan and Bremen, besides their English factory at Hendon; nor is it surprising to find that big airlines like Imperial Airways and K.L.M. also use Titanine.

TECALEMIT LTD., 117, Scrubbs Lane, Willesden, London, N.W.10. Stand No. 76.

The Tecalemit grease gun system, which incorporates grease nipples on all points requiring lubrication, through which oil or grease are forced by a portable grease gun, is well known. The Aircraft Industry was one of the first to realise the advantages of the Tecalemit grease-gun system of lubrication as applied to landing-gear, controls, etc., and the advantage of this system was demonstrated many years ago, particularly in connection with tail plane mechanism of seaplanes, where the mechanism is frequently in contact with sea-water.

For the past two or three years the Tecalemit system has been successfully employed for the lubrication of rocker arms on the overhead camshafts of aero-engines.

Tecalemit equipment is standard on all service aircraft in this country, and the Tecalemit Lubricant has been approved by the Air Ministry for use on these aircraft.

Tecalemit have organised their exhibit with a view to showing the application of the system to aircraft. A Cirrus engine is shown with the Tecalemit system for greasing the rocker gear. There is also a number of parts from Fairey aircraft showing the way the system is used.

The next application to the system is a greaser for Bowden cables, which in the ordinary way are a bit unhandy to grease. The new device is a brass barrel fitted with a greaser nipple. The inner wire passes through the barrel and the outer casing is severed and then introduced at either end of the barrel, which has screw glands. On tightening the latter a lead coil is forced round the Bowden casing and a perfectly grease-tight joint results.

The group system of Tecalemit greasing is becoming fashionable. And the greaser nipples for a variety of parts are located on one panel with pipes running to the moving parts; a good example of this is to be seen on the Bristol machines.

This firm also markets a new electric rev. counter, which works on a pressure of 6 or 12 volts. The special feature is the absence of the usual long rotating flexible shaft.

ERNEST TURNER, Chiltern Works, 55-73, Totteridge Ave., High Wycombe. Stand No. 182.

Electrical measuring instruments are shown here, and include single and multi-range microammeters, milliammeters, millivoltmeters, for aircraft and wireless work.

THE TRIPLEX SAFETY GLASS CO. LTD. Stand No. 24.

Triplex Safety Glass is almost too well known to need any description, but, as its use in aircraft is now growing so rapidly owing to the use of cabin-machines, the makers have taken the wise step of taking a stand at the Show.

Various forms of windscreens are shown in a shattered state, illustrating the non-splinterable qualities of this glass.

Flying goggles made with Triplex lenses are also shown.

The Air Ministry specifiy Triplex for many Service aircraft, and in the airship R.101 it is used exclusively.

THOMPSON BROS. (BILSTON), LTD., Aldwych House, Aldwych, W.C.2. Stand No. 77.

Thompson Brothers began manufacturing exhaust manifolds for Bristol Jupiter engines in 1922. They are now turning out the latest type at the rate of 15 per week. There are various specimens of this type of work on their stand,

New Stanford Mounting Simplifies Map Reading.

The convenient method by which Stanford Air Route maps are mounted make them of special use in the light plane.

The maps are supplied on cards ten inches square and eyeletted around the four edges. Thus the cards may be joined together with hinged rings either North, South, East or West, or used separately as desired.

Stanford Flying Maps are treated with the 'Lutra" process, which not only waterproofs and renders the map more durable, but allows the surface to be written on and wiped clean an indefinite number of times.

The Sliding Map Carrier for Light Planes.

This is designed to fit into the recess over the instrument facia board in the cockpit. The maps are carried on hooks fixed to a sliding carrier so arranged that when it is necessary to refer to them they may be pulled out of the recess quite easily and pushed back out of the way when not actually required. They are always handy but not in the way.

together with manifolds for in-line engines. The precision of the work is amazing when one realises the thin gauges employed and the complication of the whole component.

The spherical seatings to the joints at the cylinders are very neat. The company have been experimenting with various stainless steels for this job.

Thompson Brothers have a big equipment of presses and similar machinery for the manipulation of light-gauge steels, and are prepared to do any class of aircraft work in this category to manufacturers' specifications.

TENSOMETER HUGGENBERGER, Zurich 3, Switzerland. Stand No. 51.

Dr. Huggenberger has a stand entirely devoted to the exhibition of his "Tensometer," which is a neat instrument designed to give exact readings of the elongation or deformation of test specimens under load, either in compression or tension.

The instrument consists of two points or knife-edges, depending on the type of material to be tested, which are a known distance apart. These points are pressed into the test specimen, and when the load is applied, the distance between these points increases as the specimen stretches. The amount of travel is registered by a needle passing over a scale. The movement is very much magnified, in one type of instrument, 1,500 times.

A feature of the stand is the large number of different clamps used to attach the instrument to any type of material, the means which have to be employed for this purpose obviously varying with the class of material.

For the English market the instruments are made to measure the elongation over 1in. or ½in., but by adding extension bars the distance may be increased to 40in. To get the elongation it is only necessary to divide the scale reading which is marked off in decimals of an inch by the magnification.

Three types of instrument are marketed, types A, B, and C, with magnifications of 1,000, 1,500, and 300 respectively. The low magnification being useful for soft materials, like wood.

The instrument is not large, and is supplied in a neat case, and clamps may be obtained to fasten the instrument for tests on any kind of material from wood or concrete to a thin gauge-steel sheet.

VACUUM OIL COMPANY, LTD., Caxton House, Westminster, S.W.1. Stand No. 72.

One of the features of the Vacuum Oil Company's stand is a portable truck for aerodrome use. The truck has two pumps, each of which delivers from a standard 10-gallon drum. This arrangement ensures easy replacements and security from contamination

Now that mineral oil has been approved by the British Air Ministry for radial engines, the Vacuum organisation ensures satisfactory service for any pilot on any type of machine. The great feature of Mobiloil is the fact that there is a recommended grade for every engine, and this recommended oil can be obtained all over the world, which is a point of appeal to the private owner who suddenly wishes to fly half across the world for a holiday.

One of the first aviation pioneers to use Mobiloil was S. F. Cody. The round-the-world flight of the American Army was done on Mobiloil; Lindbergh and Amelia Earhart both flew the Atlantic using the same lubricant.

HENRY WILD SURVEYING INSTRUMENTS SUPPLY CO. LTD., Heerbrugg, Switzerland. Stand No. 200.

A remarkably ingenious plotting machine for air survey work is a noteworthy feature of this exhibit. The method employed is simple, and absolute accuracy is claimed.

It is operated on a stereoscopic principle. Two plates from the air camera are put in the machine. The operator views these plates through a stereoscope, on the lens of which is a pointer. On either side of the operator are two handles, which by turning, and following the ground with the pointer, transcribe the contours on a glass plate by means of a steel point working on a differential gear.

The resultant map is then transferred to a zinc plate, from which the finished maps are lithographed.

The machine is made throughout of tempered steel.

An air survey camera is also shown, taking vertical or oblique photographs. Ten exposures can be made.

C. C. WAKEFIELD AND CO., LTD., Wakefield House, Cheapside, E.C.2. Stand No. 71.

The Castrol stand is decorated with a sign of changing colours, which are obtained from Castrol oil and coloured water being pumped through glass tubes. At each side of this are two globes of the world being turned by a stream of lubricant falling over them The walls are covered with a fine series of photographs illustrating the history of aviation from the year 1910—for the history of Castrol is the history of Aviation.

This firm have recently produced a quick service of trolley tails and pumps for use on aerodromes.

Castrol oils have so long been used for aviation and are so much a feature of aeronautical activity that they have become part and parcel of the atmosphere of flying. In the same way the munificence of Sir Charles Wakefield so permeates aviation that one finds it hard to imagine what would have happened without him. How many big flights which demonstrated the superiority of British aircraft products would have been possible without his aid?

WELLWORTHY LTD., Lymington. Stand No. 126.

Wellworthy piston rings manufactured under Gray and Howlett Patent No. 151898/20 are shown here, together with scraper and oil-control rings.

A convincing light test is demonstrated on this stand. The piston ring is placed on a frame, behind which is a light shining through a small aperture. The ring is slowly turned to show that it is absolutely true, and that no light shows.

A hair inserted between the ring and frame exposes the light.

Other exhibits on this stand are piston-ring castings in various forms of machining, and petrol priming pumps for aero engines.

For Troubled Waters—or Air.

Digitized by Google

WILLIAMSON MANUFACTURING COMPANY, LTD., Willesden Green, N.W.10. Stand No. 186.

The makers of the famous "Eagle" aircraft camera have now produced an exceedingly interesting camera for the owner-pilot. It is called the "Pistol" aircraft camera, and takes its name from the pistol grip by which the apparatus is held.

This camera weighs 3lb. 5oz., and can be held quite easily with one hand. The exposures are made by pressing a trigger.

The size of the picture taken is 3¼in. by 2¼in., a familiar size to amateur photographers. The cost of films and plates is therefore low. One also has the advantage of being able

The Williamson "Pistol" Aircraft Camera.

to use any make of film-pack or plate, with either orthocromatic or pancromatic emulsion.

The body of the camera, with the grip, is constructed throughout of aluminium. The trigger is of stainless steel, treated with a hard, durable kryslac enamel.

A Ross Xpress lens of 5in. focus with an aperture of F/4.5 is supplied, and the shutter, of sector type, has time, bulb, and instantaneous speeds up to 1-100th of a second.

The back of the camera is fitted with runners to take either plate-holders, film pack adapter, or a focussing screen. The camera will not take roll films.

The price of the complete equipment, that is, camera with Ross F/4.5 lens, one book-form D.D. slide, film pack adapter, focussing screen, and leather carrying case, is £20 10s.

This camera should enjoy wide popularity with private owners, and several orders have already been placed.

This firm show also a model of their "Eagle" aircraft camera, R.A.F. Service Type F.8, which is now extensively used by British air survey companies and foreign Governments.

Another interesting feature of this exhibit is the new roll-film developing apparatus. This has been designed to supersede the old method, which necessitated the use of large and unwieldy tanks. The outfit consists of a spool winder, developing tank, and fixing tank, which fit one within the other for transport purposes, a soaking and washing tank, and a storage case.

The developing and fixing tanks are made of nickel, and the others of sheet brass, nickel plated, with beaded edges and rolled joints. The spool centres are made of hard wood impregnated with cellulose lacquer. The complete outfit, packed in the storage case, weighs 44 lb. The price is £28 10s.

Other exhibits include an all-metal contact printer, and an auto-focussing enlarger with a 500-watt half-watt lamp, or mercury vapour lamp, giving an enlargement of 1 to 3, and a reduction of 3 to 1.

ZENITH CARBURETTER CO. LTD., 40-44, Newman Street, London, W.1. Stand No. 136.

A full range of carburetters are shown by this well-known firm, including the 48 R.B. type for the De Havilland Gipsy engine. There is also a carburetter for the new Sunbeam Sikh, Mark II and III, engine.

Another interesting carburetter has been produced for the Beardmore Typhoon engine, of the floatless, or Weir type. A feature of this carburetter is the petrol-cock, which is interconnected with the throttle control.

On the same stand is shown the new Zenith petrol-filter, which has been specially constructed for aero-engines.

The filter, which can be adapted to suit any type of engine, consists of three parts, the frame, the filter unit, and a detachable glass bowl, held by a metal stirrup. The filter-unit consists of a series of non-corrosive brass rings with a number of small ridges on one side. The rings are clamped tightly together, and there is only a few thousandths of an inch clearance between them.

The fuel is fed through the rings upwards, and all foreign matter sinks into the glass bowl. The filtration surface is so arranged that there is no restriction of fuel even with the largest engine, and 150 gallons per hour can pass through.

The filter unit is self-cleaning. All impurities deposited on the ring edges are continuously removed by the constant swirling motion of the fuel. It can be dismantled quickly and easily without the use of tools. The weight complete is only 27 ounces.

CARL ZEISS (LONDON) LTD., Winsley House, Wells Street, Oxford Street, W.1. Stand No. 115.

This well-known optical firm are showing a number of interesting things for the lighting of aerodromes. The first is the Aeroplane Landing Search-light with a swivelling mirror. The searchlight is rigidly mounted in a streamlined aluminium case with a strong glass cover, and is fixed relative to the fuselage, or it can be built into the wings.

The mirror can be swung up to 30° in any direction, and the spread of the beam is about 12°. The lamp can be focussed, and has a 100-watt bulb with an intensity of 35,000-candle power. The total weight of the searchlight is 13 lbs.

Aerodrome searchlights of 14-inch diameter, giving 130,000-candle power with 500-watt lamps, are also shown. These are mounted on hinged supports, and can be sunk flush with the ground when not required.

A number of these are placed in a circle round certain German aerodromes throwing converging beams on the centre of the ground.

Beacon lights for marking air routes are yet another enterprise of this firm. The lights, which can be arranged for flashing, are mounted on masts at intervals of from 3 to 6 miles. A horizontal beam is thrown of about 3,000 c.p. intensity with a 500-watt lamp.

Another very interesting exhibit is a combined drift and ground-speed indicator, which can also be used as a bomb sight.

The indicator is fixed outside the fuselage on the right-hand side, and consists of a metal cylinder with a glass window at each end. The bottom glass has a wire cross, and the top a small ring for sighting. At the side is a gear-wheel, and a dial showing the amount of drift, and a clock for timing the ground speed. When the instrument is set at zero it inclines at an angle of about 30°.

The operation is simple. The altitude is first read, and a dial on the instrument set accordingly. An object on the ground is then sighted, and followed by turning the gear wheel until it is vertically beneath the machine, when a pointer springs out on the glass sight.

A glance at the dial gives the amount of drift, if any, and the time taken for the sighted object to get vertically beneath the machine, which gives the ground speed of the machine.

A means of determining the height of clouds is another exhibit of interest. This consists of focussing a searchlight beam on a cloud. At a prescribed distance apart is a telescope attached to a scale marked in degrees. The telescope is focussed on the point where the beam hits the cloud and by reading the angle obtained, the base length of the triangle being known, the height of the cloud can then be calculated.

Where Good Castings Are Made.

PARACHUTES AT OLYMPIA.

"IT IS MORE WORTHY TO LEAP WITHIN OURSELVES——"—Mr. John Tranum, complete with seat and lap type British Russell parachutes, leaving a D.H. Moth, piloted by Mr. M. E. J. Jensen, over the Kastrup Airport, Copenhagen.

THE IRVING.

Five different types of parachutes were shown at the International Aero Show at Olympia. That, by the time that the next Aero Show is held at Olympia, aircraft will be considered so safe and reliable that parachutes will not be included among the exhibits seems within the bounds of possibility. Applications for stand space for them may even be dismissed by the promotors with a contemptuous smile. But in the meantime,—apparently on the principle of the old lady who always curtsied in Church when the Devil was mentioned because, as she explained, "a little politeness cost nothing, and you never know,"—parachutes hold an honourable position at any exhibition of aircraft.

The exhibitors do not disclose the number of visitors to the Show who have applied to them for an active demonstration of the infallibilty and luxury of this method of air travel, but nevertheless a good many people seem to be genuinely interested in them.

Taking the five types in alphabetical order the Irving comes first.

The *Irving* Air Chute, invented and designed by Mr. Leslie Irvin, and manufactured in this country by the Irving Air Chute of Gt. Britain Ltd., at Letchworth, is the standard parachute equipment in the Royal Air Force. It is called the Irving because the person who registered the parent firm in the United States did not know how to spell Mr. Irvin's name.

Since it was adopted it has saved the lives of 16 Service personnel and three civilians. The number of lives saved by parachutes made by the parent company in the U.S.A. is too great to record.

The Company's stand at Olympia shows three types of packing: the Seat type for pilots, the Lap Pack for observers, gunners and photographers and the Back Pack for use in lighter-than-air craft.

Irving Air Chutes are made in three sizes, 24 feet in diameter for general service use, 28 feet in diameter for exhibition and training jumps and 22 feet in diameter for use in conjunction with the 28 feet one for exhibition and training jumps.

The design and construction is the same for all sizes and in all kinds of pack.

A new type of pack was also exhibited on the stand. With this type the aviator wears the harness and keeps the pack in a handy position in the machine. There are two clips on the front of the harness and the pack snaps onto them with one movement. The parachute operates equally well with only one clip fastened. The straps of the harness are lightly stitched down the front, which stitching gives when the parachute opens, suspending the pilot from the middle of his back as in the other types of packing.

The harness consists of webbing of a tensile strength of 3,000 pounds and is reinforced on all metal parts. It is easily adjusted to fit anybody and is so designed that no

"——THAN TARRY TILL THEY PUSH (OR PULL) US."—A simultaneous pull-off by six airmen with Irving Airchutes from three R.A.F. Vickers Vimy biplanes.—(*With apologies to Shakespeare, Julius Cæsar, and all concerned.*)

Digitized by Google

bodily injury can result to the wearer when the parachute is opened at high speed. The metal parts are chrome-nickel steel, with a tensile strength of over 5,000 pounds and are either galvanised or cadmium plated.

The fabric is a specially woven high grade silk and the suspension or shroud lines are silk cords of 400 pounds tensile strength. These cords are continuous from their point of attachment from one side of the harness to the other passing through and over the top of the parachute. The pilot parachute is attached to the main parachute by means of a separate silk cord of 400 pounds tensile strength. The action of the pilot chute provides a means of deploying the parachute away from the aviator and thus eliminates any chance of his becoming entangled in the main parachute.

The Irving parachute can be folded and packed in its container in a very simple manner and without any tools or equipment. The rip-cord which secures it is of flexible aircraft cable with locking pins on one end and a steel ring on the other. The average time for the parachute to open and assume normal descent is approximately 1 and 3/5 seconds after the hip-cord has been pulled. An officer of the U.S. Air Corps saved his life with an Irving Air Chute when his controls failed at 150 ft.

THE ROBUR.

The Robur Parachute was represented at the Show by Carl H. Lundholm A-B. of Stockholm. The Robur parachute is produced by the manufacturers of the Thörnblad parachute and many of the devices of the latter are produced in the Robur. The special features claimed for this parachute are (1) The static release device which operates independently of the manual release; (2) both the release devices are well protected on the container; (3) the opening of the container is effected by one single elastic cover coiling up to either side; (4) the pilot chute is packed separately from the main parachute; (5) the pilot chute is fitted with harness of new and improved construction; (6) the manual release device can be easily disconnected from the container and the harness.

The free end of the static line is attached to a suitable place in the cockpit or cabin. When the aviator jumps the seal of the pocket which holds the static line is broken. The line is drawn out of its container and then draws out a steel wire. This releases a cover fitted with rustless springs or elastic which coils up and releases a pilot-chute. The pilot-chute fills with air. Its lines are stretched and draw two short pins out of two flexible loops. This frees the flaps covering the main parachute and draws it from the pack. The constructors claim that this method of packing the pilot chute separately from the main parachute eliminates the possibility of the pilot chute being driven between the shroud lines of the main parachute by the airscrew stream.

The Robur parachute is fitted with a manual release in addition to the static one. The canopy is made of Japanese silk or cotton of high quality. The shroud lines are of silk of 450 pounds strength.

THE RUSSELL.

The British Russell "Lobe" Parachute is made by the British Russell Parachute Co. Ltd., of Dominion Works, Dunsmure Road, Stoke Newington, N.16. The Russell parachutes are made in silk or specially constructed cotton material and are equipped with the Company's new improved adjustable harness and positive-action manually-operated packs.

A jerk of the release ring frees and ejects the parachute from the pack and there is no pilot parachute and no rubber elastic or springs.

The packs are of 12 oz. double-fill O.D. duck, with .080 piano-wire pins. The joints are wrapped, soldered and tested, rip-cord rings are made of seamless steel tubing cadmium-plated. The release-ring and rip-cord attachments are so constructed as to make it practically impossible to rip the pack except by pulling the ring after it has been removed from its pocket.

The constructors claim that the parachute operates safely at 100 feet. Oscillation or swinging is reduced to a minimum by a specially designed lobe-type canopy. It is easily controlled during descent with the means provided for partial collapsing and hastening descent. The Russell parachute can be easily packed and operated by inexperienced persons.

The Russell parachute is well known to those who attend flying meetings in this country and have so often watched Mr. John Tranum make exhibition descents with one.

THE SALVATOR.

The Salvator Parachute is manufactured by S. A. Brevetti Aeronautici "Salvator," Rome. It was invented by Giuseppe Furmanik and Prospero Freri and the first model was constructed in 1922. In 1925 it was adopted by the Royal Italian Air Force.

The Salvator parachute can be released automatically or by hand. It opens within 1½ seconds. The deformable cap allows of a relatively rapid escape of air which moderates the shock to the aviator at the moment of opening.

The makers claim that the Salvator parachute and harness weigh considerably less than any other standard make of parachute and harness. This is because the straps and braces of ordinary harness have been replaced by a broad belt of simple and compact design. This belt has a light webbing strap over one shoulder to keep it in place. The parachute pack is worn on the back and has been designed to be as comfortable as possible to the wearer.

THE VINAY.

The Vinay Parachute is manufactured by Louis Vinay, 67, Boulevard Bessieres, Paris 17e. This parachute is made so as to open quickly and to descend slowly. It can be had with a canopy of silk or cotton and it is packed into a variety of containers.

The most novel form of packing is the Vinay parachute suit which is a leather flying-suit and parachute-pack all in one. This parachute-suit is intended for observers, photographers or others who require freedom of movement in aircraft. The Blériot, Hanriot, Farman, Caudron, and other Flying Schools have adopted the Vinay Parachutes.—C. M. MCA.

HOW TO SPEND A HOLIDAY.

At 22.17 hrs. on July 28 a Curtiss Robertson Robin monoplane (Curtiss Challenger engine), piloted by Messrs. Dale Jackson and Forest O'Brien had succeeded in remaining in the air for 351 hours and were still flying.

A message dropped by the pilots onto the St. Louis Airport, over which they are flying, said, "We don't know how many more hours we have left in our ship and motor, but we are going to find out. So far the flight hasn't bothered either of us and we can last out as long as there is any run left in the motor, which doesn't seem to be weakening."

So far they have beaten the previous record of 246 hrs made in California. Another competing machine in Texas has been forced down after 233 hrs.

On July 29 a machine which had started at Minneapolis piloted by Messrs. P. J. Crichton and Owen Hangland in an attempt to beat the Robin, crashed near Minneapolis after 155 hrs. flying. Mr. Crichton was killed outright and Mr Hangland died later from his injuries.

At noon on the same day the Curtiss-Robertson Robin had completed 387 hrs.

And so it goes on.

RECORDS FOR WOMEN.

At the recent meeting of the *Fédération Aéronautique Internationale* at Copenhagen the delegates agreed to recognise a category of Records for Women.—One gathers that the representative of the Royal Aero Club, Lt. Col. Mervyn O'Gorman, strenuously opposed this stupid decision.

One has always been in favour of Votes for Women, as it puts women in the same category as men. Records for Women puts women into a different and inferior category. Convinced feminists should be violently opposed to any regulation which puts women in a class apart and thereby advertises feminine inferiority.

ANOTHER FEMININE RECORD.

On July 28-29 Mlle. Maryse Bastié, flying a Caudron monoplane (40 h.p. Salmson engine) over Le Bourget Aerodrome succeeded in remaining in the air for 26 hrs. 46 mins. This exceeds by 24 mins. the previous longest flight made by a woman.

Presumably there is evidence that this aviatrice was not accompanied by a male pilot of the first class as she was when she laid claim to a feminine long-distance record some time ago.

A DISCLAIMER.

During the Aero Show a booklet was distributed bearing the title *Conquering the Air* and purporting to be written "By C. G. Grey, Editor of THE AEROPLANE." One desires to dissociate oneself from the contents of the said booklet.

Some weeks before the Show one was asked to write an article on certain great flights in which the products of the Wakefield firm were used. Having the greatest possible respect for Sir Charles Wakefield and the valuable work that he has done for Aviation, and hoping that an article on these flights might in some little way help Sir Charles Wakefield's work, one did in fact write an article which might have formed the contents of this booklet if it had been let alone.

Unfortunately, whoever were responsible for producing the booklet have mangled the original article to such an extent, have re-written it into such painful journalese, and have put into it so many phrases and so many sentiments entirely unlike any that one would personally express, that one is regretfully compelled in self-defence to disclaim the authorship.—C. G. G.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Digitized by Google

AN ITALIAN LIGHT AEROPLANE.—The Romeo Ro.5 two-seat monoplane (85 h.p. Fiat A-50 engine) built by the Officine Ferroviarie Meridionali of Naples.

THE ROMEO Ro.5.

One of the most interesting foreign light aeroplanes exhibited at Olympia was the Romeo Ro.5, a two-seat light aeroplane built by the Italian firm known as the Societa Anonima Officine Ferroviarie Meridionali, of Naples.

At the Italian Government Trials held at the Montecelio aerodrome, near Rome, this year, the Ro.5 put up a remarkable performance. The machine was the fastest, had the greatest speed range, and had the best take-off among the competitors, and finished first in the severe test of 100 hours' flying and 100 landings. During these trials the strength of the fuselage structure and undercarriage was amply demonstrated.

Any make of engine, either radial or in-line, of from 80 to 100 h.p., may be fitted to this machine.

In the machine shown at Olympia, the 85 h.p. Fiat A-50 seven-cylinder radial engine was installed.

SPECIFICATION.

TYPE.—Two-seat light monoplane with folding wings.

WINGS.—High-wing monoplane. Wings in two outer panels attached to small centre-section. Spruce spars of rectangular section of constant depth but diminishing thickness. Ribs have plywood webs with flanges of ash and reinforcing pieces of linden. Drag bracing consists of duralumin struts and piano-wire bracing. Wing covered with fabric, leading edge being reinforced with plywood. Narrow cord ailerons hinged along whole of outer wing panels. These ailerons can be operated as flaps to increase lift. The wings are braced with streamline steel-tubes arranged in the form of "N"s hinged to fittings on lower longerons, with the front legs attached to pyramids carrying the undercarriage shock-absorbers. For folding the front bracing struts are detached, and the ailerons folded up on the wings. The wings then hinge back on the rear spar and rear bracing strut fittings.

FUSELAGE.—Rectangular section welded steel-tube structure. Rigidly braced with steel tubes to aft of the rear cockpit, thence by piano-wire to the tail. Fabric and plywood covering.

TAIL UNIT.—Normal monoplane type. Structure similar to wings with fabric covering. Control surfaces unbalanced.

UNDERCARRIAGE.—Wide-track divided axle-type. Steel-tube Vees, hinged to lower fuselage longerons with telescopic legs sprung with elastic shock-absorber, hinged to pyramids carrying bracing struts. Ssock-absorber travel is nearly 10 in. Tracking tail skid of steel tube.

POWER PLANT.—One 85 h.p. Fiat A.50 air-cooled engine, though any other type of engine of from 80 to 100 h.p. may be fitted. Two fuel tanks of 70 litres (15½ galls.) each are placed in wings, one on each side of fuselage. Gravity feed to engine. Oil tank of 15 litres (3¼ galls.) capacity carried on engine mounting.

ACCOMMODATION.—Two cockpits in tandem. Both may be entirely enclosed by glazed panels reaching from fuselage to centre-section. Wide doors to each cockpit. Dual control of normal type is fitted with a quick release so that the instructor may immediately disconnect pupil's controls. The flap gear is operated by a small screw in front of pilot on dashboard.

DIMENSIONS.—Span 11.22 m. (36 ft. 11 in.), Length 7.050 m. (23 ft. 3 in.), Wing area 19 sq. m. (205 sq. ft.), Width folded 3 m. (9 ft. 10 in.)

WEIGHTS AND LOADINGS.—Weight empty 400 kgs. (882 lbs.), Disposable load 280 kgs. (617 lbs.), Weight loaded 680 kgs. (1,499 lbs.), Wing loading 35 kg./sq. m. (7.17 lbs./sq. ft.), Power loading 8 kg./h.p. (17.6 lbs./h.p.).

PERFORMANCE.—Maximum speed 170/180 km./hr. (105/112 m.p.h.), Cruising speed 150/155 km./hr. (93/96 m.p.h.), Landing speed 60/65 km./hr. (37/40 m.p.h.), Service ceiling 5,000 m. (16,400 ft.), Range 1,000 km. (620 miles).

INDIAN AIR MAIL NEWS.

The homeward-bound mail from Karachi was unable to start last Sunday because the aerodrome was unsafe owing to heavy rains. The machine left a day late, on Monday and should be able to make up the lost time by making longer hops, the first being from Karachi to Bushire instead of to Jask.

The outward-bound mail arrived at Karachi on Monday evening instead of Saturday owing to unusually bad weather. The first delay occurred between Baghdad and Basrah. A severe sandstorm between these two places forced the machine to return to Baghdad, where it was delayed for two days. On reaching Jask the mails were again held up, this time because the aerodrome at Karachi was flooded after a 18-hour downpour.

A COLLISION AT STAG LANE.

On July 29 two D.H. Gipsy Moths, one piloted by Mr. A. S. White with Mr. F. L. Knight as passenger, and the other flown by Capt. G. F. Boyle alone, collided at a height of about 800 ft. near Stag Lane Aerodrome. Both machines were wrecked and all three occupants were killed.

Apparently Mr. White, who was chief demonstration pilot to the De Havilland Aircraft Co. Ltd., was gliding in to land when the other machine, approaching from the opposite direction, flew underneath it and the wings of the two machines touched.

The first machine fell into a field and was completely wrecked and the second machine fell some 200 yards away and almost immediately burst into flames.

ARCHER STATHAM WHITE, A.F.C.

Flt. Lt. A. S. White, known to all his friends as "Jimmy" has for some years been one of the best-liked people in civil aviation. He joined the De Havilland firm about seven years ago and after considerable experience as an air-taxi pilot was made chief pilot of the De Havilland School. With the last few months he has been appointed as demonstration pilot to the firm and in that capacity he demonstrated Moths to possible purchasers, anywhere and at any time.

He was one of the very finest instructors. He had an almost uncanny way of imparting his knowledge to pupils and his manner instilled confidence into the most nervous.

One has had the privilege of doing a certain amount of flying with him lately and one had unfailing faith in him. And one knows how very much his friends will miss him.

To his wife and family one offers the sympathy of all those who were proud to number Jimmy among their friends.

—G.

Corresponding week, 1920:

Machines, 115; Passengers, 240; Crews, 144; Total personnel, 384.

FINANCE FOR CIVIL AIR PORTS.

In the House of Commons on July 26, Mr. Harold Balfour asked the Lord Privy Seal whether the provision of financial assistance to local authorities or private concerns for the purpose of aiding the construction of provincial civil airports in England and Scotland can be considered in conjunction with other schemes for work to be undertaken during the coming winter for the relief of unemployment.

Mr. Thomas: In so far as such works are carried out by local authorities it will be open to them to make application for assistance under the Development (Loan Guarantees and Grants) Bill. Indirectly Government assistance is already being offered for such projects under the agreement which is being made with National Flying Services Limited.

A WARNING TO WING-WALKERS.

Air Ministry Notice to Airmen No. 41 of the year 1929 warns Wing-Walkers as follows:—

(1) The attention of all concerned is directed to the structural damage which may be caused through demonstrations of "wing-walking" being carried out during flight on light aeroplanes such as the De Havilland Moth, Avro Avian, Blackburn Bluebird, Simmonds Spartan, etc.

(2) If the practice of "wing-walking" on the type of aircraft referred to above is pursued, it will be necessary for the Air Ministry to prohibit it under Article 9 (4) of the Air Navigation (Consolidation) Order, 1923.

A BOMBAY GROUSE.

The Bombay correspondent of *The Times* writes as follows:—

The statement by Mr. Wedgwood Benn in the House of Commons yesterday that the Government of India had decided to give the Karachi-Rangoon air mail service priority over the Karachi-Bombay service has been received with indignation by the Bombay commercial community. The Bombay Chamber of Commerce wrote to the Government of India in the first week of June, pointing out the necessity for the establishment of an air mail service between Bombay and Karachi.

The Chamber stated that Bombay, one of the most important cities of the Empire, was placed at a great disadvantage by not being in direct aerial communication with the air service to Karachi, although mailed matter received at and dispatched from Bombay formed a large part of the total mail. The demands of the Bombay Chamber of Commerce have since been strongly supported by all the leading chambers of commerce of the Bombay Presidency and South India. At present it takes mails more than two days reach Bombay from Karachi.

This grouse seems justified to some extent. The whole point of an air mail service is lost if there are delays at either end. A two-day delay between Karachi and Bombay is obviously bad, and steps should be taken to link Karachi and Bombay more closely. But the millionaire business community of Bombay could well afford to run an air line of their own to take their mail to and from Karachi.

The whole point about going through to Calcutta is that the Indian line is merely a short link in the great Imperial Airway (Strategic as well as Commercial) to Australia.

THE A.D.C. AIRCRAFT LTD. SPORTS.

The Athletic Club of A.D.C. Aircraft Ltd. held their annual sports at Croydon Aerodrome on July 27. Many spectators were present including Lt.-Col. J. E. Barrett Lennard, Mr. and Mrs. Henry Morgan, Mr. A. W. Haschke, Major Jack Stewart, Capt. R. Walker, Mr. E. Olney, and Mr. Neville Stack.

The latter gave a fine exhibition of aerobatics on a Hermes-Moth which aroused great enthusiasm.

The main prize winners were:—100 yds. handicap, A. C. Johnstone; 220 yds. and 440 yds., L. Greaves; 880 yds., H. Green; 1 mile, W. Hills; 100 yds. veterans and 1 mile walking, H. Peck.

The Silver Trophy for the Department winning the most events was won by the Machine Shop. The Trophy for the individual winning most events resulted in a tie between L. Greaves and H. Peck.

The Clerk of the Course was Mr. A. H. Capel, designer of the Hermes, who proved that he can manage sports as efficiently as he can manage the intricacies of design.

PERSONAL NOTICES.

DEATH.

WILLIAMSON.—On July 27, at Coventry Hospital, the result of a flying accident, Jock, second son of Mr. and Mrs. Williamson, Heligan, Pentewan, Cornwall, aged 21 (R.A.F.O.).

BIRTHS.

BENSON.—On July 23, to Eva, wife of Flt. Lt. Stewart Benson, A.F.C., R.A.F., of Anna Valley, Andover—a son.

DAVIES.—On July 24, at Waverley Court, Camberley, to Aldyth (*née* Tudor), wife of Flt. Lt. E. D. H. Davies, R.A.F.—a daughter.

YARDE.—On July 22, at Tangmere, Chichester, to Marjorie, the wife of Flg. Off. Brian C. Yarde, R.A.F.—a son (stillborn).

MARRIAGES.

BURTENSHAW—M'QUEEN.—At St. Peter's, Meavy, South Devon, on July 24, Lieut. Jack Burtenshaw, R.N., only son of Sq. Ldr. A. Burtenshaw, O.B.E., M.C., R.A.F., to Margot, only daughter of Eng. Capt. B. D. M'Queen, R.N., retd., and granddaughter of the late John M'Queen, Grotchet Knowe, Galashiels.

DRUMMOND—DRAKE-BROCKMAN.—On July 17, at St. John's Church, Toorak, Melbourne, Australia, Sq. Ldr. R. M. Drummond, D.S.O., O.B.E., M.C., R.A.F., to Isabel Rachael Mary Drake-Brockman, only daughter of the late Paris Frederick Drake-Brockman, of the Inner Temple, and of Mrs. Drake-Brockman, of Cintra Park, Upper Norwood.

PEARSON—FRITH.—At Grantham, on July 24, Flt. Lt. Wilfred Joshua Pearson, to Irene May, daughter of Mr. and Mrs. W. G. Frith.

TAIT—BROOKE.—A marriage took place on July 26, between Flt. Lt. V. H. Tait, R.A.F., and Miss Phyllis Brooke, only daughter of Brigadier-General H. F. Brooke, C.B., C.M.G., C.B.E.

TAYLOR-HURRELL.—On July 10, at Bristol, Maj. F. C. W. Taylor, Education Officer, R.A.F., to Mrs. Renée Hurrell, of Stoke Bishop (Nine Elms, Heckington, Lincs.)

FORTHCOMING MARRIAGE.

BUXTON—FISHER.—The engagement is announced between Geoffrey Mungo Buxton, R.A.F., eldest son of the late Commander Bernard Buxton, D.S.O., Royal Navy, and the late Lady Hermione Buxton, and Horatia Mary, younger daughter of Vice-Admiral Sir William Fisher, K.C.B., C.V.O., and Lady Fisher.

SCOTT—WHARTON.—The marriage arranged between Charles Edward Scott, M.C., R.A.F., late Sherwood Foresters, third son of the late Mr. James Scott, of Dublin, and Mrs. Scott, and Kathleen May, only daughter of Mr. A. Wharton, Bircham Tofts, King's Lynn, will take place at Karachi on Oct. 3.

DOPED WITH

A.B.C. "Robin."

CELLON

The dope of proved efficiency

Single-seater cabin monoplane designed by A.B.C. Motors, Ltd. These machines will be constructed by S. E. Saunders, Ltd., Cowes, Isle of Wight, a large order having been placed for them by National Flying Services, Ltd. The "Robin" was exhibited at Olympia, doped with Cellon in N.F.S. colours, the fuselage being lacquered with "Cerric."

Cerric Cellulose Lacquers comply with D.T.D. Specifications for metal parts, cockpits, propellers. Particulars on application.

ON THE CHALLENGE INTERNATIONAL DE TOURISME.

That is a fine title. Is not it? And Tourism is a good word which is worth adopting,—for it means rather more than the mere act of touring.

Last year the event from which this great International Competition has grown was merely a tour of France,—and we all knew it as the Orly Meeting, because it began and ended at the Orly Aerodrome to the South of Paris. This tour also begins and ends at Orly. But the course takes the competitors to nearly all the capitals of civilised Europe. So it is truly international. And it is truly a challenge from one nation to another.

In particular the competition is a challenge from Germany to the rest of Europe.

Originally there were 82 entries. Of these, 34 were entered by the Aero Club of Germany. They included one entry (Lord Carbery), who this time claimed to be a Canadian, and one Austrian.

There were 28 entries by the Aero Club of France. These included one Brazilian, one American, one Franco-American, five British, two Belgian, and two Yugo-Slav—leaving only 16 actual French entries against 32 German.

There were 14 Italian entries,—as usual with orders from Il Duce Mussolini to win or crash. There were four Czechoslovak entries. And there were two Swiss.

The machines had to arrive at Orly by midday on Saturday last,—but most of them were there on Friday. Those which were in time, 55 in all, were:—

Germany,—24 machines—including 8 B.F.W.'s; 2 Raab-Katzensteins; 1 D18 (Darmstadt Akademische Fliegergruppe); 2 Albatroses; 6 Klemms; 1 Arado; 1 Focke-Wulf; and 3 Junkers.

France,—14 machines—including 3 Caudrons; 1 Guerchais; 5 Potez; 2 St. Huberts (Belgian); 2 Moths (British); and 1 Icarus-Michlovitch (Yugo-Slav).—So there are only 9 French machines in all.

Italy,—12 machines—including 4 Fiats; 1 Cantiere Navale Triestino; 4 Officine Ferroviarie Meridionale (Romeos); and 3 Bredas.

Czechoslovakia,—3 machines—including 2 Avias (Antilopas); and 1 Aero.

Switzerland,—2 machines—both Klemms, and therefore German aeroplanes.

THE MOTORS.

The motors used by the various national clubs and manufacturers were as internationally mixed as the entries. They were:—

Salmson 13,—to wit, 5 in French machines, 5 in German machines, 2 in Swiss and 1 in a Yugo-Slav.

Siemens 8,—all in German machines.

Fiat 8,—all in Italian machines.

Cirrus 7,—3 in German machines, 3 in Italians; and a Hermes in a German machine.

Walter 6,—3 in Czechoslovak machines, 2 in Belgians, and 1 in a German.

Genets 5,—all in German machines.

Renault 3,—all in French machines.

Gipsy 3,—2 in British machines, and 1 in a German.

Anzani 1,—in a French machine.

Isotta-Fraschini 1,—in an Italian machine.

The methods of cowling were as variegated as the machines into which the engines were fitted. And one fancies that the cowling will cause the downfall of many a good motor. There is a great deal to be said for the idea instituted by the Cirrus motor firm, which is that the engine-maker should discover what sort of cowling best suits his own motor, and that the cowling and mounting should then be sold as part of the complete power-plant, ready to bolt onto the fuselage,—which would be designed to fit.

Some of the machines at Orly are so boxed-in that they will certainly over-heat, and others are left with their cylinders sticking out so that they must spoil the performance of the machines.

One point to be noted is that there are no machines with two-cylinder or three-cylinder engines. Four was the minimum, and most had five or nine.

Taking them all round, the machines at Orly showed remarkable advance in the design and construction of light aeroplanes on the Continent. They were enough to show anybody that unless we go ahead in this country we are going to lose our much-prized lead in light aeroplanes.

OUR LOST CHANCES.

The great pity is that there were not more British entries. Originally there were four. Lady Bailey arrived late. The Moth which she intended to fly was a brand-new one, and for some reason could not be got ready in time. Consequently she was disqualified. Mr. Staniland and the Spartan did not appear at all. That left only Mr. Broad and Miss Spooner. But Lady Bailey, always a sportswoman, is flying round the course with the rest.

AT ORLY.—One of the big airship sheds and the door of the other. The Romeo Ro.5 monoplane (Fiat motor), flown by Gelmetti, is in the foreground.

Digitized by Google

AT ORLY.—Looking towards the aerodrome. The Arado and one of the Bredas are noticeable.

The British entries were made through the Aéro Club de France, so our two representatives are flying under the French flag. The reason the Royal Aero Club took no part in the competition was that each country participating had to pay 20,000 francs to be represented, and, as there seemed no prospect of any considerable number of British machines being entered, the Royal Aero Club did not feel like putting down nearly £200 for the sake of entering only three or four machines.

Also there was a certain amount of soreness in England over the last Orly competition, because the prizes which were won in September of last year were not handed over to the winners until about January of this year, and so people who were concerned in the competition last year were not keen on entering this year.

Those who might have entered for the competition probably omitted to notice that whereas last year's competition was run by an independent concern—merely under the rules of the Aéro Club de France—this year's competition is being run by the Aéro Club de France itself, and is therefore being properly conducted. Anyhow, by not entering for the competition we English have lost another magnificent chance of advertising our aircraft to the world.

Affairs at Orly.

Last year at Orly the whole thing was more or less of a joke. People rushed around frantically and pulled machines on and off scales and did all kinds of funny things with them. This year everything was done with a machine-like precision which was wholly admirable and businesslike. The result of all this precision was in fact to make the proceedings rather dull, but they were distinctly interesting.

But, apparently, the Aéro Club de France, like our Society of British Aircraft Constructors and our Society of Motor Manufacturers and Traders, is not interested in interesting the public in aviation. And the Aéro Club de France went rather further than we did in hiding aviation from the public gaze.

We did at any rate allow people of leisure to come to our Aero Show, even though we kept the mere vulgar public away by throwing them out at nine in the evening. The Aéro Club de France went one better than that. The competing machines were housed this year in a great airship shed at Orly, on the south side of the aerodrome, which belongs to the French Naval Aviation Service. And none is allowed to penetrate there without a special permit.

Last year the machines were housed in the ordinary civil sheds on the west side of the aerodrome, and the members of the public who were interested in flying were able to go into the public enclosure of the aerodrome and hang over the fence and watch what was going on. This year nobody can enter the Naval Airship Station except those who are provided with the necessary badge or brassard by the Aéro Club de France. And as the Naval Airship Station is the better part of a mile away from the Civil Air Station, the public can see nothing—except machines in the air, when they happen to pass over that way.

Consequently on Sunday, although tens of thousands of people must have passed the aerodrome on the main road to Fontainebleau, one of the most popular Sunday resorts for Parisians, there cannot have been at most more than a thousand or so privileged beings on the aerodrome.

A Matter of Catering.

The one thing about the organisation at Orly which was thoroughly bad was the arrangement of food supplies. The sanitary arrangements were not bad, for the simple reason that there were none at all.

Naturally there is always great difficulty in catering for anything like a crowd in an out-of-the-way place like an aerodrome, but at any rate the catering people could have found out how many pilots and passengers and mechanics there were, and roughly how many permits had been issued to other people, and could have made some sort of a shot at catering accordingly. But they did not. The result was that the people who went to lunch first got whatever there was, and those who came later got no service, although there seemed to be plenty of food about.

On Sunday one went to lunch with Mr. Earl Osborn and Mr. Percival. We waited an hour-and-a-half, because the waiters said that we were due for the third service and they were still serving the second. And then when the people who had been lunching disappeared the waiters still did nothing. At long last one of them brought a yard or so of bread. Then, after repeated calling, another one brought a bottle of beer. After that Mr. Osborn raided the kitchen and stole three plates of meat. After that, seeing that we were determined to have something, yet another wai

AT ORLY.—The Marine Airship Station.—In the fore ground is the little Baumer Sausewind, which arrived too late to compete, and was disqualified.

After the Show!

NOW you have had an opportunity of studying all the leading engines of the world, may we remind you that the Napier engine has demonstrated its reliability and efficiency in the following up-to-date performances.

THE FIRST NON-STOP FLIGHT FROM ENGLAND TO INDIA was accomplished by a Royal Air Force Fairey monoplane fitted with **NAPIER** engine —**4,130** miles in 50 hours 38 minutes.

THE FIRST FORMATION FLIGHT FROM ENGLAND TO AUSTRALIA was achieved by four Royal Air Force Supermarine "Southampton" flying boats each fitted with two **NAPIER** engines—**180,800** engine miles without mechanical trouble.

THE HIGHEST SPEED IN THE AIR was accomplished by Flight Lieut. D.D'Arcy Greig with a Supermarine seaplane with **NAPIER** engine—speed **319½** m.p.h.

THE HIGHEST SPEED ON LAND was set up by Major Sir Henry Segrave on his Irving-Napier special with **NAPIER** engine.

Captain Malcolm Campbell set up world's land speed records for 5 miles and 5 kilometres with his Napier engined car.

No other engine has such a record of achievement.

THE CAUDRON C-190.—A new low-wing monoplane (85 h.p. Renault four-cylinder-in-line engine) flown by M. Barbot.

brought some cheese, and then another offered some ices, but never brought them.

When we had finished they charged us 25 francs apiece for a lunch which would have been dear at 10 francs, and had the impudence to ask for a tip for the *service*,—which they did not get.

Incidentally, a pleasing contrast to this inefficiency was the comfort and civility at the Hotel Regina in the Rue de Rivoli. It is one of the big hotels of Paris and the accommodation is very good indeed, but the prices are no higher than those of a lot of the little hotels tucked away in back streets to which people go because they think they are cheap. The Regina is at the corner of the Place Rivoli and one side of it looks out onto the Tuileries Gardens, so it is quite in the best part of Paris. One can recommend it strongly to anybody whose finances and tastes do not quite run to Claridge's or the Lotti or the Chatham.

A French Criticism.

The French themselves do not seem to be any more pleased with the efforts of the French Aircraft Industry in this great International Competition than we have reason to be pleased with our own commercial enterprise.

That excellent paper *L'Aéro-Sports*, which has a way of speaking its mind as frankly as The Aeroplane does, issued a Special Edition, gratis, on Saturday, August 3, in which a writer signing himself "Chignole" tells the French something about themselves, for their own good, thuswise:—

Poor France! On the first day of the Meeting Orly exposes to the eyes of the world the great pity of our Aviation.

Quite happy at going to assist at a brilliant aeronautical competition we spun gaily along the beautiful road to Fontainebleau to the Aero-Port of Orly, where the 82 entrants for the Aerial Tour of Europe ought to find themselves united. We knew that this year, contrary to the preceding French participation in this kind of test would be important and that at least we would be able to defend ourselves. Interesting efforts, although tardy, had been made by our constructors, and we were going to see . . . exactly the contrary to what we *thought* we were going to see.

As soon as we crossed the sill of the hangar we had a slight shock to the heart. Under the same roof which still shelters some ancient aircraft, which certainly were not, even in the prime of their youth, very beautiful samples of our aeronautical fauna, there found themselves, ranged as on parade, squadrons of toy avions, German, British, Italian, Yugo-Slav, Czechoslovak, etc. . . . Of French competitors, not the tail of one, let alone the wings.

According to certain augurs, arguing the point on the aerodrome, this seemingly was a regrettable delay solely due to a last scrupulous over-elaboration of an ultimate tuning-up before tackling the test. What a profound error. The truth, alas! was quite otherwise. Little by little indiscretions filtered into the conversation. We learned one after another that A—— had declared forfeit; B—— likewise; that C—— had one of his machines (assembled in all haste, according to the eternal rite) too heavy, and that the second had not got its motor that morning; that G—— was still held up at Le Bourget for his Certificate of Navigability; and that P——'s outfit was not yet perfectly fit. Moreover, among all these aircraft, a certain number had never flown, had not even been put into the workshops a fortnight ago.

To insist would be painful. For the *n*th time, this year as in preceding years, French constructors have not understood that a competition of this importance is not an improvisation. For the International Challenge of 1929, as for the mobilisation of 1914, we were not ready. There is, however, a slight difference, which is that in 1914 it was necessary that everything worked, whereas to-day the safety of France did not exact anything more than that our constructors should press themselves. For the sake of our prestige a decent abstention would have been preferable, and the word forfeit takes in the circumstances a singular significance.

What a lesson all these nations give us, great and small, with their clear organisation, the impeccable presentation of their machines, the manifest superiority of their realisations.

To understand this it is necessary to have seen the fine Junkers Junior, a two-seater of 320 kilos, entirely metallic; the majestic Klemm, arriving in squadrons over the aerodrome; the graceful interior-drive Breda; the elegant Romeo; the bright-red Fiat; the curious Ikarus and Aerotovarna; the classic and rapid De Havilland Moth—all these machines, perfectly fit months ago, and here with their chances of winning, handled by pilots sure of their performances.

M. Chignole continues by saying that for twenty years French Aviation has taken part in competitions, and that he has followed them for nineteen years. Until recently he has been forced to believe in miracles. But he does not believe in them any more; he records simply, with a certain bitterness, because of the bankruptcy (mental) of French Aviation.

The Treaty of Versailles, he says, which was intended to kill German Aviation, has only perfectioned it. One cannot bridle with treaties the qualities of intelligence, method and adaptation of a laborious and sportive people. The Germans have not to-day any aviation of war. France has, and is far advanced, but in commercial and touristic aviation France will be, or even is, tributary to foreigners. And these, says M. Chignole, are the branches of aviation with which one has to count in these Locarnian times.

Continuing, he says that the French war machine (which he disrespectfully calls *zincs de guerre*), of 500, 600, and 700 horse-power, are wiped out from the point of view of performance by dwarfs of 70 h.p., which are doing their 200 kilometres an hour.

M. Chignole consoles himself, and France, with the fact that the national motor, the Salmson, equips not only those few French machines which are fit to enter the Tour of Europe, but also the imposing German team of Klemms, and the Yugo-Slav competitors, and he hopes that the French motor which won last year in a foreign machine will perhaps save this year also, if not the prestige of the aircraft constructors, at least that of the motor-makers. And he has a hope that the last-minute Caudron, put together during

days and nights of hard work, may as an outsider furnish the winner.

FROM OUR POINT OF VIEW.

One congratulates M. Chignole on his brilliantly acid article. One has been trying to do the same sort of thing with the British Aircraft Industry for a number of years. But the Englishman is considerably more pachydermatous than the Frenchman, and perchance M. Chignole may wake up the French Aircraft Industry to a sense of its immediate danger sooner than one is able to wake up our people on this side. Anyhow, one wishes him luck with his good work, and one congratulates him on a very fine literary effort.

The fact remains that our good friends from Germany have, in the slang sporting phrase, "got it all over us" as well as our friends the French. And the only hope for British Aviation, in this great Tour of Europe which is going to impress on the people of every capital on the Continent the progress of civil and sporting aviation, centres in the skill and staying power of that splendid sportswoman Miss Winifred Spooner, with her mechanic Mr. Campbell, and that wonderful all-round pilot Mr. Hubert Broad, with his mechanic Mr. Weedon. Good luck to them!

When one considers the enormous wealth of the British Aircraft Industry as displayed with so much ostentation at Olympia a fortnight ago, the pitiful way in which that Industry has missed the chance of advertising itself in this Tour of Europe is enough to make one weep. But, on the other hand, we can take all the greater pride in the four gallant people who are representing the British Empire. And we should feel particularly proud of Miss Spooner in that she is flying her own machine, bought with her own money, and is not flying as the representative of a firm, though very wisely the De Havilland people have lent her one of their best all-round mechanics.

THOSE AIRSHIP SHEDS.

One arrival at Orly on Saturday, relying for transport as usual on Captain Cyril Turner, A.F.C., late R.F.C. and R.A.F., and now representing Fairchild interests in Europe. He is the unfailing mainstay of British and American aviation people in Paris.

The first thing that struck one was the orderliness of everything. All the 55 machines were parked inside one of the two great airship sheds, which were built at Orly towards the end of the War 1914-1918 for rigid airships of the largest size.

These sheds are in fact about 1,000ft. long by 300ft. wide at the base, by about 250ft. high. They are built of ferro-concrete, practically in the form of half-hoops. Only one of them is actually finished—the other has no doors.

They are really beautiful examples of reinforced-concrete architecture and construction. Mr. Jackaman, who, besides being one of our best pilots of these days, is a constructor of buildings, and in fact built the sheds and the Social Focus at the Heston Air-Park, simply could not tear himself away from these sheds. They seemed to fascinate him even more than the aircraft inside. So we may some day see similar structures in miniature on some of the many municipal aerodromes which we are going to have in this country before very long.

In the shed the machines were arranged first of all according to nations, and then according to teams. The result was that if you wanted to see any particular machine you knew exactly where to go and look for it.

Some idea of the size of the shed may be gathered from the fact that 55 machines with plenty of room all round each machine took up rather less than one-third of the floor-space. The far end was occupied by a small airship of the Naval Air Service,—a kind of baby Astra-Torres with two Cirrus engines, or possibly two Renaults,—and with it were about a dozen amphibians of about the size of the Supermarine Seagull.

The middle one-third of the shed longitudinally was allotted to the 55 competitors. But they only took about one-third of the width. So there was plenty of room for everybody to circulate and to get machines in and out and to shelter from the one or two showers which fell.

AN INTERNATIONAL CEREMONY.

On the Saturday afternoon there was an interesting and quite amusing little ceremony which deserves note because of its curious internationalism. Mrs. Cyril Turner, who used to fly professionally in California some years ago as Andrée Peyre—her family name—acquired an Avro Avian while in England during the Show. So, having flown it to France with her husband as passenger on the last Saturday of the Show, she thought it would be a good idea to have it baptised on the following Saturday at Orly.

CAPTAIN THE HON. HUGH GROSVENOR'S FLIGHT

ROUND AUSTRALIA

ON A "CIRRUS-MOTH"

Our Australian Agents Messrs. Gilbert-Lodge & Co., Ltd., have received the following letter:—

GOVERNMENT HOUSE,
ADELAIDE,
19th June, 1929.

Messrs. Gilbert-Lodge & Co., Ltd.,
188, King Street,
Melbourne.

Dear Sirs,

I must thank you very much for your letter congratulating me on my trip round Australia. I must say that my engine, a CIRRUS MARK II, thoroughly lived up to the reputation that the Cirrus has rightly earned.

Beyond a bit of trouble with one magneto, no engine defects occurred throughout the whole flight, and I never had a single moment's anxiety about the machine at any time.

The petrol and oil consumption remained steady throughout, and I would like to say that the engine was running as well over the last hop as it was during the first, and I am still flying the machine regularly with the same engine.

I have no objection whatever in your using this letter as an advertisement.

Yours faithfully,

(Signed) HUGH GROSVENOR.

P.S.—Would be pleased to get all information about A.D.C. products, particularly "HERMES."

"CIRRUS FOR SAFETY AND SECURITY"!

A BELGIAN ENTRY.—A St. Hubert monoplane (85 h.p. Walter) flown by M. Maus.

The ceremony of baptism was performed by the British Director of Civil Aviation, Air Vice-Marshal Sir Sefton Brancker, assisted by M. Laurent Eynac, the French Secretary of State for Air, and by Mr. F. Montague, the British Under-Secretary of State for Air, and Mr. J. J. Ide, the European representative of the National Aeronautic Committee of America. The machine itself is British-built, and it bears British registration letters, as the property of a Frenchwoman domiciled in France who has acquired British nationality by marrying an Englishman.—Which only shows how international aviation may make us in the end.

The other side of the picture was shown by a persistent rumour which circulated on Sunday and rather upset some of the competitors. This was to the effect that the Polish Government refused to admit to Poland any German, Swiss or Czechoslovak competitors in the competition unless they had special visas from the Polish representatives in their own respective countries.

When one left this rumour was still going strong, and the representatives of these various countries were supposed to be besieging the Polish Embassy, or Legation, or whatever it is, in Paris, with the idea of getting the Polish Government to admit their nationals in the competition on their ordinary passports, without any further argument. The alternatives obviously were either that competitors arriving at Warsaw, according to the itinerary of the competition, would be arrested on landing, or else the Aéro Club of France would have to amend the route to avoid Poland.

Probably the whole thing was merely a rumour, but, anyhow, it was strong enough to cause quite a lot of talk.

Putting Them Through It.

On Saturday and Sunday all the machines were weighed and measured and put through their folding tests—or "width-reducing exercises," as our friend Bradbrooke called them last year. All this was so well organised that there was nothing really funny about it.

About the only amusing incident concerned the two Moths. Mr. Broad and his mechanic had folded the wings of their Moth in 22 seconds. So apparently the Commissaires of the meeting thought that there must be some special fake about it, and asked Miss Spooner whether she would bring her Moth out and do the folding test against time. She and her mechanic folded their wings in a trifle under 30 seconds. And thus the Commissaires were convinced that the Moth is really quite a handy thing to have about the house.

Quite a number of the machines did not fold or do anything. There are always clever people who will work out ways of sacrificing points under one rule so as to gain points on others. Such wangling was well worth while.

Points To Be Scored.

Points will be awarded thus:—

(1) Robustness of construction; Comfort; Installation of instruments; Arrangements to prevent turning over on the ground (such as using a split axle), and so forth—8 points.

(2) Self-starters for the motor—3 points.

(3) Arrangements for dual control—2 points.

(4) Installation of parachutes—2 points.

(5) Anti-fire arrangements—6 points.

(6) Facility for mounting and dismounting the machine by the crew (pilot and passenger) in less than 15 minutes. Possibility of passing through a door 3 metres wide and 15 metres high. Facility for towing of the apparatus by an automobile—5 points.

(7) Non-opening of the motor or non-changing of cylinders during the Tour—10 points.

(8) Non-use of spare airscrew—3 points.

(9) Non-use of spare wheel—1 point.

Total for Practical Qualities—40 points.

The Consumption Test gives 20 points.

Regularity throughout the Tour counts 35 points.

Speed throughout the Tour counts 70 points.

Total—165 points.

Thus a competitor can afford to sacrifice several point under No. 1, by using a plain cross axle instead of a spli axle, so as to reduce head resistance, and he can sacrific all five points given for dismountable or folding wings, s as to reduce weight, and thus increase his speed, and s decrease his petrol consumption for a given engine.

Furthermore, by sacrificing those few points to increasin speed, a competitor will have a better chance of gettin well ahead on the various stages of the journey.

Doing three or four stages in one day may mean any c several things. It may mean getting ahead of bad weathe it may mean having a day's rest while other people ar still slogging along, and at certain places it does definitel mean winning a prize for being the first arrival.

The Prize List.

The Town of Paris is giving a pair of Sèvres Vases the first competitor to arrive back in Paris.

Bucarest is giving a Cup, presented by Prince Bibesco, the first arrival at Bucarest.

THE WING-FOLDING TEST.—Miss Spooner is amused, while the Commissaires compare watches.

Digitized by Google

Digitized by Google

THE RAAB-KATZENSTEIN.—A pure cantilever monoplane (100 h.p. Hermes) flown by Lord Carbery.

Budapest is giving a souvenir plaque to every participant who survives so far.

Prague is giving a Cup, of Bohemian crystal, valued at 15,000 crowns, to the competitor who has the highest marks up to that point and finishes the competition.

Breslau is giving a prize of 500 marks to the first pilot in each category who lands at Breslau.

Warsaw is giving a prize of unmentioned value, presented by the Minister of Communications, to the first competitor arriving at Warsaw.

Hamburg is giving three Silver Cups, presented by the Senate of the Town of Hamburg, to the first three competitors in each category to arrive there.

Berlin is giving Silver Cups, presented by the Municipal Council of Berlin, to all the members of all the crews which land at Berlin.

Brussels is giving three medals, presented by the Royal Aero Club of Belgium, presumably to the first three arrivals.

The General Prize List is really worth quoting. It only shows how silly our people were not to have a go at it.

The Challenge Cup, a bizarre affair, is valued at 20,000 francs.

The First Prize is 100,000 francs, or something over £800; the Second Prize is 50,000 francs, or about £400; the Third Prize is 25,000 francs, or about £200; and there are seventeen prizes of 7,350 francs, or about £60 each.

Independently of these, the winner will get a Sèvres Vase, presented by the President of the French Republic; an Italian light aeroplane and a gold medal, presented by the Italian Minister for Air, Signor Balbo; a medal presented by the Aero Club of Germany, a motor-bicycle, presented by the Deutsche Industrie Werke of Spandau; and a prize of 1,000 marks from the Dürener Metallwerke if his machine is built entirely of metal.

The passenger in the winning machine will receive a pair of field glasses presented by the Carl Zeiss firm.

If the winner has a French motor, he will receive a six-horse Renault saloon, presented by the Renault Works.

If the winner has a Czechoslovak motor, he will receive a 60-horse engine from the Walter firm.

The competitor who gets the highest number of marks for the practical qualities of his machine, and is among the ten first to finish, will receive a chronograph from the Maison Leroy of Paris.

And the ladies, whether pilots or passengers, will receive scarves presented by the Maison Français de Tissus Rodier.—The only one is Miss Spooner.

In addition, the winner in the first category (machines weighing 400 kgs.) will receive the prize of the Town of Prague, a trophy of the value of 10,000 crowns.

Also in this category, a Gnome-et-Rhone motor-bicycle of 3 h.p. will be presented to the competitor who puts up the highest speed over the complete circuit without penalisation for irregularity.

And in the second category (machines under 280 kgs.), a Gnome-et-Rhone motor-bicycle of 2 h.p. will be given for the highest speed.

THREE KLEMMS.—C.1 (40 h.p. Salmson) flown by Herr Hirth, C3 (70 h.p. Siemens) flown by Herr Hagenmeyer and C.4 (80 h.p. Cirrus) flown by Herr Kirsch.

COMMERCIAL CABLES

The following CABLEGRAM received at 9.10 M. "Via Commercial Cables,"

THE ONTARIO GOVERNMENT HAS HAD TWELVE GIPSY MOTHS IN CONSTANT INTENSIVE OPERATION ON FIRE DETECTION DUTY SINCE THE OPENING OF THE PRESENT OPERATING SEASON STOP IN LESS THAN TWO MONTHS THESE AIRCRAFT HAVE FLOWN AN AGGREGATE OF OVER TWO THOUSAND HOURS AND HAVE GIVEN ENTIRELY TROUBLEFREE SERVICE STOP NOT A SINGLE REPLACEMENT MADE ON ANY GIPSY ENGINE STOP OFFICIALS AND ENGINEERS ALIKE EXPRESS COMPLETE SATISFACTION STOP THE CONDITION OF ENGINES IS SO GOOD THAT THE PERIOD BETWEEN TOP OVERHAULS HAS BEEN EXTENDED TO TWO HUNDRED HOURS.

MOTH TORONTO.

Now comes testimony from Canada of Moth dependability. It endorses once again the Gipsy's claim to unfailing reliability which is evidenced by the Sealed Gipsy Tour—to date 500 flying hours with only routine attention. This engine will be re-installed in a Moth, after the exhibition at Olympia, and the Tour will continue.

AN ITALIAN CABIN MONOPLANE.—A Breda 15 (80 h.p. Cirrus) flown by Signor Mazotti.

Also, there are numerous prizes given by the various nations for the best performance by their own nationals.

No such prize is offered for the British competitors, but probably if he or she should happen to win, he or she will be given a Lunch at the Royal Aero Club—or possibly even at the Savoy.

CONCERNING THE MACHINES.

The whole competition is such a terrific test of men, aeroplanes, and engines that any attempt to spot the winner at this stage would merely be absurd. One can only indicate some of the machines that seem particularly interesting.

Certainly the most exciting machine in the competition is Lord Carbery's. It is a Raab-Katzenstein monoplane with a Hermes engine, and is more like a very large Tiger-Moth than anything else. It is a pure cantilever with wings of extraordinarily thin section for the work they have to do. It has a cross-axle under-carriage and quite small wheels for its size, so Lord Carbery is evidently depending entirely on skill and speed to get him through.

The prettiest machine of the lot is Herr von Bismarck's B.F.W., with a Cirrus engine. He wanted a Hermes, but could not get one in time—and, anyhow, he is probably better off with the well-tried Cirrus III. The machine is enamelled a pale cream with a dark brown top and cowling and it is quite one of the nicest-looking jobs one has seen.

Our two Moths looked very businesslike and creditable, but there was nothing new about either of them. Miss Spooner's machine looks weather-worn—naturally, after the flying it has done. Mr. Broad's blue and aluminium looks brighter.

Of the French machines, the Guerchais is far the most presentable. It has good, clean lines and is well finished.

The Caudrons have that curious angularity and clumsiness which has always marked Caudron design, and has always been redeemed by the ability to stand hard work.

The Potez machines look like miniatures of any American cabin job, and their finish is distinctly rough.

Among the Germans, the Klemms and the B.F.W.'s are very much alike, very workmanlike, but not particularly beautiful. The best finish of all the Germans is on the Arado, mostly bright red enamel with panels of lighter colour on the body and tail.

The Czechoslovak machines all look very smart in that peculiar finish, apparently of varnished aluminium, which is their speciality.

The Italian machines were particularly interesting. They remind one of the British working man who said: "There is no such thing as bad beer, but some beer is better than others." To say that there is no such thing as a bad Italian motor-car is perfectly true. And Italian light aeroplanes seem to come into the same category.

The Bredas are decidedly the prettiest machines. The way their cabins are arranged makes them look at once distinguished and serviceable, and their colouring is particularly attractive. But they seem to have so much stuff sticking up round the engine, and between it and the leading edge of the upper plane, that they strike one as likely to lose efficiency.

The Romeos with their long fuselages squatting low on the ground look efficient, and, one hears, are efficient in the air.

The team of four Fiats are the least good-looking of the Italian machines, but they fly well.

In the Italian Light Aeroplane Competition last year

"FACE" AND "FOFO."—Two Romeo Ro.5 monoplanes (85 h.p. Fiat) flown by Signor Castaldo (M.2) and Signor Guazzetti (M.3).

When You Are Flying Over Unfamiliar Ground

or when landmarks are obscured, you can always rely on the Pioneer Magnetic Compass

Pioneer Magnetic Compass
Actual Size

Depth—face to rear—
3½" without electric light
4⅜" with electric light
Weight complete, 2 pounds

Since its organization on March 1, 1919, the Pioneer Instrument Company has devoted itself exclusively to the design, development and manufacture of aircraft instruments and equipment.

Pioneer Compasses have been the accepted American standard for the past ten years. The model illustrated is the result of years of development in the laboratory and in the air.

New features are: the round dial type of mounting, making the compass uniform in appearance with the new standard size Pioneer Instruments; an improved resilient mount which effectively insulates the Compass against engine vibration; a concealed internal electric illumination system; and the Titterington Micrometer Compensator which permits compensation to be made with a few turns of a screw driver.

Ask us to send literature illustrating and describing the latest developments in modern Aircraft Instruments. Our line covers all your requirements.

THE FOCKE-WULF KIEBITZ.—A light biplane (70 h.p. Siemens) flown by Herr Kissin.

the Fiats did so well that they were given an order for something like 300 machines by the Italian Government. The story has it that Signor Mussolini has decreed that every officer in the Italian Air Force shall have a light aeroplane of his own, and shall jolly well be made to fly it. That is the right spirit. Senior and junior officers alike ought to be made to fly, if only as an aid to promotion, on the argument that when a man is too slow-witted to fly, and either has to retire or kill himself, he is too slow-witted to hold a command.

The two little Belgian St. Huberts, designed and built by Mr. Guldentops, of the S.A.B.C.A., though hardly what one can call beautiful, are at any rate very workmanlike, and ought to get round the course with great regularity.

The Visitors.

One thing which was particularly striking about the limited audience at Orly was the number of Americans who were there and the scarcity of English people. Apart from Mr. J. J. Ide, who is always everywhere, as befits the representative of the N.A.C.A. for the whole of Europe, one came across Mr. John Hamilton, of the Hamilton Metalplane; Mr. Lester Gardner, now belonging to himself; Messrs. Van Zandt and Manning, of the Ford Company, who had flown over to Le Bourget the day before; Mr. Marvin Northrop, down from a holiday in Scotland after doing a deal with A.D.C. Aircraft, Ltd.; and Mr. Earl Osborn, of *Aviation*, New York; not to mention Mr. Dick who lives at Buc and flies his own Farman monoplane. When all these clever people get back to the States with all the accumulated knowledge of the Tour of Europe to work on, plus all that they saw at Orly of Continental ideas of the design of light aeroplanes, they may possibly start turning out something which at any rate will stop the sale of British designs in America—a line of business which seems to have constituted one of our chief national exports during the past twelve months or so.

The British Empire was represented by Mr. Montague (our Under-Secretary of State for Air), Sir Sefton Brancker (Director of Civil Aviation), Flt.-Lt. J. I. T. Jones, R.A.F. (his pilot), Mr. N. S. Percival (representing Australia unofficially but very effectively), Mr. Jackaman (representing private owners), Capt. Cyril Turner (one can never be quite sure whether he is British or American or French interests), and your humble servant. One does not include in the British list the half-dozen or so very capable British engineers looking after the Armstrong Siddeley Genets and A.D.C. Cirrus and Hermes engines and the Moth aeroplanes. They were there strictly on business, and not merely as on-lookers.

A Lamentable Accident.

The Times of Aug. 6 records a fatal accident to a German competitor, Herr Hoffman, a wing of whose machine broke when he was taking part in the petrol consumption test. There is no pilot named Hoffmann in the competition, so this must refer to Herr Offermann, who was flying the B.F.W. monoplane numbered A.2.

Herr Offermann was one of the most active assistants of the Aero Club of Germany. And one is indebted to him for much kindness during the Aero Show in Berlin last year.

He was by no means a young man, and he had been flying for many years. During the War 1914-18, besides being an active-service pilot, he was a test pilot of various types of Dornier seaplanes, and his knowledge of aircraft was extensive and valuable.

He had great personal charm, and had the typical German qualities of friendliness and hospitality to a high degree. One wishes to offer the deepest sympathy to his friends and his family.

Journalistic Errors.

Certain errors which have been published in the daily papers ought to be corrected. The "Own Correspondent" of *The Times* in Paris, reporting affairs at Orly, says:—

> The best landing times were made by the two British entrants—Broad, 22sec.; Miss Spooner, 30sec. The fastest time was made by the German, Corberry, at a speed of 174 kilometres (about 110 miles) per hour.

Actually, those were the times taken to fold the wings of the two Moths, as related hereinbefore, and "the German Corberry" is in fact John Evans-Freke, Baron Carbery in the Peerage of Ireland, who appears in the programme as a Canadian.

The Daily Telegraph is even less accurate, though not so funny. In the issue of Aug. 3 the aviation correspondent of that paper says:—

> About eighty light aeroplanes, representing a dozen countries, will

THE AERO 34.—A new Czechoslovak light aeroplane (85 h.p. Walter) flown by M. Novak.

to-day set out on a tour over Europe in a competition for the Coupé Challenge, valued at 20,000f. (£166), offered by the French Aero Club. Many subsidiary prizes are offered.

British entrants include the Hon. Lady Bailey, Miss Winifred Spooner, and Captain H. S. Broad, in Moths, and Mr. C. Staniland and another pilot in Spartans.

. . . Two Autogyros will take part in the tour. Germany has thirty-four machines, France twenty-eight, and Brazil, the United States, and Canada are among the countries represented.

This air expert also says that the competitors are expected to reach Paris on Aug. 20.

The truth is that the competitors were not timed to start from Paris till Aug. 7, and the winner is expected back in Paris on Aug. 14.

The "80 light aeroplanes" which he alleges set out on Saturday will probably have been reduced to less than 50 by Wednesday (the day on which this article will be put into print).

The first prize is about £800, and not £166. There are no Autogiros in the Contest. The numbers of machines given for the different nations are all wrong. And the "Coupé Challenge" sounds like a row in a taxi.

Both *The Times* and *The Telegraph* are generally very accurate in their aeronautical news, so one can only imagine that their regular aeronautical correspondents were Bank-holidaying when these mis-statements were written by non-aviating members of these distinguished staffs.

Intrinsic Value.

Taking it all round, the International Challenge Tourism is quite the most important event in aviation sin the outbreak of peace. All the fuss about the Schnei Trophy stirs up a certain amount of interest in high-spe flying, and convinces thousands of people that flying frightfully dangerous. But a tour of this sort round t capitals of Europe brings all sorts of important people all countries into close touch with aeroplanes of sorts of makes and working under ordinary conditions.

If one or two people do happen to be killed in the cou of the competition, their deaths will be put down to ordin transport risks, just like motor accidents, and most pap will probably take no notice of them at all. They will pr ably be dismissed in two or three lines, like our poor fri Offermann. If anybody is killed in the Schneider Cont the papers of the whole world will ring with the news.

The progress of this tour of Europe will be very int esting to watch, and arrangements have been made which The Aeroplane will have notes of that progress fr various stopping places, subject always to the eccentrici of Continental post-offices and railway transport. In case, even if we have to wait a few weeks for the news, official result of the competition will provide much valu information, and will give a wonderful advertisement to makers of the winning machine and engine. All the m pity that we have not a better chance of winning.—C. G

OPEN AND CLOSED.—The Avia BH.11B or Antilopa (85 h.p. Walter) with wings open and folded alongside the fuselage for the gate test. T1 flown by Karel Fritsch, and T2 flown by V. Vlcek.

July 30.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Plt. Off. on probation R. C. Warner is confirmed in rank (Feb. 8). The following Plt. Offs. are promoted to the rank of Flg. Off.:—G. Fox Overbury (June 9), J. A. S. Outhwaite (June 13) (with seniority of June 9), W. R. Hartwright (June 30).

Sq. Ldr. S. N. Cole is placed on the retired list on account of ill-health (July 26). Plt. Off. on probation T. G. Mellor resigns his S.S. comn. (July 7).

MEDICAL BRANCH.—Flt. Lt. E. J. Mockler, M.B., resigns his perm. comn. (July 31).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation:—F. W. Moncreiff (July 12); D. J. L. Bryden (July 16); J. Leigh (July 17); C. H. N. L'Estrange (July 17); R. M. Henning (July 18). W. M. E. Crump is granted a comn. in Class A.A. (ii) as a Plt. Off. (July 17).

V. O. G. Bell is granted a comn. in the Special Reserve as a Plt. Off. on probation (July 1).

The following Plt. Offs. on probation are confirmed in rank:—G. H. Newberry (July 2); F. C. Fisher, F. G. Hill (July 16); G. D. Emms, E. J. B. Langhorne, S. M. Thompson, T. D. Trouncer (July 23); G. G. W. Farquharson (July 24). Flg. Off. E. F. Rhodes is transferred from Class A.A. (ii) to Class C (July 26).

MEDICAL BRANCH.—E. J. Mockler, M.B., is granted a comn. as a Flt. Lt., Class D.i., on resigning his perm. comn. in the R.A.F. (July 31).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 605 (COUNTY OF WARWICK) (BOMBER) SQUADRON.—The following to be Plt. Off.:—J. F. Gummow (June 13).

Appointments.

Week ending Aug. 6.

GENERAL DUTIES BRANCH.—Wing Commanders R. J. Mounsey, O.B.E., to Home Aircraft Depot, Henlow, for Engineer duties, 17/7. J. C. P. Wood, to No. 10 Group H.Q., Lee-on-Solent, for Air Staff duties, 17/7.

Squadron Leaders L. H. Slatter, O.B.E., D.S.C., D.F.C., to No. 19 (Fighter) Squadron, Duxford, 27/7. H. V. Drew, O.B.E., A.F.C., to H.Q., A.D.G.B., Uxbridge, 17/7. B. E. Harrison, A.F.C., to No. 35 Sqdn., Bircham Newton, 10/7. G. H. Boyce, A.F.C., to Air Ministry (C.A.S.), 10/7.

Flight Lieutenants S. D. Macdonald, D.F.C., to No. 605 Sqdn., Castle Bromwich, 1/8. J. H. Butler and R. J. H. Holland, to R.A.F. Depot, Uxbridge, 5/7. H. R. McL. Reid, D.F.C., to Experimental Section, R.A.E., S. Farnborough, 17/7.

Flying Officers J. S. Dewar, to School of Naval Co-operation, Lee-on-Solent, 18/7. C. F. C. Coaker, to Home Aircraft Depot, Henlow, 15/7. C. A. C. Patton, to No. 216 Sqdn., Middle East, 2/7. W. G. Cheshire, to Station H.Q., Heliopolis, 3/7. W. K. Beisiegel, to No. 408 Flight, Donibristle, 34/7.

Pilot Officers J. Cox, to No. 8 Sqdn., Aden, 12/6. R. L. Bennet, to No. 26 (A.C.) Sqdn., Catterick, 18/7. E. C. W. S. Smith, to No. 33 (Bomber) Sqdn., Netheravon, on appointment to a perm. comn. (on probation), 15/7.

MEDICAL BRANCH.—Squadron Leader R. H. Bebb, O.B.E. (Dental), to R.A.F. Depot, Uxbridge, on appointment to a temp. comn., 1/8.

Flight Lieutenants G. H. H. Maxwell, M.B., to H.Q., Coastal Area, 8/8. P. D. Barling, M.B., to R.A.F. Depot, Uxbridge, 18/7. R. A. W. Kerr, M.B., to R.A.F. Depot, Uxbridge, 12/7.

STORES BRANCH.—Flight Lieutenant F. W. Taylor, to R.A.F. Base, Gosport, 19/8.

Flying Officers C. H. W. Boldero, to No. 603 (City of Edinburgh) (B.) Sqdn., 7/8. A. E. Haes, to No. 4 Stores, Depot, Ruislip, 7/8. J. T. Riggs, to No. 25 (F.) Sqdn., Hawkinge, 7/8.

Pilot Officers M. H. Robinson, to Station H.Q., Northolt, 7/8. A. J. Howell, to Station H.Q., Kenley, 7/8. W. J. B. Elliott, to Station H.Q., Worthy Down, 7/8. J. E. V. Tyzack, to Station H.Q., Upavon, 7/8. R. G. Seymour, to No. 2 (A.C.) Sqdn., Manston, 7/8. G. Blinman, to No. 4 Stores Depot, Ruislip, 7/8. H. H. Hilliar, to No. 1 F.T.S., Netheravon, 7/8. R. C. Storrar, to No. 1 School of T.T. (Apprentices), Halton, 7/8.

CHAPLAINS BRANCH.—The Rev. J. R. Appleyard, to Station H.Q., Upavon, 1/8. The Rev. J. H. P. Still, B.A., to School of T.T. (Men), Manston, 6/8. The Rev. R. H. Horton, to H.Q., R.A.F., Cranwell, 8/8.

The R.A.F. in Egypt.

The terms on which the British and Egyptian Governments propose to conclude a Treaty of Alliance were published in London and Cairo on Aug. 7. This Treaty includes the following paragraphs:—

(1) The military occupation of Egypt by the forces of His Britannic Majesty is terminated.

(9) In order to facilitate and secure to His Britannic Majesty the protection of the Suez Canal as an essential means of communication between the different parts of the British Empire, His Majesty the King of Egypt authorises His Britannic Majesty to maintain upon Egyptian territory in localities to be agreed upon, to the east of longitude 32 deg. E., such forces as His Britannic Majesty considers necessary for this purpose. The presence of these forces shall not constitute in any manner an occupation and will in no way prejudice the sovereign rights of Egypt.

A series of explanatory notes from Mr. Henderson (Secretary of State for Foreign Affairs) to the Egyptian Prime Minister includes the following:—

With regard to the British forces referred to in paragraph 9 of the proposals:—

(i) The Egyptian Government will provide, free of cost to His Majesty's Government, lands, barracks, etc., in localities to be agreed upon, equivalent to those now occupied by the British forces in Egypt. Upon the completion of this new accommodation, those forces shall be transferred thereto, handing over the lands, barracks, etc., thus vacated to the Egyptian Government. In view of the technical objections to effecting this transfer piecemeal it shall await the completion of the new accommodation to be provided. Having regard to the character of the region lying to the east of longitude 32 deg. E. steps will be taken to furnish reasonable amenities, by planting trees, gardens, etc., for the troops, who will also be provided with an adequate emergency fresh water supply.

(ii.) Subject to any modifications which may in the future be made by agreement between the two Governments, the privileges and immunities in jurisdictional and fiscal matters at present enjoyed by the British forces in Egypt will continue.

(iii.) Unless the two Governments agree to the contrary, the Egyptian Government will prohibit the passage of aircraft over the territories situated on either side of the Suez Canal and within

ROYAL COMMUNICATIONS.—His Royal Highness the Prince of Wales, K.G. (bareheaded in the foreground), about to enter the Service Wapiti which is maintained at Hendon for his use, to fly to the Scouts' Jamboree at Birkenhead on Aug. 1. His Royal Highness was in no way deterred by the bad weather, indications of which can be seen in the photograph.

Digitized by Google

20 kilom. of it. This prohibition will not, however, apply to the forces of the two Governments or to services maintained by genuinely British or Egyptian organisations operating under the authority of the Egyptian Government.

We also agree that the Egyptian Government will give all necessary facilities to British military aircraft, *personnel* and stores on passage to or from the aerodromes placed at the disposal of the British forces in accordance with paragraph 9 of the proposals. His Majesty's Government will give appropriate facilities to Egyptian military aircraft, *personnel* and stores in territory under their control.

The Royal Air Force Units affected by this Treaty will be:—

The R.A.F. Depot (Middle East), Abukir; the Port Detachment, Alexandria: Headquarters R.A.F. (Middle East), Cairo: Air Ministry Auditor (Middle East), Cairo: Station Headquarters, Heliopolis: No. 216 (Bomber) Squadron, Heliopolis: Headquarters Meteorological Section, Heliopolis: No. 208 (Army Co-operation) Squadron, Heliopolis: No. 45 (Bomber) Squadron, Helwan.

[This arrangement will at any rate cause such a concentration of force along the Canal as to assure our command of the steamship route to India beyond any argument.—Ed.]

The 1928 Operations in 'Iraq.

His Majesty the King has been graciously pleased to approve of the General Service Medal with Clasp "Southern Desert, 'Iraq," being granted, provided the claims are approved by the Air Council, to personnel of the Royal Air Force who took part in the operations against the Akhwan in the Southern Desert, 'Iraq, under the orders of Air Commodore T. C. R. Higgins, C.B., C.M.G., R.A.F., between Jan. 8 and Jan. 22, 1928, both dates inclusive, or Wing Cdr. (now Group Capt.) E. R. C. Nanson, C.B.E., D.S.C., A.F.C., R.A.F., between Jan. 22, 1928, and June 3, 1928, both dates inclusive.

Individuals previously awarded the medal will receive the clasp only.

The grant of the medal and/or clasp will not be made in respect of visits to the sphere of operations by personnel of Air Headquarters, etc., not on the strength of or attached to Akforce, or for service of a temporary nature. This is not, however, intended to exclude special service officers sent out on special missions into the desert.

No claim will be considered unless it is submitted on the form laid down in the appendix to Air Ministry Weekly Order 466.

Claims for serving personnel will be forwarded through C.O.s of units to the Secretary, Air Ministry, Adastral House, Kingsway, London, W.C.2. Officers no longer serving may obtain a copy of the form of application from the Secretary, Air Ministry, and airmen no longer serving, from the Officer i/c Records, Royal Air Force, Ruislip, Middlesex. When completed, the form should be forwarded direct to the Secretary, Air Ministry.

A nominal roll of personnel who were engaged in the operations referred to will be prepared by the A.O.C., 'Iraq Command, and forwarded in triplicate to the Secretary, Air Ministry, for the approval of the Air Council. No action will be taken to issue any medal or clasp until the descriptive particulars of the claimant have been verified and the approval of the Air Council has been given.

The rank entered on the roll will be the highest recorded rank held by an officer or airman while qualifying for the award.

The Air Council reserve the right to disqualify from receiving the medal any person who has been guilty of desertion, or who, by reason of misconduct occurring during the operations for which the award is made, has not, in their opinion, rendered approved service.

[The word Akhwan means simply Brotherhood. It is applied to a somewhat fanatical group of the strict religious sect known as the Wahabi, the head of which is Ibn Saud, Sultan of Nejd and King of the Hejaz, and it includes Arabs of a number of different tribes.—Ed.]

The Henlow Courtmartial.

The Air Ministry announced on Aug. 1 that Flg. Off. Denys Stanley Thomas, who was tried by Courtmartial at Henlow on charges in connection with a crash near Barnet on May 3, has been sentenced to be cashiered and to be imprisoned with hard labour for one year.

The Halton Passing Out.

Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C., Officer Commanding Inland Area, R.A.F., inspected the Aircraft Apprentices of No. 1 School of Technical Training, R.A.F., at Halton on July 30 on the occasion of the passing-out of the September, 1926, Entry.

The Air Officer Commanding Halton, Air Commodore I. M. Bonham-Carter, C.B., O.B.E., in the course of his Report, stated that the Entry now passing out was the fourteenth to complete the Service course of training as Aircraft Apprentices. One special feature of this Entry was the all-round excellence of the top fitters' class and the top carpenter riggers' class. They were exceptional in their attainment and keenness. The top fitters' class especially was distinguished not only in school, but also in the practical training, in sports and games and in general Wing activities.

The fitters (aero engine) had shown a very high standard of skill in basic work and an advance had been made in the general standard of workmanship. Of a total of 88 fitters, 36 had obtained from 80% to 98%, and 114 had obtained from 60% to 80%.

Twenty Aircraft Apprentices of this Entry had been selected for training as fitters (driver, petrol) and the experiment had been tried of reserving all driving instruction until the last two terms of the course. Each class had been allotted a vehicle to overhaul.

The standard of proficiency among the fitters (armourer) had shown an improvement on the last Entry.

A high standard of skill of hand had been attained in basic work among the carpenter riggers of this Entry. The final output had been three complete Gloster Grebe airframes and various partially completed components. The carpenter motor-body builders had received specialist instruction in motor-body building and repairs. During their training they had built a complete Leyland 3-ton body, also the main part of a Crossley tourer car body and a complete rear hood structure for a Morris six-wheel tender. All repairs to station and instructional transport had been done by them.

The Entry was well up to the average high standard of skill in the copper-smiths and sheet-metal workers. Visitors to Halton who themselves had been foremen sheet-metal workers had admitted that the general standard was much above that of the ordinary journeyman.

The standard of drill and discipline had been as good as could be expected under the prevailing conditions. The Apprentices had begun to learn steadiness on parade, march discipline and how to keep their kit and equipment serviceable, marked, and ready for immediate use They had two main difficulties to overcome, first the difficulty

THE PARNALL PETO.—The latest version of the Peto two-seat reconnaissance seaplane with the Armstrong-Siddeley Mongoose engine. This machine is designed to fold for transport inside submarines.

Digitized by Google

of alert behaviour, care of dress and attention to march discipline, and secondly the difficulty of refraining from breaking the rules about smoking.

In games the Entry had done extremely well. In athletics the standard had been good, but in boxing with a few exceptions the Entry had showed more keenness than skill. The success of teams and of individuals had been gratifying, but as regards the best, it could be wished that more instruction was available, and as regards the average and the reluctant, there was not the organisation nor were there the grounds to ensure that all played games.

The health of the Entry had been good and the number of cases of infectious diseases had been particularly low. This might be due to the fact that all milk supplied was Grade "A" Tuberculin tested.

The passing out of this Entry should bring a number of very good tradesmen into productive work if their development during the succeeding two years was carefully fostered and controlled.

Of the 508 who had originally enlisted in this Entry, 60 had been posted to Flowerdown. Sixteen had been discharged as inefficient, 8 by purchase, 4 on medical grounds, and 3 had died and 23 had been transferred to the junior entry.

The results of the final examinations were as follows:—

Leading Aircraftmen 48. Aircraftmen 1st Class 251. Aircraftmen 2nd Class 96. Failed 1. Not examined owing to sickness 5. Total 401.

The following apprentices have been offered Cadetships:—N. C. S. Rutter, S. C. Widdows, J. B. Evans, C. W. Williams.

The following apprentices had been retained for an advanced course with a view to promotion to the rank of Corporal:—C. E. G. Hamblin, R. E. Drake, S. W. Lane E. A. Hollidge, H. G. Hastings, F. C. French, D. W. Munro, E. J. Brandon, J. E. Dutton, J. H. Burgess, J. W. Monk, E. B. Loftus, S. G. Searle, W. N. Wood, H. Holne, J. Sutcliffe, R. P. Rowe, D. W. Scivier.

The following awards had been made:—Grand Aggregate, 560897 AA. Rutter, N. C. S.; Educational Subjects, 560897 AA. Rutter, N. C. S.; Fitters A.E. 1st, 560962 AA. Hamblin, C. E. G.; Fitters A.E. 2nd, 560897 AA. Rutter N. C. S.; Fitter D.P. and Fitter Arm., 560908 AA. Scutt, E. J.; Coppersmith and S.M.W'kr., 560948 AA. Woolfrey, A. R.; Carpenter Rigger and MBB 1st, 560813 AA. Hastings, H. G.; Carpenter Rigger and MBB 2nd, 560525 AA. Burgess, J. H.

The Sir Charles Wakefield Scholarship has been awarded to 560897 AA. Rutter, N. C. S.

Inter-Services Athletics.

The Inter-Services Athletic Championships were held at the R.A.F. Stadium at Uxbridge on July 31. The Army won its seventh consecutive victory with 28 points. The R.A.F. was second with 19 points and the Navy third with 12 points.

The R.A.F. won the Two Mile Relay and the One Mile Team Race.

The results were:—

880 Yards Relay.—ARMY (Sec. Lieut. A. D. Ward, 2nd Bn. Dorset, Sec. Lieut. J. H. Mott, 1st Bn. York and Lancaster, Sec. Lieut. P. D. Powell, 1st Bn. Middlesex, L.-Cpl. C. Richards, 1st Bn. K.O.S.B.), 1; NAVY, 2; R.A.F., 3. Won by a foot; two yards. Time, 1 min. 34 1-10 sec.

Two Miles Relay.—R.A.F. (AC. R. H. Thomas, Henlow AC. Turner, Uxbridge, Cpl. Trim, Martlesham Heath, L-AC. Hester, Uxbridge), 1; ARMY, 2; NAVY, 3. Won easily. Time, 8 min. 18 3-10 sec.

Long Jump.—ARMY (Sjt. Harcourt, 1st Bn. Oxford and Bucks L.I., and Lieut. D. L. Hooton, 1st Bn. York and Lancaster), total 42 ft. 3¼ in., 1; R.A.F., 41 ft. 11¼ in., 2; NAVY, 41 ft. 7¾ in., 3. Best individual jump, Lieut. Hooton 21 ft. 1½ in.

Three Miles Team Race.— ARMY (L.-Cpl. Hester, Cheshire, L.-Cpl. Broadley, 3rd Div. R.C. Signals, Pte. Elwin, 2nd Bn. R. Tank Corps), 1; R.A.F., 2; NAVY, 3. First three men home: L.-Cpl. Broadley, 15 min. 16 3-10 sec., 1; Cpl. Ferris, R.A.F., Uxbridge, 2; Pte. Elwin, 3. Won by 50 yards.

440 Yards Hurdles Relay.—ARMY (Lieut. Lord Burghley, 2nd Bn. Grenadier Gds., Sgt. Foley, 1st Bn. Scots Gds., Lieut. T. C. Boileau, Oxford and Bucks L.I., and Lieut. D. L. Hooton, 1st Bn. York and Lancaster), 1; NAVY, 2; R.A.F. finished third, but were disqualified. Time, 1 min. 4 9-10 sec.

Putting the Weight.—ARMY (Lieut. C. E. Beckwith, Northumberland Fusiliers, and Sjt. Foley, 1st Bn. Scots Gds.), 79 ft. 8¼ in., 1; R.A.F., 2; NAVY, 3. Best Throw: Lieut. Beckwith, 40 ft. 8 in.

One Mile Relay.—ARMY (Lieut. Lord Burghley, 2nd Bn. Grenadier Guards, Pte. Dolan, 1st Bn. K.O.S.B., Lieut. the Hon. C. B. A. Bernard, 1st Bn. Oxfordshire and Bucks L.I., and Bandsman Dunn), 1; R.A.F., 2; NAVY, 3. Time, 3 min. 31 4.5 sec.

One Mile Team Race.—R.A.F., 1; ARMY, 2; NAVY, 3. Order of finish: AC. Thomas, R.A.F., and AC. Turner, R.A.F., equal 1; L.-S. Bloomfield, NAVY, 3. Time, 4 min. 37 7-10 sec.

400 Yards Relay.—ARMY (Sec. Lieut. A. D. Ward, 2nd Dorsets, Sec. Lieut. J. H. Mott, 1st Bn. Yorks and Lancs, Lieut. R. R. Garner, East Yorks, and Lieut. Beamiss, R. Tank Corps), 1; R.A.F., 2; NAVY, 3. Won by inches. Time, 39 7-10 sec.

High Jump.—ARMY (Lieut. H. R. Norman, 2nd Bn. Coldstream Gds., and Lieut. T. P. Saunders, Queen's Own Cameron Highlanders), 11 ft., 1; R.A.F., 2; NAVY, 3. Best Jumps: Lieut. Norman and Flg. Off. Nuttall (R.A.F.), 5 ft. 7 in.

The R.A.F. Lawn Tennis Championships.

The R.A.F. Lawn Tennis Championships were held at Queen's Club on July 29, 30, 31 and Aug. 1 and 2. Wing Cdr. H. J. F. Hunter beat Wing Cdr. R. E. Saul (holder) in the final of the Singles, and Wing Cdr. Hunter and Wing Cdr. Saul beat Flt. Lt. Davies and Flt. Lt. Williamson-Jones in the final of the Doubles.

The details were:—

R.A.F. SINGLES CHAMPIONSHIP.

First Round.—Flg. Off. J. W. Busteed beat Grp. Capt. E. G. Fowler (2—6, 6—4, 6—4); Sq. Ldr. C. St. Noble beat Wing Cdr. J. C. P. Wood (6—3, 6—1); Flt. Lt. E. D. H. Davies beat Cpl. C. G. Payne (6—1, 6—2); Flg. Off. A. H. E. Frost beat F-S. H. C. Witts (7—5, 4—6, 6—1); Flt. Lt. C. Williamson-Jones beat Plt. Off. H. E. Sales (6—3, 6—4); Flt. Lt. H. G. White beat Flg. Off. F. G. Downing (6—3, 6—4); Sq. Ldr. N. F. D. Buckridge beat Air Comdre. A. D. Warrington-Morris (9—7, 6—4); Wing Cdr. R. E. Saul (holder) beat Flt. Lt. J. Duminy (6—1, 6—4); Sq. Ldr. T. C. Thomson beat L-AC. Muir, W. B. (6—4, 9—11, 6—0).

Second Round.—Wing Cdr. H. J. F. Hunter beat Busteed (6—0, 6—0); Davies beat Flg. Off. L. V. Hirst (7—5, 6—0); Williamson-Jones beat Flg. T. C. Reep (6—1).

Flg. Off. R. E. Hall beat Flt. Lt. H. J. Gilbert (2—6, 6—3, 6—3); Hall beat Sq. Ldr. C. St. Noble (6—1, 7—5); Sq. Ldr. N. F. D. Buckeridge beat Flt. Lt. H. G. White (6—4, 6—1); Wing Cdr. R. E. Saul (holder), w.o., Wing Cdr. L. T. N. Gould scratched; Sq. Ldr. F. G. M. Williams beat Sq. Ldr. T. C. Thomson (6—3, 6—4); Flg. Off. A. H. E. Frost beat Grp. Capt. H. R. Nicholl (6—1, 6—2).

Third Round.—Wing Cdr. H. J. F. Hunter beat Flg. Off. R. E. Hall (8—6, 7—5); Flt. Lt. E. D. H. Davies beat Flg. Off. A. H. E. Frost (6—2, 6—1); Flt. Lt. C. Williamson-Jones beat Sq. Ldr. N. F. D. Buckeridge (6—1, 3—6, 6—3); Wing Cdr. R. E. Saul (holder) beat Sq. Ldr. F. G. M. Williams (6—0, 6—3).

Semi-final Round.—Wing Cdr. H. J. F. Hunter beat Flt. Lt. E. D. H. Davies (6—1, 6—1).

Wing Cdr. R. E. Saul (holder) beat Flt. Lt. C. J. Williamson-Jones (6—2, 6—4).

Final Round.—Wing Cdr. H. J. F. Hunter beat Wing Cdr. R. E. Saul (holder) (6—3, 4—6, 4—6, 6—2, 6—3).

R.A.F. DOUBLES CHAMPIONSHIP.

First Round.—Flt. Lt. H. J. Gilbert and Flt. Lt. J. Duminy beat Plt. Off. H. E. Sales and Flg. Off. R. E. Hall (6—3, 5—7, 6—4); Flt. Lt. E. D. H. Davies and Flt. Lt. C. J. Williamson-Jones beat Sq. Ldr. C. St. Noble and Sq. Ldr. N. F. D. Buckeridge (6—8, 6—3, 6—4); Air Comdre. A. D. Warrington-Morris and Wing Cdr. A. G. M. Belfield beat Flg. Off. J. R. Ackers and Wing Cdr. J. C. Wood (6—1, 6—1).

Second Round.—Wing Cdr. R. E. Saul and Wing Cdr. H. J. F. Hunter beat Flg. Off. F. G. Downing and Wing Cdr. F. L. Robinson (6—3, 8—6); Air Comdre. A. D. Warrington Morris and Wing Cdr. A. G. M. Belfield beat Grp. Capt. H. R. Nicholl and Air Comdre. F. W. Bowhill (6—3, 6—0); Flg. Off. L. V. Hirst and Flt. Lt. H. G. White beat Flg. Off. J. W. Busteed and Sq. Ldr. C. T. Thomson (6—2, 6—2); Flt. Lt. E. D. H. Davies and Flt. Lt. C. J. Williamson-Jones beat Flt. Lt. H. J. Gilbert and Flt. Lt. J. Duminy (7—5, 6—2).

Semi-final Round.—Wing Cdr. R. E. Saul and Wing Cdr. H. J. F. Hunter beat Air Comdre. A. D. Warrington-Morris and Wing Cdr. A. G. M. Belfield (6—0, 6—2).

Flt. Lt. E. D. H. Davies and Flt. Lt. C. J. Williamson-Jones beat Flg. Off. L. V. Hirst and Flt. Lt. H. G. White (6—3, 6—4).

Final Round.—Wing Cdr. R. E. Saul and Wing Cdr. H. J. F. Hunter beat Flt. Lt. E. D. H. Davies and Flt. Lt. C. J. Williamson-Jones (6—1, 6—4 6—3).

R.A.F. INTER-STATION DOUBLES.

Semi-final Round.—Grp. Capt. G. V. Fowler and Flt. Lt. C. J. Williamson-Jones (Henlow) beat Wing Cdr. H. J. F. Hunter and Wing Cdr. L. T. N. Gould (7—5, 4—6, 6—4); Flg. Off. L. V. Hirst and Flt. Lt. E. D. H. Davies (Halton) (holders) beat Sq. Ldr. C. St. Noble and Flg. Off. A. H. E. Frost (6—4, 7—5).

Final Round.—Flg. Off. L. V. Hirst and Flt. Lt. E. D. H. Davies (Halton) (holders) beat Grp. Capt. G. V. Fowler and Flt. Lt. C. J. Williamson-Jones (Henlow) (9—7, 3—6, 7—5, 6—4).

R.A.F. VETERANS' CHALLENGE CUP.

Final Round.—Wing Cdr. F. L. Robinson (rec. 2/6) beat Sq. Ldr. F. G. M. Williams (scratch) (4—6, 7—5, 6—4).

R.A.F. PLATE SINGLES.

Semi-final Round.—Flt. Lt. H. G. White beat Flg. Off. J. W. Busteed (6—2, 6—2); Sq. Ldr. C. St. Noble beat Wing Cdr. L. T. N. Gould (8—10, 6—2, 6—2).

Final Round.—Noble beat White (6—3, 2—6, 6—4).

NEW OFFICIAL PUBLICATIONS.

The following important new publications have recently been issued by His Majesty's Stationery Office. Copies may be had from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, E.C.4, at the published price plus postage.

Regulations for the Royal Air Force, 1928:—This includes the King's Regulations and Air Council Instructions for the Royal Air Force with appendices and index embodying regulations and orders issued up to November 22, 1928, in one volume, price 7s. 6d.

R.A.F. Drill and Ceremonial (Provisional):—Full particulars of non-technical training, individual and collective training, ceremonial drill, complements in boats, etc., fully illustrated with photographs and diagrams. 2s. 6d.

Dress Regulations for Officers of the Royal Air Force:—This volume is about the size of a copy of THE AEROPLANE and has a stiff cover with gilt lettering. It is overpoweringly illustrated with headless bodies in uniform. Such interesting information as the order that cummerbunds will be worn with tropical mess kit on and after Jan. 1, 1930, up till which date waistcoats are optional, will fill many an idle moment with instruction and entertainment for the owner of this delightful book. 4s. 6d.

Royal Air Force Pocket Book:—A new edition of this invaluable publication without which no ardent aviator can tie a hitch knot, quarter a dead sheep, level an aerodrome, or construct an adequate grease trap. 3s.

Digitized by Google

THE SCHNEIDER TROPHY CONTEST.

The Italian Schneider Team will probably arrive in England very shortly. It will comprise in all eleven high-speed seaplanes, and in addition to the actual high-speed team of pilots, there will be twenty officers and a large number of mechanics.

Rumour has it that at least two of the Italian seaplanes will have two 1,000 h.p. engines mounted in tandem, with the pilot situated between them. This arrangement is similar to that proposed by Dr. Claud Dornier. A model of a proposed Dornier racing seaplane of this type was exhibited at Olympia a few weeks ago, and in Berlin last year. The Fiat and the Savoia and the Macchi firms are known to have produced racing seaplanes for the contest. Both Fiat and Isotta-Fraschini have built special racing engines, which are rumoured to give anything from 1,000 to 1,600 h.p.

Little news is available about the French contestants except that the machines are built and ready for the engines. The engines are built and one of each type has been fitted to the aircraft for installation purposes. Contrary to previous reports, the Hispano-Suiza engines are not of the inverted "T" type, but of a flattened inverted broad arrow type, the angle between the cylinder blocks being 85 degrees.

Contrary to all published reports, the team will consist of young pilots of the French Naval Air Service, and will not include veteran pilots such as MM. Sadi-Lacointe, Lasne, and Bonnet, who have had no experience of modern speeds and are regarded as being too old to have nerve reactions quick enough for such work.

The French are not optimistic about their chances. They believe in their motors and their aeroplanes, but are doubtful about their floats. But at any rate they hope to escape with an honourable defeat, and not to appear ridiculous by being completely out-classed. [When a competitor talks in that way, you may regard him as being dangerous.—C. G. G.]

The American "team"—consisting of Lieut. A. L. Williams, U.S.N., has taken his Kirkham-designed machine to the U.S. Air Station at Annapolis, where he proposes to test it.

The rumour that Col. Charles Lindbergh is to be the spare pilot, or that he offered to act as such, is obviously pure newspaper bunk.

The British contestants are ready, but none of the machines had flown up to Aug. 1. A "private view" is to be given to the Press on Aug. 12, at Calshot.

A DAY TRIP TO THE "ORFORD."

The Royal Aero Club has made arrangements whereby a limited number of Day Tickets will be issued to Members of the Royal Aero Club and Associated Light Aeroplane Clubs to witness the Contest for the Schneider Trophy, to be held on Saturday, September 7, 1929, from the s.s. *Orford*, which will be berthed at the starting line off Ryde Pier.

Members may apply for not more than two extra tickets for Guests.

The price of the Day Tickets is £2 2s. each, which covers transport by the Club Tender from Southampton to the s.s. *Orford* and return to Southampton.

Buffet Luncheons and Teas will be available on the s.s. *Orford* at reasonable prices.

TRANSPORT ARRANGEMENTS.

A special train for the Members will leave Waterloo on Saturday morning, September 7, at 7.5 a.m., arriving at Southampton (Town Terminus) at 8.50 a.m.

The Official Tender of the Club, *The Duchess of Cornwall*, will leave the Royal Pier, Southampton, at 9.45 a.m. sharp, for the s.s. *Orford*, and will return from the s.s. *Orford* to Southampton not later than 6.30 p.m.

The special train for the Members for the return journey to town will leave Southampton at 8.55 p.m.

To avoid confusion at Waterloo, the Club has arranged with the Southern Railway for tickets to be available to Members in advance, and these can be had at the Club, 3, Clifford Street, W.1. No class of carriage can be guaranteed. Return Tickets from Waterloo to Southampton, 22s.

All applications for Tickets for the s.s. *Orford* and Railway Tickets must be accompanied by a remittance covering the cost of tickets required.

Applications will be dealt with strictly in rotation of recept. *Early application is requested.*

ANCHORAGES AND INSTRUCTIONS FOR SMALL VESSELS.

The following has been issued by the Royal Aero Club, on behalf of the King's Harbour-Master, Portsmouth:—

1. Small craft drawing less than 8 feet of water may anchor in any of the following areas which have been reserved for them:—

Bramble, Browndown, Hayling, Horse Sand, Mother Bank, Wootton, and West Ryde Middle to the East of West Ryde Middle Light Buoy.

The details of these areas are shown on a published chart which can be obtained from the Secretary, the Royal Aero Club, 3, Clifford Street, London, W.1, the prices of which are eight shillings and sixpence for one of large size and two shillings for a smaller scale chart, post free.

2. All vessels, including rowing and sailing boats, must be at anchor in one of these areas not later than 1 p.m. (British Summer Time) on the day of the race and must remain anchored until the race is completed,—or postponed.

It will be greatly appreciated if the public will carry out promptly any instructions given by the Patrol Boats which will each have a Naval Officer on board and will be flying a yellow flag in the bow.

The only vessels, other than patrol boats, allowed to be under way after 1 p.m. (British Summer Time) are a small number of official and first-aid boats.

3. British Men-of-War and Shore Signal Stations in the vicinity of Spithead and the Solent will fly a large Red flag from 10 a.m. (British Summer Time) until such time as the race is completed, or postponed, when this flag will be changed to a large Blue flag. Spectators who are unable to receive the W/T broadcast transmissions concerning the race will therefore have this means of ascertaining when the race is completed,—or postponed.

4. All ships and vessels in the vicinity of the Isle of Wight are requested to cease all W/T transmission, as far as possible, from Noon (British Summer Time) until the completion of the race.

5. Owing to Seaplane Reliability Trials taking place the previous day, no vessel is to take up a position in the Bramble, Browndown, or Wootton areas until the morning of the day of the Race itself.

6. It should be definitely understood that the presence of any vessel in any position other than the authorised anchorages as shown on the chart, whilst the race is in progress, is likely seriously to endanger its safety and that of the competing seaplanes.

7. It would be much appreciated if all vessels which are able to do so would dress ship overall during the Race.

8. In the event of postponement, these instructions will be in force for the day on which the Race takes place.

THE SCHNEIDER TROPHY CONTEST FUND.

In response to a recent appeal made by the Royal Aero Club, the following donations have so far been received:—

	£	s.	d.
Sir Charles C. Wakefield, Bart.	5000	0	0
The Hon. A. E. Guinness..	250	0	0
The Southern Railway Company	105	0	0
Mr. H. Gordon Selfridge	52	10	0
Cellon (Richmond) Ltd., Mr. A. K. Macomber, and Col. B. S. Millard (each)	50	0	0
The Hon. Henry Mond and Mr. F. G. T. Dawson (each)	20	0	0
Lairdways	15	0	0
Mr. E. Owers	10	10	0
Mr. C. Oswald Liddell	10	0	0
Lieut.-Col. Sir John Humphery, Mr. J. J. Morgan, Mr. William Leuchars, Mr. Stanley Spooner, Sq. Ldr. A. Kubita and Sir Charles Allom (each)	5	5	0
Sir John C. E. Shelley Rolls, Bart.	3	0	0
Mr. John E. Humphery, Mr. H. J. Preston and Mr. C. W. Berry (each)	2	2	0
Mr. C. Gray Hill, Mr. F. Bellamy, Mr. A. J. Ellis and Miss W. L. Lockyer (each) ..	1	1	0
Mr. E. Newgass		10	0

Subscriptions should be sent to the Royal Aero Club, 3, Clifford Street, London, W.1.

[Sir Charles Allom, once the proprietor of the Gosport Aviation Co., which made some of our finest flying boats, is to be congratulated on thus showing a renewed interest in Aviation. At this rate the Royal Aero Club may easily expect the odd guinea or so from Lord Waring, who is generally regarded as having acquired his peerage in connection with aviation, and others of the nobility and gentry created during the War 1914-18, who have unhappily severed their connection with flying since then.—C. G. G.]

LIEUTENANT BONNET.

The Times of Aug. 7 reports the death on Aug. 6 of Lieut. Bonnet, who was killed in a crash at Hourtin, near Bordeaux. As Adjudant Bonnet this officer was known as one of the finest French fighting pilots during the War and as one of the best speed pilots afterwards. In 1924 he put the World's Speed Record up to 448.171 km.p.h. (277.805 m.p.h.), on a Bernard-Hubert monoplane,—which speed is still the highest ever attained by an aeroplane on wheels, though it has been beaten by a number of Schneider Trophy speed machines.

The report of Lieut. Bonnet's death states that he had been designated by the Air Ministry to be one of the French team in the Schneider Trophy Contest. This statement has been denied to the writer personally by an officer of the French Air Ministry, who has stated that the French pilots for the Schneider Trophy Contest will be young officers of the Navy. Nevertheless there is still a possibility that Lieut. Bonnet may have been testing one of the French Schneider machines at the time of his death.

Lieut. Bonnet was well beloved by all who served with him. He did great service to French Aviation, not only by his many great flights, but also by his unusual skill and reliability as a test pilot. One offers to French Aviation deep sympathy in the loss of one of its most brilliant sons.—C. G. G.

THE INDIA-AND-BACK RECORD.

At [illegible] on Aug. 2 the Fokker FVII monoplane, *The [illegible]* (Bristol Jupiter geared engine), [illegible] with Mr. R. F. Little as [illegible] Bruce the Duchess of Bedford as passenger [illegible] in an attempt to fly to India and back in [illegible].

At [illegible] on Aug. 5 the machine landed at Karachi. The journey from Lympne was made in four stages, with [illegible] at [illegible] Aleppo and Bushire, and the total flying time was [illegible].

At [illegible] on Aug. 6 the return journey was begun.

We may now look forward to a regular series of attempts on the India-and-back Record. These should be encouraged, [illegible] they will help to show up the ridiculous inadequacy of the present so-called Indian Air Mail Service, which [illegible] by train sleeps every night, and never exceeds [illegible].

An adequate air-mail service,—such as would be perfectly possible to-day at no more cost than the present service—would average 150 m.p.h. day and night, and would cover the whole distance in 36 hours, or thereabouts.

THE "GRAF ZEPPELIN."

At 12.30 hours, on Aug. 1, the *Graf Zeppelin*, commanded by Dr. Eckener, left Friedrichshafen for America with nineteen passengers, a general cargo weighing approximately two tons, about 7 cwt. of mails, and a crew of forty-two.

The previous attempt in May to fly to New York was abandoned, as the ship had to turn back when over Spain with three of her four engines out of action.

During the time she has been in dock the engines have been fitted with new couplings and various other improvements have been made. The trouble was that the old type of coupling fitted between the motors and the airscrews set up syntonic vibrations, which broke the crankshafts.

Newspaper reports say that among the passengers were Sir Hubert Wilkins, Miss Anna May Wong, and "Susu," the gorilla. The general cargo included a Rubens picture, a Bechstein grand piano, 600 canaries, and a bust of the late Baron von Hünefeld. The juxtaposition is interesting, and somewhat apposite.

Finally, there was the inevitable stowaway, a baker's apprentice from Düsseldorf, who introduced himself into the ship by the simple expedient of falling off the roof of the shed and bursting his way through the envelope. This yarn seems unbelievable. The doped fabric outside an airship would stand much more than the impact of a human body dropping a few feet. Possibly the truth is that the man dropped onto the top of the ship and crawled down the chimney which leads down between the gas-bags.

The *Graf Zeppelin* proceeded over Basle, Lyons, Perpignan, Barcelona, Gibraltar, to the Azores, actually leaving the European mainland at Cadiz, Spain, at 05.50 hours on Aug. 2. Soon after passing the Azores the *Graf Zeppelin* established wireless communication with the United States.

At 16.00 hours (21.00 hours B.S.T.) on Aug. 4 it was sighted over Cape May, New Jersey. At 19.29 hours the *Graf Zeppelin* arrived over Lakehurst, but did not come down until nearly 22.00 hours. The actual crossing from Friedrichshafen to Lakehurst took 93 hours, which is only some 18 hours less than the record-breaking crossing of the new German liner *Bremen*.

From Gibraltar to the north of Bermuda the weather was good, but beyond that there were head winds and rain.

Dr. Leisler Keipman, manager of the Hamburg-Amerika Line, who was a passenger on the ship, said that his company had decided to put its organisation behind the project of building airships.

According to another authority, four new Zeppelin airships twice the size of the *Graf Zeppelin* are to be built, and it is hoped to have them by the Spring of 1931.

A new airship base is to be established at Richmond, Va., which is clear of fog such as is found at Lakehurst.

President von Hindenburg telegraphed his "heartiest congratulations" to Dr. Eckener on the successful conclusion of the second Atlantic flight of the Graf Zeppelin, the arrival of which at Lakehurst in the early hours of Aug. 5, by European time, was described to German listeners by a relayed broadcast.

Lord Thomson, Secretary of State for Air, has sent the following message to Dr. Eckener:—"Air Council tender warm congratulations on your fine achievement and successful voyage to United States."

THE WINGS OF THE SOVIET.

On July 30 there arrived at Croydon the three-engined A.N.T.-9 monoplane, *Wings of the Soviet*.

A photograph of this machine, taken at the aerodrome near Rome, appeared in THE AEROPLANE, p. 312, of July 31.

It was piloted by M. Gromoff and carried ten passengers, among whom were M. Zarzar, the Chief of the Red Civil Air Fleet, representatives of the Dobrolot and Osaviachim civil air transport organisations, M. Archangelsky (one of the designers of the machine, who was acting as engineer-mechanic), and five journalists. Among the journalists was M. Effimoff, one of Soviet Russia's leading caricaturists, who, alone, as the result of his art, has been responsible for the exchange of five international notes of protest.

The machine is making a tour of the capitals of Europe and before reaching London it had flown from Moscow to Berlin non-stop in 10 hrs., from Berlin to Paris and from Paris to Rome. An attempt was made to fly non-stop from Rome to London, but what the French would call *une petite avarie* forced the machine to land at Nevers. After the trouble was remedied the flight was continued direct to London, where it arrived at 18.00 hrs. on July 30.

The A.N.T.-9 is the first of a series of three-engined commercial monoplanes built at the Central Aero-Hydrodynamic Institute, Moscow, to the designs of M. A. N. Toupoleff.

M. Toupoleff has been responsible for the production of several original all-metal aircraft, the best known of which is the A.N.T.-3, a two-seat high-performance postal or reconnaissance biplane originally fitted with a Napier Lion engine, and later with a Russian-built Liberty engine. This machine, piloted by M. Gromoff, flew a circuit of Europe of over 4,000 miles in 34 hrs.' flying time and later flew from Moscow to Tokyo. It was exhibited at the Berlin Aero Show last year.

The A.N.T.-9, or *Wings of the Soviet*, is a high-wing cantilever monoplane and has three Gnôme-Rhône Titan engines, one in the nose and one in the leading-edge of each wing-root, close up to the fuselage.

It is built almost throughout of an aluminium alloy known as Koltchougalumin, which has been developed by the Koltchougino Works. This metal in its hardened state has a tensile strength of 40 kgs. per sq. mm., or roughly 25 tons to the sq. in., with an elongation of 20 per cent. Its specific gravity is 2.85.

THE SPANISH MISSION AT SOUTHAMPTON.—Left to right: Gomez Spencer, Juan Montis, Antonio Numez, Pablo Hermide, Major Jullerot (of Vickers Ltd.), Admiral Juan Cervera, Air Commodore J. A. Chamier (of Vickers Ltd.), Manuel De Florez, J. Oster Echagué, J. Pastor, I. Fuster, Mr. C. R. Gray (of the Supermarine division of Vickers Ltd.).

ON THE TURN:—A striking view of the Hawker Hart two-seat Fleet Reconnaissance Fighter [Rolls-Royce "F" engine] turning in front of the main sheds at Brooklands.—(*"Aeroplane" photograph.*)

Digitized by Google

The external covering is of corrugated koltchougalumin, which gives the illusion that the machine is of Junkers construction. Actually this is not the case, the internal construction being quite original.

The engine mountings are welded steel tube structures and the wing engines are faired very neatly into the wings. The nacelle cowling appears to be bolted on and does not give the impression of accessibility. The fuel tanks are in the wings, the feed to the engines being by pump. A compressed-air starting system as well as magnetos are installed.

The pilots' cockpit is in front of the leading-edge of the wing and seats two side-by-side. Control is by the usual wheel with self-aligning pedals for the rudder. The control system is almost entirely internal. The rudder control is by cable and the elevators and ailerons by push-and-pull rods.

The cabin is large and roomy and seats nine passengers in ordinary cane chairs, which, however, are more comfortable than is usual with this type. A lavatory is situated immediately abaft the cabin, and alongside it is an emergency exit through the roof of the cabin with a short ladder leading up to it. Aft of this is a baggage compartment which has a separate door on the right side of the fuselage.

The undercarriage is of the divided type and each unit consists of a long telescopic leg with rubber-in-compression springing anchored to the wing underneath the wing engine. The bottom end of the leg is hinged to the bottom longeron of the fuselage by welded steel tube axle and radius-rod.

The tail unit is of the monoplane type. The surfaces are built up in a manner similar to the wings. All control surfaces are balanced.

The material used in the construction of the A.N.T.-9 is entirely Russian, even to the wheels and tyres.

A series of this type is now being built for use on a new line to be operated between Moscow and Vladivostok.

Before starting on its European tour the *Wings of the Soviet* has made a large number of domestic propaganda flights, including one non-stop flight from Moscow to Odessa.

In addition to carrying a complement of eleven on three Titan engines the machine has fuel for ten hours.

Its principal dimensions are:—Span 23.73 m. (77 ft. 10 in.), Length 16.8 m. (55 ft. 1 in.), Height 5 m. (16 ft. 5 in.). Its loaded weight is 4,750 kgs. (10,480 lbs.) and it carries a useful load of 1,690 kgs. (3,730 lbs.). The maximum speed is 210 km.p.h. (130 m.p.h.).

On its non-stop flight from Moscow to Berlin, carrying an overload in bad weather, it averaged 186 km.p.h. (116 m.p.h.) for 10 hours.

It left Croydon on Aug. 4 to return to Moscow by way of Berlin and Warsaw.

THE BUSK STUDENTSHIP IN AERONAUTICS.

The trustees of the Busk Studentship in Aeronautics, founded at Cambridge University in memory of Edward Teshmaker Busk, who lost his life in 1914 while flying an experimental aeroplane, have awarded the studentship for the year 1929-30 to Mr. Stanley George Hooker, B.Sc., A.R.C.S., of the Royal College of Science, London.

DISTINGUISHED VISITORS.—Left to right: Mr. Phya Prakit, Director-General of Posts, Siam; H.R.H. Prince Pura Chatra; and Mr. Chao Kavila, Engineer and Pilot of Siam, on a visit to the Supermarine Works of Vickers (Aviation) Ltd. at Southampton.

THE MOVING SPIRIT.—Mr. Hewlett of the Anglo-American Co. at Croydon sees that "The Southern Cross" gets the right stuff before starting for Holland.

ON AND ON AND ON.

On July 30 at 19.38 hrs. Mr. Dale Jackson and Mr. Forest O'Brien landed at St. Louis in their Curtiss-Robertson Robin monoplane (Curtiss Challenger engine) after having remained in the air for 420 hrs. 21½ mins.—or roughly 18 days and nights.

They beat the previous re-fuelling duration record by 173 hrs. 38 mins., and the reason for their descent was a peremptory order from their sponsors to do so. The sponsors had promised them a certain sum of money for every hour they flew over the previous record, and apparently it was feared that they might go on for ever. Actually they earned $17,000 (£3,400) in this way in addition to 18 days' wages.

A suggestion has been made that in future a platform on a high scaffolding shall be erected where the machine and pilots may retire into oblivion as long as they like without the need for running their engine or wasting petrol.

THE SPEED CRAZE.

According to *The Times* a special badge has been introduced in the Italian *Regia Aeronautica* for pilots of high-speed aircraft. It takes the form of a small V-shaped design in red enamel and will be conferred on military pilots who, when flying in machines capable of reaching a horizontal speed of more than 500 k.p.h. (about 312 m.p.h.), effectively attain that speed in a properly controlled test.

THE JUNKERS HEAVY-OIL ENGINE.

Further experimental flying has been made at Dessau with the Junkers compression-ignition engine, in a Junkers G-24 monoplane. The engine is stated to have given 850 h.p. at 1,300 r.p.m., and the fuel consumption is given as about 25 per cent. less per h.p./km. than that of a petrol engine of similar output.

A total of fifteen hours' flying was made in the latest tests. One flight was of eight hours' duration.

AN ERRAND OF MERCY.

On Aug. 1, Flt. Lt. Higgins, R.C.A.F., made a flight of 1,200 miles between dawn and dusk to succour an Indian boy who was lying badly injured on the shores of James Bay, at the southern extremity of Hudson's Bay.

EDUCATION AND EDIFICATION.

In The Aeroplane office, left over from the Aero Show, are a number of copies of notable foreign periodicals, including the Special Number of *Luftwacht*, in which particularly interesting special articles are published in German and English, and the important French fortnightly publication *L'Air*, also specially published for our Aero Show. A parcel containing copies of both these papers, together with one or two other foreign publications, will be posted to any applicant on receipt of 6d. in stamps for cover postage.

This offer is being made because intelligent people in this country ought to have the chance of becoming better acquainted with our Continental contemporaries.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE SCARBOROUGH AIR PAGEANT.

Scarborough was treated to an ably-managed little Air Meeting on Bank Holiday Monday.

The Berkshire Aviation Tours have had some Avros at the flying ground—the old racecourse—for some few days, and they have been doing quite a good trade with passenger flights. On Monday the weather started badly with showers, but it cleared up fairly early and turned out quite cheerful.

A prelude to the day's Pageant was a formation of light aircraft which flew round the town and neighbouring country on Sunday evening. More and more private owners are painting their machines in gay colours, and on Sunday evening these machines vied with the colours to be seen on the beach, over which they flew.

Just before lunch on Monday Mr. Clarke flew the new Junkers F.13 over with Mr. Trost. They left again in the evening for Dublin—how we do get about these days!

The Rally to Scarborough was won by Mr. Ivor Thompson on a Yorkshire Club Bluebird. After his success he was made to pay for it by going up and giving an exhibition. Mr. Thompson is a club-trained pilot, with, as far as one could understand, no previous flying experience, but his display was quite one of the best and neatest shows one has seen. His bunts, rolls, and so on, were beautifully done, considering the power-to-weight ratio of the Bluebird.

Mr. R. G. Cazalet was the second in the Rally, with Mr. Dawson, on a Bluebird, third, and Miss Winifred Brown, on her Avian, fourth. Miss Brown also got the prize for the first lady pilot to arrive.

Mr. Kingwill gave a very pretty display on the Northern Air Lines Moth before the Scarborough Open Handicap.

This was over a two-lap course of about 25 miles and in view of the spectators all the time.

Miss Brown won after a good race, having started second. Flt. Lt. Rose, on a Moth, was second by a short airscrew-boss, with Mr. Lacayo, on an Avian, third.

Mr. Cazalet, on his Widgeon, seemed to get the usual terrific handicap that the Widgeon is always given, and consequently retained his position in the race, though he flew a beautiful course.

Flt. Lt. Rose gave another show to enliven the crowd—which, by the way, was quite numerous by now. And then Mr. Lawson did some inverted flying on an Avro.

Balloon bursting was the next thing on the programme. Only two pilots entered, Mr. Lacayo, on an Avian, and Flt. Lt. Rose on a Moth.

The Moth must have thought the balloons were candles, for it flew straight into most of them and effectively extinguished them.

The bombing event, now so customary, was varied by the dejected suitor in a Moth as the bomber, and the bride and bridegroom escaping in a car as the bombed.

No direct hits were scored, but the car was finally enveloped in smoke, which made the occupants continue their "great adventure" on foot—an attempt to carry the bride failing dismally and showing the decadence of the modern he-man.

Several more interesting events were billed, including Mr. Tranum in one of his well-known parachute drops, some crazy flying, and a finale in the shape of a flight at dusk by an illuminated Avian, but one was unable to wait for these, as one had to catch the post.

THE LEICESTER AERO CLUB INAUGURATION.

The Leicester Aero Club held their inaugural luncheon at the Granby Halls on July 31.

The club is the outcome of the far-sightedness of the Leicester Chamber of Commerce, and was really started in February. At that time the Commercial Aviation Committee of the Chamber of Commerce came to the conclusion that, in view of the fact that the proceedings for the establishment of a Municipal Aerodrome were likely to be protracted, their best line would be to sponsor the formation of a flying club so that those who mattered would thereby become more airminded and finally assist the whole matter instead of, as up to the present, rather obstructing it.

The Municipal Aerodrome is still "in the wind" and should become a reality before very long, but at the same time Leicester will have gained the advantages of having a flying club, and, being composed of business men whose idea of flying is to use it for their business, the club should benefit by having an income from taxi-work and special charter jobs. One was a trifle surprised to hear the sporting and social side of the club relegated to the back seat in such a county as Leicester—they are even calling their Moth "the Quorn"! But throughout the speeches, and especially that of the President, the whole theme was business and utility.

Not wishing to overlap any arrangements which might be under way, the Aviation Committee came to London and interviewed the Directors of National Flying Services Ltd. before actually starting on the club. But again finding that nothing might be done for a very long time they decided to go ahead and the club was duly formed. Mr. W. Lindsay Everard, M.P., consented to become their first President and generously got several of his business friends together and defrayed the cost of the first machine,—which is the first Moth of the all-metal production series.

An aerodrome has been found about seven miles away from the city at the corner of the Desford and Peckleton lanes. It has been to a certain extent equipped, and should prove quite satisfactory as the surface is level. It was at one time used by the R.A.F. But seven miles out from a comparatively small city, such as Leicester is in area though not in importance, is much too far for a municipal aerodrome.

The Moth was in the large hall adjoining the dining-room and gave a fit setting to the lunch. This entertainment gave further evidence of the generosity of the Club's President, as the whole cost was defrayed by him. About 150 guests were present, and in spite of the aforementioned business attitude all seemed to enjoy themselves thoroughly. The Club is to be congratulated on having such a hard-working and efficient Secretary, for his efforts went far to make this first function a great success.

After the toast of The King, the Chairman and President of the Club, Mr. W. Lindsay Everard, M.P., proposed the toast "Our Guest," the Rt. Hon. Brig.-Gen. Lord Thomson, Secretary of State for Air.

MR. EVERARD said that he knew nothing about flying and had no use for it except as a means of getting about one's business in the fastest manner possible. As a sport he was not interested in it, but for business he was all for it and that was the reason for this Club's formation.

Now that this new form of transportation had come to stay he, for

A NEW FRENCH LIGHT AEROPLANE.—The Farman 200 monoplane (120 h.p. Salmson engine), which sells for approximately £770. This machine was present at the opening of the Orly Meeting.

one, was not going to see Leicester behind other counties. The foresight of the ancient City fathers had ensured for them the second railway in the country—the Westbridge line—and so had set them an example which they must live up to.

Leicestershire was already rather behind some other counties in that they had let the chance of a subsidy go by, but now having started they must catch up and pass them. They had excellent examples in H.R.H. the Prince of Wales and the Prime Minister, who both flew about their business. The Club owed its conception to the foresight and hard work of the Aviation Committee of the Chamber of Commerce, who although they had been thwarted over the Municipal Aerodrome were now doing their best for this club.

They had already had the advantage of a good deal of publicity, but he wondered if it would be possible to get a certain well-known aviator, whose exploits with trees and councillors received much publicity, to come and test their trees and councillors! They now had their own aerodrome and it was temporarily equipped and also passed by the Air Ministry.

He thanked the donors of the first machine and said that he understood that it might become two or even three machines very soon. What they now wanted was support from all, as they must have an Instructor and a Ground Engineer. When they had these, and the club was a live and going concern, he felt sure that the citizens of Leicester could rest assured that the Club would be of real use to them and to the Chamber of Commerce.

Thanking Lord Thomson for coming, he said that though he (Mr. Everard) was one of those who did their best to see that he was not made Secretary of State for Air he was very glad to have the honour of having him here to-day.

Lord Thomson said that he regarded it as a duty and as one of the principal functions of his office to encourage civil aviation and to assist its development. His dream was to see Civil Air Transport on the same basis as the Mercantile Marine, a widespread system entering into the lives of all our fellow-countrymen fostered and fed by an aircraft industry whose products would be the finest in the world, a system which would open up new markets for the sale of British goods. Only by being in the forefront of every development could we hope to keep our position in the World.

Mr. Purt, the very able Secretary to the Club, had written to him suggesting four points on which to particularise in his speech. He was not accustomed to generalise from the particular, but in this case he would bow to the commands of their Secretary. The four points were (1) Flying in general, (2) what it means to Britain, (3) the value of flying clubs, (4) why private individuals should back the clubs.

On point (1) he had come to the conclusion that he could not do better than quote a prominent official in the Air Ministry who had devoted nearly all his life to aviation and who had done a very great deal for civil aviation. . . . "15 years ago, before war distorted everything to do with flying, the trend was toward civil flying and military interest was less than civil interest; war however equalled up this, and while cost became of secondary importance high performance became paramount. Peace left a distorted view and flying was thought to be dangerous, machines overpowered, and pilots reckless. Regularity and normal development gradually came out of this turmoil through the artificial means of a Government subsidy. . . ." This, said Lord Thomson, exactly expressed his views.

On point (2) he said that flying meant to Britain increased efficiency and strength, but not strength of an aggressive type. Air transport must be World-wide to conform with the nature of our Empire. Recently they were horrified by the disaster in the Channel. Did they realise that since 1925 there had been 19,000 crossings of the Channel and only three forced landings in it, only one of which was fatal? If they compared that with any form of transport they would find that aviation came on top. Our pilots were second to none—ask any habitual air traveller which pilots they preferred.

The value of flying clubs was not, as so many uninstructed people seemed to think, to train war pilots. To compare the superb young pilots who by virtue of their specialised training were fitted to carry out the manœuvres over Hendon to the club pilot would be like comparing those who ride a hack round Rotten Row and those who hunt in Leicestershire. The real value of clubs lay in educating the public in air sense. Aviation was far more than a thing to be applied to war, and the clubs and their work enabled people to understand something of air transport, a form of transport which was far safer than the road. On the road you could never be sure of what the other man was going to do but in the air you had more room to avoid them; it was this elasticity of movement that was going to save so much time in business by allowing them to go direct to places.

Clubs as such, he said, appealed to him and he wished to do all he could for them. As regards subsidies everyone objected to them in principle, but he noticed that they always accepted them in particular. Lord Thomson said:—

"I am going to be extremely indiscreet, but I will say this to those who organised this club, and I do so with the full consciousness that sitting next to me is one of the representatives of the Air Ministry. I say to you here and now that ever since the inauguration of what is called the Guest scheme I have said publicly and privately—and for the moment my word is law in a certain department—that I am prepared, so far as resources permit, and I propose to extend them if I can get over a certain mountain known as Snowden—(laughter)—I am prepared to extend the principle of paying by results, and you will always find a sympathetic person at Gwydyr House."

The High Sheriff, Sir Harold Nutting, proposing the Leicestershire Aero Club, said that he felt he was not the man for the job as he knew nothing of flying, but he was very struck with the keenness of all those connected with it and wished them all the very best success. He felt they had the right man as President and with the backing of the Chamber of Commerce could not fail to do well.

Mr. H. Purt, the Hon. Sec. of the Club, replying, said that he now fully realised that the secretary was after all only the tool to be used by those who had ideas as to how things should be done. Thirteen years ago Leicester raised 2,500 guineas to pay for an aeroplane and they got no change. [The reference here is to subscriptions raised by various communities to buy aeroplanes for the Royal Flying Corps. As a rule these machines were crashed within a week or two by some reckless young flying officer, so the givers got but little commemoration or advertisement out of them.—C. G. G.]

The same sum, he said, would now put the club on a firm financial footing and he appealed to the people of Leicester to come forward and provide men, money and machines. There was every hope of their having three machines before long and this would give them an earning capacity which would put them on their feet.

The Lord Mayor (Alderman H. Hand), proposing the Chairman, said that it was a pity that some members of the Council were not very farseeing, as they could not stay behind much longer, and now that they had the Club they must go on and have their own municipal aerodrome as well. He thanked their chairman, Mr. Lindsay Everard, for the admirable lunch and for the sporting way which he had backed up the club. Leicester, he said, had always played a part in progress and she must not be backward now. He hoped to see the time when goods and newspapers were carried everywhere by air.

The Chairman then thanked everyone for all they had done and asked them to continue the good work.

OUT INTO THE WEST.

On July 25, Mr. G. F. Storey, of Hythe, who was the first *ab initio* pupil trained by the Cinque Ports Club, left Lympne for Ballinrobe, County Galway, Ireland, in his Moth G-EBTZ. He went straight through in the day by Hooton and Baldonnell in weather which was sufficiently bad to stop flying on Club aircraft at Lympne during the afternoon. This is about the best performance yet put up by a member of the Club, and the other members would like to congratulate Mr. Storey on an excellent show. [But why should anybody want to go to Ireland?—C. G. G.]

AVIANS IN NORWAY.—Here is seen Lieut. Alf. Gunnestad with the Avro Avian (Cirrus engine) which he flew recently to Norway. He is associated with Lieut. Meyer, who also was formerly in the Norwegian Army Air Service, in handling Avian sales in Norway.

THE AUCKLAND AERO CLUB.

The Annual General Meeting of the Auckland Aero Club was held at Auckland on June 27. The Report stated that the progress of the Club during its first year had far exceeded the expectations of the Committee in spite of delay in the arrival of the two aeroplanes on loan from the Government. The first had not been delivered until late in February. Major Cowper had been employed as organiser and the success was largely due to his energy and knowledge of commercial aviation. The Committee gratefully acknowledged the assistance obtained from the Australian Aero Club and their booklets.

In presenting the Balance Sheet as at April 30, 1929, the Committee said that the accounts were highly satisfactory especially when it was considered that flying (the most important source of income) had not started until Feb. 17. Adequate provision had been made for depreciation and replacement of plant.

The membership figures at the close of the year were Pilot Members 16, Pupil Members 67, Associates 326.

The Club hoped in future to be able to devote part of its resources towards social activities.

Instruction and passenger flying began on Feb. 17 with one D.H. Moth issued by the Defence Department. On Feb. 28 the *New Zealand Herald* had made the Club the magnificent gift of a D.H. Moth. On April 15, the Instructor had brought the second machine on loan from the Government back from Christchurch with him.

From Feb. 17 to April 30 the number of hours flown had been 198 hours 20 minutes. There had been no mishap whatever and consequently no repair expenditure.

The Committee wished to place on record its appreciation of the valuable work of Maj. G. A. C. Cowper (Instructor), Mr. R. J. Copley (Ground Engineer), and Mr. L. Anderson (Assistant Ground Engineer).

The Club had entertained Sq. Ldr. Kingsford Smith and the crew of the *Southern Cross* on their arrival in Auckland and the visitors had generously given £21 for the establishment of a fund to buy a light aeroplane.

On April 20 the Club had held its first Annual Pageant which had been financially successful and had possibly provided enlightenment to the public.

THE BOMBAY FLYING CLUB.

The first number of the Bulletin of the Bombay Flying Club contains the information that the membership of the Club is now 161, that 11 "A" certificates have been obtained by members and one "B" certificate. The number of flying members under instruction is 19 and 45 are on the waiting list. The Club owned two aeroplanes and two of the members were private owners.

The Club had been formally opened on Jan. 13, 1929, by Sir Victor Sassoon.

His Excellency the Governor of Bombay, Sir Frederick Sykes, had become Patron of the Club and had been a Guest of Honour at a Dinner at the Taj Mahal Hotel on March 21. His Excellency and Sir Victor Sassoon both made speeches, which were broadcast, and the guests and members contributed the cost of one Moth machine.

The machines have flown over 500 hours without accident.

A number of useful and valuable gifts have been made to the Club by various friends and members.

THE MIDLAND AERO CLUB.

The Midland Aero Club beat its record for flying time during the week ending July 20. The total time was 63 hr. 26 min., which is 13 hr. better than the previous record.

Mr. T. W. J. Nash, A.F.M., has been appointed Assistant Instructor to the Club under Mr. W. H. Sutcliffe.

MOTH NEWS.

On Aug. 3, Mr. Lief Lier, a well-known Norwegian pilot, left Stag Lane in a Gipsy-Moth for Norway. His machine will be used for whale-spotting, and will form part of the equipment of the s.s. *Kosmos*, the flagship of a fleet of Norwegian whalers leaving for the Antarctic on Aug. 10.

On Aug. 5, Lieut. R. R. Bentley arrived at Heliopolis in his D.H. Moth, with an American passenger, who has chartered the machine for a flight from Johannesburg to Berlin by way of Egypt, Syria, and Turkey.

A Gipsy-Moth forms part of the equipment of the British, Australian and New Zealand Antarctic Expedition, which under the leadership of Sir Douglas Mawson left the London Docks in the *Discovery* last week. An Australian pilot will be picked up at Cape Town, and the Moth will be carried on deck folded so that it can be hoisted over the side at a moment's notice.

It is fitted with floats, but an interchangeable ski undercarriage forms part of the equipment, so that the machine may operate from snow. The Gipsy-Moth carries full wireless equipment, and it will be used for making observations and for photographic work in the Antarctic.

THE FLYING CLUBS (MONTHLY REPORTS).

Bristol and Wessex Aeroplane Club Ltd.

Report for the month ending July 31, 1929.

[Sec.: Major G. S. Cooper, D.S.O., The Aerodrome, Patchway, Glos.]

Telephone and telegrams: Filton 53.

Instructors: E. B. W. Bartlett and L. A. Egglesfield. *Ground Engineer*: A. W. Webb. *Machines in commission*: 2 (TV, XF).

Flying Time for July: 124 hr. 15 min.; *Pupils Instructed and Hours Flown*: 30 (77 hr. 40 min.); *Soloists and Hours Flown*: 6 (9 hr. 5 min.); *Licensed Pilots ditto*: 16 (29 hr. 30 min.); *Passengers Carried and Hours Flown*: 44 (11 hr. 20 min.).

The items of chief interest for the month were (a) addition to the Club staff of Mr. L. A. Egglesfield, who joined us as additional Instructor, and (b) the increase of our machines to five with an additional Moth XF. YH has been out of commission for complete overhaul the whole month and the extra machine has been invaluable. The cost of the machine is being raised by voluntary subscriptions, the total now promised or received having now passed £25

Mr. Leaver, the Hon. R. Westenra, Mr. W. H. Amory, Lady Somer and Mr. F. D. Butcher passed their "A" Licence tests.

The event of the month was the King's Cup Race. Judging by the complimentary letters of thanks we have received from competitors we feel we coped successfully with the occasion. In spite of the rac passing here on a Friday the Club profited financially. The aerodrome organisation was in the very capable hands of Mr. C. Holmes, as last year. We were fortunate in having the very willing and able assistance of the recently-arrived R.A.F. details, and addition the Rev. Mr. Gay and his Boy Scouts.

Mr. Bartlett emulated his victory at Blackpool last year by winning the Club Aerobatic Competition at Heston.

The Club official holiday is the latter half of August, but flying will continue during that period under Mr. Egglesfield.

We are intending to hold an Aerial At Home on Sunday, Sept. 8. Details are not complete, but it will be worth attending. This will wind up our stay at this aerodrome as we are due to move to the new Bristol aerodrome on Oct. 1. Plans for the Club House have been approved and we shall have the best in the country.

The Hampshire Aeroplane Club.

Flying Time for the month ended July 31, 1929.

Total Time for the Month: 165 hr. 25 min.; *Dual*: 91 hr. 35 min. *Solo*: 25 hr. 25 min.; *"A" Pilots*: 38 hr. 45 min.; *Instructors' Solo and Passengers*: 9 hr. 40 min.

The Club has purchased a new Gipsy-Moth, which will be collected after the holidays. The veteran OH is also ready, so we shall have four machines.

Members are again reminded that the Club has chartered the Isle of Wight steamer *Prince of Wales* for the use of members and their friends on Sept. 7, the date of the Schneider Trophy Contest. Tickets are now available and those who desire them should get in touch with the Secretary as soon as possible. Tickets, exclusive of refreshments, are £1 1s. each and all applications must be accompanied by a remittance.

The Nottingham Aero Club.

Report for July, 1929.

Analysis of Flying Times.— *"A" Pilots*: 48 hr. 30 min.; *Soloists* 9 hr. 55 min.; *Instructor—Tests*: 3 hr. 10 min.; *Passengers*: 6 50 min.; *Dual*: 51 hr. 55 min.—61 hr. 55 min.—120 hr. 20 min.

INDIA'S FIRST AVIATRESS.—Mrs. Petit of Bomb and the Club Instructor, Mr. Cummings.

Digitized by Google

Digitized by Google

"A" Licence pilots who flew during the month were Lord M. Douglas-Hamilton, Sub-Lieut. Cliff, R.N., Messrs. Ball, Bradley, Granger (F.), Kay, Hutchinson, Selvey, Shipside, Taylor, Warren, Winn (Chairman of the Leicestershire Aero Club), and Wynn of Derby. Messrs. Hurst and Gallimore, both ex-Service pilots, completed their time early in the month for their "A" Licences.

Mr. Gallimore returns shortly to India, where he threatens to stir up a state of airmindedness amongst his friends on rejoining them. Mr. Hurst is a member of the Committee of that newly-formed and "go ahead" club at Leicester. We fear we shall not be seeing much more of him as our neighbours shortly expect to begin operations.

Soloists who turned up during the month were Messrs. Cudlip, Gallimore, Hurst, Sail, Smith, Granger (J.), and Nicholson. Our orgy of first soloists did not materialise, but those of them who did complete their first solos, namely Messrs. Sail, Smith, Granger (J.), and Nicholson, all put up remarkably good efforts. Excluding ex-Service pilots our record for minimum dual prior to solo was twice beaten this month. Mr. Smith went off in 5 hr. 20 min., thus lowering Mr. F. Granger's record, which had so long stood at 7 hr., but Mr. J. Granger, a younger brother of the old record holder, set out to recover this for the family fold, which he did ten days later, going off solo in 3 hr. 20 min.

General.—The Lord Mayor of Nottingham, Alderman A. R. Atkey, honoured our Club twice during the course of the month by flying to Gosport. First he went with Mr. Wynn to attend a conference at Portsmouth, returning most of the way by air, despite very adverse weather, which finally compelled them to land when within 20 miles of the city. On the second occasion, in company with our pilot instructor, he flew to Stag Lane to collect the licence for the city's new airport at Tollerton, which he declared open upon his return the same day. On this last occasion Alderman Atkey flew in his robes of office in order to pay homage to the Under-Secretary of State for Air (Mr. Montague) and the Director of Civil Aviation (Air Vice-Marshal Sir Sefton Brancker).

Our flying time is good this month when realising that out of the 24 days on which we flew, only for 10 days were both machines in action together. This reflects great credit on our members whose enthusiasm is unbounded, and one ventures to think what might have been possible had the Club been in the fortunate position of having its own Club House and ground. At the moment we await a favourable answer to an application to stay on just one more month at Hucknall!!—R. Lee Bateman, Flt. Lt.

The Phillips and Powis School of Flying.

[Managing Director: C. O. Powis, Reading Aerodrome.]

Report for month ending July 31.

Flying Time: 91 hr. 50 min.

Instructors: Flg. Off. R. T. Shepherd, Mr. H. B. G. Michelmore.

Notes.—We have taken delivery this month of our new demonstration Gipsy-Moth, which is greatly admired, and has been kept very busy.

Mr. A. L. Hill has taken delivery of a second-hand machine from us this month.

We are installing a Moth Showroom on the aerodrome and will keep a new Gipsy-Moth in stock for immediate delivery.

On July 11 an R.A.F. Squadron from Farnborough used our aerodrome for exercises and reported very favourably of the site.

Capt. and Mrs. Pim have joined the School and are making very satisfactory progress.

THE STAG LANE ACCIDENT.

The inquest on the bodies of Flt. Lt. A. S. White, chie demonstration pilot of the De Havilland Aircraft Co., Ltd. Mr. F. L. Knight, and Mr. G. F. Boyle, who were killed i an air collision near Stag Lane aerodrome on July 29, wa held at the Hendon Town Hall on Aug. 1.

Mr. A. J. Brant, service manager of the De Havillan Aircraft Co. Ltd., said that both machines involved wer Gipsy-Moths. The machine owned and flown by Mr. Boyl was a new single-seater in perfect condition, and the two seater was a demonstration machine owned by the compan and was only a week old. Mr. Boyle was making a tria flight and Mr. White was giving a demonstration for Mr Knight.

Two witnesses said that the left wings of the tw machines came in contact.

Major Cooper, the Air Ministry's Inspector of Accident said he was of the opinion that the right-hand wings of on machine came in contact with the right-hand wings of th other machine. When asked by the Coroner how he ex plained the fact that two witnesses saw the left wings com in contact he said that this was explainable by the fac that both witnesses were some distance away.

Evidence showed that one machine was in a right-han turn and that the other was flying straight. A good man things could have caused the accident and it was possib that both pilots misjudged their position.

The jury returned a verdict of "Death by misadventure

THE HANWORTH ACCIDENT.

The inquest on the body of Jack Harley Caulfield, a pil employed by National Flying Services Ltd., who died hospital from injuries received in an accident on July at Hanworth, was held at Hounslow on Aug. 2.

Mr. T. N. Stack, giving evidence, said that Mr. Caulfie was flying at about 300 ft. He rolled his machine, made bad recovery, lost speed, and then dived in what appe to be part of the first turn of a spin into the top of so trees, which were about 60 ft. high. The firm's regulati was that there was to be no stunting below 1,000 ft., a their pilots have complied with this regulation except this occasion.

Mr. Caulfield, who had been engaged primarily as "stunt" pilot, had been warned and ordered not to stu below 1,000 ft.

Mr. James Rodney, an official of N.F.S., said that he hi self had warned Caulfield, who was rather in the habit flying low, from doing so, and the witness said that he h had complaints from people in the neighbourhood.

Major J. P. C. Cooper, the Air Ministry's Inspector Accidents, said that an examination of the machine reveal no defect in the structure or controls.

The jury, without retiring, returned a verdict of "Dea by misadventure."

IN SEARCH OF SPEED.—An Avro Avian (Genet Major, 110 h.p.) with a Townend ring.

Flying—
at 3¼d. a mile.

PRACTICAL flying at a reasonable cost is one of the principle advantages to be derived from membership of the N.F.S. organisation. For the avarage member, it is estimated that £25 will cover the cost of learning to fly. When competent, the member has the privilege of hiring modern light aircraft for his business and pleasure journeys, at rates starting from 30s. an hour, scaling down to 27s., 24s., and 21s., an hour (i.e. from 4½d. to 3¼d. a mile), according to the amount of flying done in the year. These rates include insurance of the machine, fuel and oil, and free service at all the N.F.S. stations; besides embracing the fullest use of the N.F.S. clubs, of which the London Air Park and Country Club at Hanworth is the first to commence operations.

**Write to-day for the N.F.S. brochure that will give you complete information regarding the services offered by the N.F S. to all who wish to fly. A trial instructional flight is provided at a small inclusive charge for the benefit of those who are still unconvinced of their ability to control an aeroplane.

A limited number of members are now being admitted to the Hanworth Club at the following rates: Flying members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-Flying members, 3 gns. in each case For this year, two-thirds of the annual subscription is rebated. Membership of one Club confers Honorary Membership of all other N.F.S. Clubs.

Croydon Notes.

It has long been the custom of our newspapers, just before holiday week-ends, to give us accounts of the terrific rush—always greater than ever before—of holiday travellers. It may be thought something of a compliment to commercial aviation that Croydon is now regularly included in these accounts, and takes its place alongside Waterloo, Victoria, and Paddington. But, nevertheless, and despite the reports of an overwhelming rush of air travellers, and the interesting accounts of holiday incidents, those who are constantly in touch with the Air Port know that the holiday week-end makes very little difference to the amount of traffic.

Aircraft on all the lines were filled to capacity. Every available machine was on service. But that has been the happy state of affairs for quite a long time past, and is not merely a holiday boost. On an average, the authorities handle about forty-five machines a day.

The A.N.T.-9 monoplane belonging to the Union of Socialist Soviet Republics, which arrived at Croydon during the early part of the week, continued on its way, leaving Croydon for the Continent on Sunday. Most people who saw it were pleased with its general lines and the comfortable interior arrangements. The installation of the three Titan engines is neat, but they give the impression that a machine of that size and load requires a larger reserve of power. [One is moved to wonder whether the machine is fitted with Communist controls, so that all the passengers pilot it at once.—ED.]

Another visiting aeroplane which was keeping people from their work and wives was the Ford monoplane (three Pratt and Whitney Wasps). It came from the Aero Show at Olympia and set out for a tour of Europe on Saturday afternoon. Its ground manœuvrability appealed most.

As an instance of this, it came along down wind on Saturday morning from the compass base, and to the horror of those unaccustomed to wheel brakes, charged at a terrific speed down the incline before the factory hangar, through a number of other machines. It then turned completely round in its own length and stopped exactly where its pilot wanted it. When they had recovered from the shock the onlookers gathered round and made a rare fuss of it.

It was rather unfortunate for the Russian that the Ford, resplendent in its shining armour, should park itself alongside, for although people did not lose sight of the fact that the Russian had been doing a long tour, they felt that a cask of metal-polish included in the spares for such an emergency would have shown admirable foresight.—C. A. S.

Scenes as heartrending as those witnessed when an infant loses the key of its clockwork aeroplane were witnessed at Croydon Aerodrome recently. A father, in answer to his small boy's inquiry why the big aeroplane would not go was heard to reply that a naughty man had sent all the keys they wound it up with to Paris.

Volleys of abuse were showered on helpful-minded persons who proffered watch keys or staggered up to the perspiring crowd round the machine with hydrant keys and those huge keys with which hangar doors are opened and shut. A total stranger, happening to whistle "I've got the key of the door, never been twenty-one before," was expeditiously slaughtered and buried with full military honours at the edge of the tarmac at about 2 p.m. The Aerodrome idiot, his eye fixed apprehensively on a huge mechanic wearing a dark scowl and a very big spanner, refused to discuss the incident.

Quoting somewhat sagely from Old Moore's Aeronautical Almanac, he said, "Them as names no names, butters no parsnips" (for application, soothing like, to thick ears). He further remarked somewhat cryptically that all was not always gold wot glittered, especially when the blinking latch-key had gone missing.

On Monday night, between 10 p.m. and 10.30 p.m., three or four night landings were made. First came a K.L.M. Fokker, then a Luft Hansa plane, and finally a big silver Argosy.

The Aerodrome at night with its grass turned silver by the landing light, its endless rows of ruby-coloured boundary and obstruction lights, its lit wireless masts like slender Christmas trees and the glare of the almost scarlet neon beacon is a subject for an artist. We do not mean one who gets his impressions of life by hanging head down from a taxi roof on boat-race night just before being violently unwell, but what our Fathers of old simply called "An Artist."

Some amusing comments were found recently written in two separate feminine hands upon a "Notice to Passengers" dropped in the cabin of a commercial plane. Certain clues will probably lead the reader to guess the nationality of the fair ones.

A. Why aren't you riding with the pilot? B. I took one look at him and decided to be where I am.

A. Is he so awful? I haven't seen him yet. B. The one I saw was short, fat and maybe bald.

A. Maybe he has the fat man's disposition, and after all that *is* a help. (Organ P. Golley was the pilot surely, the description is too apt to admit of any mistake. B. (changing the subject) Coffee and sandwiches, how's that for a nice "airy" luncheon?

A. Celestial fare. B. (suddenly mistrusting the English cuisine) Maybe they have *tea*. They *have* lunch boxes probably cold lamb, cabbage and boiled potatoes.

A. (apparently some time later) I have changed my mind (oh coffee!) about reading this trip. B. We'll probably feel the change from 4,000 to 3,000 feet.

A. (not too bright) You said a mouthful, Queen.

A recent advertisement of a well-known Air Transport Company describes the steward as serving refreshments whilst flying. Probably he has become expert in serving drinks during those downward bumps which leave him hovering in mid-air over his customer like a beneficent angel.

A stranger of retiring disposition at Olympia came up to the three-engined Avro 5 and peered at it nervously. An attendant sprang briskly forward and asked whether he could give any information about this new type of aeroplane.

"No, thank you," said the stranger edging away towards one of those too-handy bars. He had been with K.L.M. very nearly ten years, and sort of thought the "new" type was vaguely familiar to him.

AIR MAILS FOR NEW ZEALAND.

The Postmaster-General announces that the Air Mail service which was recently established between Perth and Adelaide in Australia is now available for correspondence for New Zealand.

The latest times of posting are the same as for ordinary mails for New Zealand via Suez and the air fee is 3d. per *half* ounce.

Correspondence for New Zealand sent by this air service will gain about a week over that sent by the ordinary route via Suez.

AIR MAILS FOR N. AND W. AFRICA.

The Postmaster-General announces that owing to a revision of the charges made by the French Post Office separate rates of air fees are now charged for (a) letters and postcards and (b) printed and commercial papers and samples. The revised fees are as follows:—

For letters and postcards.—For Algeria, Tunis and Morocco, 4d. per half oz. For West Coast of Africa, 1s. per half oz. (as at present).

For printed and commercial papers and samples for Algeria, etc. 4d per oz. For West Coast of Africa, 8d. per oz.

THE STABILIZED MINÉRAL OIL

Digitized by Google

THE MUNICIPAL AERODROME AT NOTTINGHAM.

On July 27, as reported in THE AEROPLANE of July 31, Alderman Atkey, the Lord Mayor of Nottingham, flew from Nottingham to Stag Lane Aerodrome in a Moth belonging to the Nottingham Aero Club. At Stag Lane the Lord Mayor was met by Sir Sefton Brancker, the Director of Civil Aviation, and Mr. F. Montague, our new Under-Secretary of State for Air.

The latter handed to the Lord Mayor the Air Ministry licence for the use of Tollerton as a civil aerodrome, and the Lord Mayor was then flown back to Tollerton,—which is Nottingham's new municipal aerodrome.

The aerodrome was then officially opened by the Lord Mayor, who, arriving from Stag Lane in his robes of office, handed the licence to Sir Albert Ball, who is chairman of the Nottingham Municipal Aerodrome Sub-committee.

After the inaugural ceremony a lunch was held at the Tollerton Country Club, with Sir Albert Ball, who is the prime mover of the scheme, in the chair. Sir Alan Cobham, who was to have been present at the inaugural ceremony, in his D.H. Giant-Moth, was unable to arrive. A mishap at Doncaster had forced him to go to Stag Lane for spares. He flew down in a Moth from Stag Lane in time for the lunch and then continued his journey by air to Doncaster, whence he returned later in the day with the repaired Giant-Moth.

Sir Alan proposed the toast of Nottingham's Municipal Aerodrome, and congratulated the City on being the first to open a permanent municipal aerodrome.

Sir Albert Ball replied and said that flying was no longer a pastime for the wealthy but a commercial proposition. The City Council realising they could not lose money by the venture had bought Tollerton Aerodrome but were refraining, however, from putting up extravagant buildings.

He said how much the Council was indebted to Mr. Wallis Gordon, the City Engineer, and Mr. A. Stone, of Stoke Farm, for the way they had levelled the aerodrome.

Later in the afternoon the Giant-Moth arrived from Doncaster. Sir Alan Cobham then took the Lord Mayor and members of the City Council for a trip over the City. The Lady Mayoress and Miss Ivette Atkey were also taken for a trip. From then onwards Sir Alan Cobham was busy taking up parties of school children.

Nottingham is to be congratulated on its enterprise. The city has secured close to the city and in open country a fine aerodrome. Only half a mile away is the Country Club of Tollerton, where those who come down from the air in aeroplanes may rest and recreate in comfort,—and Tollerton Hall claims to be one of the finest, and quite the most up-to-date country club in Great Britain.

As the Nottingham Aero Club is moving from Hucknall to Tollerton, the new ground will soon be full of aerial activity.

The City has now an airport only a flying day's journey from the Continent, and the capitals of Berlin, Amsterdam, Brussels and Paris. This means that buyers of Nottingham's products can reach their goal comfortably and speedily without the tedious business of train journeys and boat journeys, together with the frequent breaks and Custom-nuisances that such a mode of travel involves.

Quite apart from feathering its own nest Nottingham deserves to be congratulated on the step it has taken to popularise civil flying. As the advent of mass-motoring has necessitated re-making all roads so flying will require good ground organisation. The proper way to do this is for each town, village, borough or city to acquire suitable land and get it licensed. Agents, Service people, Clubs, Petrol and Oil suppliers, and Schools will do the rest.

THE SINGAPORE AERODROMES.

At a recent meeting the Straits Settlements Legislative Council agreed to a motion providing $50,000 for the acquisition of a piece of land as a reserve for a Civil Aerodrome.

At the present moment, in Singapore, aeroplanes can only land at the Racecourse, on Balestier Plain, and, by courtesy of the authorities of the Air Base, some have been allowed to land at the aerodrome at Seletar. The first two sites are in the way of town development, and the Service aerodrome at Seletar cannot, of course, be indefinitely open for civil use.

THE COUNCIL OF THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS.

The following have been elected as Officers of the Society of British Aircraft Constructors Ltd. for the year 1929-30:—

Chairman—Mr. F. Handley Page, C.B.E. (Handley Page Ltd.).

Deputy Chairman (Aircraft)—Mr. R. A. Bruce (Westland Aircraft Works (Petters Ltd.).

Deputy Chairman (Engines)—Mr. A. F. Sidgreaves (Rolls-Royce Ltd.).

Hon. Treasurer—Mr. John Lord (S. E. Saunders Ltd.).

THE CIVIL AVIATION CONFERENCE.

On August 7 a Conference took place in London between the French Air Minister, M. Laurent Eynac, and our Secretary of State for Air, Lord Thomson. The object of the conference was the discussion of co-operation between the French and Civil Aviation interests in those parts of the World where French and British air lines run together. M. Laurent Eynac was accompanied by M. Camerman, Director of Civil Aviation in France, and Lieuts. Bos and Pequeur. Lord Thomson was assisted at the conference by Sir Sefton Brancker.

On the evening of August 6 a dinner party was given at the Ritz when, in addition to those officials already mentioned, the party included Mr. Macdonald (the Prime Minister), the French Ambassador, Lieut. de Vaisseau Sala (the French Naval Air Attaché), Air Commodore Newall (Deputy Chief of the Air Staff), Sir Walter Nicholson (Secretary of the Air Ministry), and Mr. Oldfield (Assistant Private Secretary to the Secretary of State for Air).

One gathers that among the precise points to be discussed are the following:—(A) A linking system between the Cape-Cairo line and the line which the French are organising across the Sahara to join the Belgian Congo route which now reaches the Rhodesian Congo frontier, with a cross-line to Madagascar. (B) Co-operation between the French air route which will run along the Mediterranean to Palestine, and so across to the upper waters of the Euphrates and down to Baghdad, with the existing Imperial Airways line by way of Egypt,—which incidentally ought not to go to Egypt at all but ought to go by Malta and Cyprus to Jaffa. The French line, which must obviously follow the Imperial Airways route from Baghdad to Calcutta, would then extend to the French possessions in Indo-China. There is no doubt that a double air-line to the East with French and British co-operation will ultimately be of great strategic value to us when the struggle comes for the command of the Pacific and the possession of Australia.

(C) Finally there is the question of co-operation in the line which the French are already running to South America. This line at present runs from Paris to Dakar on the West Coast of Africa whence the mails are taken by fast steamers to Port Natal in Brazil, whence they are flown all the way down the East Coast of South America to Buenos Aires. There are many ways in which British co-operation would be valuable on this route.

SKY-TALKIES.

An advertising organisation is proposing to introduce a new form of aerial advertising to this country. Loud-speakers will be built into the fuselages of five D.H. Gipsy Moths, and messages delivered into a microphone and amplified by a 260-watt amplifier will be plainly audible over an area of two to three square miles from a height of 1,500 ft.

The organisers claim that they have ascertained that there are no regulations which will prevent the project from being carried out. [There seems some hope that the perpetrators of the outrage may have to be carried out, when infuriated citizens have dealt faithfully with them after they have landed.—ED.] But if they propose committing this new form of hate over cities and towns they will find that they will not be allowed to do it at 1,500 ft.

This device was tried out over New York some considerable time ago, but one cannot recall having heard of its success.

Whether New York was discerning enough to object, or whether there was so much noise caused by people hustling that it was not noticed, one does not know. One does venture the opinion, however, that it will not be popular over here. If only scientists devoted their attention to making things silent instead of making everything talk, scream or roar life would be very much more pleasant.

At the

AERO EXHIBITION, OLYMPIA

ESAVIAN
Folding & Sliding
DOORS

proved a great attraction. Many enquiries from abroad were received for Doors of forty and fifty feet in height. The Winding Gear (Patented) enabled the Doors to be opened and closed by boys.

The Doors are hinged to the sliding upright (Patented). These uprights slide with the greatest ease, being fitted with purposely made ball bearing runners which carry the weight of the Doors with safety.

Doors of 25 feet high and upwards stand at an angle, the position being regulated by hinged stays, and are thus able to withstand the greatest wind pressure.

We shall be glad to send you pamphlets and detail prints immediately on request.

A letter has already appeared in *The Times* from a habitué of one of the best clubs protesting against this new form of advertising horror, in which he rails at the pollution of the sky on fine days with trails of smoke in the form of letters advertising various goods. If we are to innoculate the country with "airmindedness" we must not disturb even the most respectable clubman with objectionable noises, or else we must make everything else so noisy that flying to Paris in an Argosy will be recommended by doctors as a nerve sedative

But why drag in sky-writing? The sky over England is so often polluted by masses of rain clouds that a bit of blue sky, even if it is momentarily decorated with a fluffy representation of the name of somebody's patent soap, is very welcome, and cannot possibly disturb even the most irritable member of Clubland who happens to be suffering from post-prandial insomnia.—L. B.

BUG-DUSTING IN CANADA.

In Canada millions of dollar's worth of damage is done annually to field and orchard crops, forest and shade trees, stored products, etc., by insects. For a good many years efforts have been made to control these pests. One of the chief agencies in the campaign is the Entomological Branch of the Department of Agriculture.

A division of the work of growing importance to Canada is that engaged in the suppression of forest insect pests.

The Forest Insects Division of the Entomological Branch in co-operation with the R.C.A.F. has been endeavouring for some time to provide a method of controlling outbreaks of defoliating insects by distributing poison dust by aeroplane over the infested areas.

During the Summer of 1927 the Forest Insects Division in co-operation with the R.C.A.F. and the Forest Services of the Dominion and of Nova Scotia made a number of experimental dusting operations with calcium arsenate in Cape Breton Island and Antigonish County, in Nova Scotia.

The experience gained in that experiment justified a continuation in 1928. Severe infestations of the spruce budworm in Northern Ontario were attacked under conditions more favourable for such experimental work. In both seasons a large number of relatively small plots was treated. Information of much value was secured and the work will be continued in Northern Ontario this year on a larger scale.

The operations will be under the direction of the Fore Insects Division, and the R.C.A.F. will provide a three-e gined Ford monoplane specially equipped for the distrib tion of poison dust. The Ontario Forest Service will supp the dust and will otherwise assist in the ground operatio

The proposal is to dust several areas between half a m and a mile wide, using poison of several degrees of strengt and the experimenters hope to obtain from this seaso operations definite data on the effect of this method on commercial scale and the cost of the operations under su conditions.

In the Muskoka region of Ontario during the last thr seasons extensive injury has been done to hemlock stan by defoliating insects. The Ontario Government For Service is providing a special aeroplane and the necess dusting material for control operations in co-operation w the Forest Insects Division.

The Division have been investigating present extensive o breaks of hemlock looper in stands of balsam fir pulpw on the north shore of the St. Lawrence river below Saguen This is the same insect which is causing so much dam to hemlock in the Muskoka region.

Experimental dustings which have been made by Division of Forest Insects working in co-operation with Nova Scotia Forestry Branch in 1927 and the Ont Forestry Service in 1928 indicate that when certain pra cal difficulties incident to the application of the poison d have been overcome, small outbreaks of insects may checked by this method before they have reached the demic stage in which they cause such tremendous fo damage.

Once these outbreaks have gained full momentum, h ever, artificial control is almost if not quite impossible. is also considered at present that the cost of aeroplane d ing would prohibit the use of this method on a very tensive scale but that the present method will prove p ticable and of use commercially for the protection of more valuable stands of pulpwood when threatened infestation.

CENTRAL AFRICAN ENTERPRISE.

The Angola Diamond Company has decided to buil aerodrome at Loanda, Angola, and to establish aerial nections with the S.A.B.E.N.A. Belgian Congo air se and the future Cairo-Cape route when it is opened.

HANDLEY PAGE
AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

SUPERFLEXIT TUBING

¶ This flexible tubing which has been so successfully developed on the Continent has been adopted by the French, Italian and Swiss Air Services.

¶ The Italian machine S.64 belonging to S.I.A.I. in which Commanders Carlo Del Prete and Ferrarin set up the World's Record Duration and Long Distance Flight in June, 1928, was fitted throughout with Superflexit Tubing.

Advantages.

A Lining having Absolute and Permanent Imperviousness to Petrol, Benzol and all Hydro Carbon Oils.

Extreme Flexibility. Light Weight.
Great Strength. Smooth Bore.

Unaffected by Continual Vibrations.
Unaffected by High Temperatures.
Capable of Withstanding High Pressures.

¶ The tubing is covered to meet all conditions of service, and special lightweight unions have been developed for the Air Services.

Superflexit Tubing was awarded 1st Prize at the Paris Exhibition organised by the Society of Aeronautical Propaganda in conjunction with the Aero Club of France held in 1928.

BROADENING THE OUTLOOK.

Readers of THE AEROPLANE who do not happen to be subscribers, and therefore did not receive the Special Issue of this paper published on July 12, are hereby informed that a limited number of copies of this issue can be had for 1s. post free, from THE AEROPLANE, 175, Piccadilly, W.1.

This Special Issue contains illustrations and full specifications of all the aircraft and all the aero-engines which were shown at Olympia. With these appears a brief historical note concerning each firm. Also the issue contains the names and addresses of, and a note on, the goods produced by, all the makers of accessories, components, materials and so forth who had stands at Olympia. Thus the Special Issue is in itself a complete directory to the British Aircraft Industry and to its ancillary firms.

The number of copies of this Special Issue is limited and they will be sent strictly in order of application.

THE NOTCHED INGOT.

The Notched Ingot is the name given to a booklet issued periodically by The Hoyt Metal Co. of Great Britain and described by them as a "Miscellany of Mechanical Topics." It contains some good photographs of modern power-plants and their application to present-day forms of transport,—ranging from aircraft to a steam-tug.

A number of useful hints on lining bearings is being given, in serial form. This number contains much useful information on the correct temperature required for melting white metal and some rough tests which will serve in the absence of a thermometer. This should be particularly useful ground engineers and to R.A.F. engine-mechanics,—even Henlow.

The Notched Ingot understands the value of history, a so gives an account of metal-working as practised a hund and more years ago. Here we learn that pewter, which rather fashionable just now, has been used domestic since Roman times, and regulations for the craft o pewterer were drawn up in England in 1348.

In the *Queries and Answers* section worried corresp dents who want information are soothed with the answer. Such queries range from the historical to severely practical one of the best way to re-metal bear of some unusual type.

There is much more of interest, including an accoun the Indian Airway.

The Notched Ingot takes its name from the familiar i of *Hoyt Number Eleven* antifriction metal, which help give the engines of the R.A.F. and of Imperial Airways t remarkable reliability.

Copies may be had from the Hoyt Co., Deodar Wo Putney, by mentioning THE AEROPLANE.

A SERIOUS OMISSION.

By an unfortunate oversight, the advertisement of Su flexit Ltd., of 110, Cannon Street, E.C.4, was omitted f the last issue of THE AEROPLANE.

This Company has produced a new form of flexible tu which has a lining which is permanently impervious petrol, benzol and hydro-carbon oils.

The tubing can be obtained in any length and is extre flexible, very light and very strong. Moreover, it is affected by continual vibration and high temperature a capable of withstanding very high pressure.

The Superflexit Stand at Olympia attracted much a tion and more is likely to be heard of Superflexit in country in the near future. It is already in general on the Continent and has been fitted to many record-b ing machines.

WELDABLE TUBE.

One or two readers of THE AEROPLANE seem to have understood a sentence written with humorous intent i Show Report on the exhibit of the Reynolds Tube Co. The writer of the report said:—

> The tube makers and the tube users are really getting do brass tacks, or,—in this case, chrome-molybdenum.

Some people have expressed surprise that chrome-m denum should be used,—and, as a matter of fact Reynolds Tube Co. do not use chrome-molybdenum. intention of the sentence was to indicate that tube m and tube users in these days knock chrome-molybd verbally, as one knocks brass tacks physically.

One of the great features of Reynolds tubing is tha made of a high-grade steel which, unlike chrome-m denum tubing, does not harden and become britt exposure to air after welding.

A CHEAP AIR TAXI.

The Brooklands School of Flying have for sale a (240 h.p. Siddeley Puma) in excellent condition co with C. of A. This type carries a pilot and four p gers in a roomy and comfortable saloon and has a c speed of 100 m.p.h., and makes an ideal machine f taxi work.

The price is £1,200 and is therefore very much c than any other four-seater air taxi now on the marke

MORTGAGES AND CHARGES.

SAFETEX SAFETY GLASS LTD.—Charge on freehold factory at dated July 16, 1929, to secure £5,000. Holders: Safetex Glass Company Ltd., 21, Great Portland Street, W.1.

PERSONAL NOTICES.

DEATHS.

BOYLE.—On July 29, while flying near London, George Boyle, late Capt., Royal Scots Fusiliers, aged 36 years

CAULFIELD.—On July 30, at Hounslow Hospital, as the re flying accident, Jack Harley Caulfield, aged 25 years.

SMITH MARRIOTT.—On Aug. 3, at Saskatoon, Canada, an aeroplane crash, Ernest John Bosworth Smith Marriott, monden Rectory, aged 27.

FORTHCOMING MARRIAGES.

DAVIES—BAVIN.—The engagement is announced betwee Davies (late Capt., R.A.F.), of 63, Harrington Gardens, S.W.7, son of the late Mr. and Mrs. G. F. Davies, and Margaret daughter of Major and Mrs. J. T. Bavin, of Berkhamsted, H

GUNTON—BROOKS.—A marriage has been arranged, shortly take place, between H. Desmond Gunton, formerly R son of Major and Mrs. H. C. Gunton, of Rathgar, Gerra Bucks, and Gwen, only daughter of Mrs. Charles Brooks, Chalfont St. Peter, Bucks.

LEARNING TO FLY

By
FRANK A. SWOFFER, M.P.E.,
Chief Instructor to the Hampshire Aeroplane Club; Late Instructor at the Central Flying School, R.A.F., Upavon.

With Foreword by
Air Vice-Marshal
SIR SEFTON BRANCKER, K.C.B., A.F.C.

Designed to give pilots in training a better grasp of the practical course of flying instruction. The book is simply written and is full of practical advice to all concerned with flying.

Crown 8vo, 156 pp. 7s. 6d. net. Illustrated.

Described by "THE MORNING POST" as "probably the most complete exposition of the methods of teaching generally practised."

PILOT'S "A" LICENCE: By John F. Leeming. Explains how to obtain a Flying Certificate, with other official information. Second Edition, 3s. 6d.

AEROBATICS: By Major Oliver Stewart, M.C., A.F.C. A simple explanation of aerial evolutions. 5s. net.

Order from a Bookseller, or direct from:
SIR ISAAC PITMAN & SONS, LTD.
Parker Street, Kingsway, London, W.C.2.

MISCELLANEOUS ADVERTISEMENTS.

All Advertisements for this column should arrive at this office by 6 p.m. MONDAY, to ensure insertion.

ALAN COBHAM AVIATION LTD.
150, NEW BOND STREET, W.1.
Phones: Mayfair 2908. 'Grams: Talsundar, London.

Consulting Aeronautical Engineer.—H. M. Yeatman M.,A. (Cantab), A.F.R.Ae.S., A.M.I.Ae.E., New Zealand Building, 429 Strand, W.C.2. Telephone: Gerrard 3672. All kinds of work in connection with the design, construction and operation of aircraft, Airworthiness Certificates, etc. Technical advice to private owners a speciality.

AIRCRAFT INSTRUMENTS.

Coley Ltd., Aircraft Surplus. Aeroplane landing wheels, new Palmer Cord Tyres, and tubes, 700 × 75 m.m. set two wheels and axle complete, 50s. carriage forward; KLG, F9 Plugs, new, in maker's boxes, doz. 9s. 9d.; Ogilvie Airspeeds, pressure heads complete, new 8s. 3d.; Smith's Indicators, 600-2,600 revs., 3 ft. drive, 22s. 6d.; Cross Levels, 1s. 6d.; Dashboard new spot lamps, 2 volts, length of wire, 1s. 9d. Above postage paid. Free list obtainable. Coley Ltd., Ordnance Works, Queen Elizabeth Road, Kingston-on-Thames. 'Phone, 0365.

AIR TAXIS.

Air Taxis Ltd., Stag Lane Aerodrome, Edgware. 'Phone: Colindale 6307.

Aerofilms Limited, Aerial Tours, Taxi Work, Aerial Photography, Air Survey. Colindale Avenue, Hendon, N.W.9. 'Phone: Colindale 6581 (2 lines).

AIRCRAFT FOR SALE.

Authorised Moth Agents.—Immediate delivery from stock. Demonstrations arranged—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

AIR SURVEY.

Air Survey Co. Ltd., 39, Grosvenor Place, S.W.1 (Sloane 6048), Dum Dum, Calcutta, and Monkey Point, Rangoon.

The Aircraft Operating Co. Ltd., 8, New Square, Lincoln's Inn, London (Holborn 8131), and Bulawayo, Southern Rhodesia; Cairo, Egypt; Rio de Janeiro, South America: Contractors to the Ordnance Survey. Laboratories and Subsidiary Company for aerial photography in the British Isles, Aerofilms Ltd., Colindale Avenue, Hendon (Colindale 6581).

AIRCRAFT REPAIRS.

No job too small or too large. Complete reconditioning for C. of A. Full certificated staff—keenest rates. Brooklands School of Flying, Brooklands, Byfleet.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office.

AERODROME LIGHTING.

Mobile Combined Beacon Floodlights, Emergency Signalling, Navigation, High Intensity, Lenses, Carbons, Strands, Cords. The London Electric Firm, Croydon.

AVIATION INSURANCE.

Advice given and rates quoted.—Apply to **Bray, Gibb and** Co., Ltd., Aviation Dept., 166, Piccadilly, London, W.1, and 14, Sherborne Lane, E.C.4. All classes of insurance effected.

AIRCRAFT PARK.

D. Watt, Brooklands Aerodrome, Byfleet 331. Houses machines and carries out overhauls of every description to aircraft and cars.

AIRCRAFT WANTED.

Aircraft purchased for cash.—Cars taken in exchange for aircraft. Deferred terms.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

Modern aircraft purchased for cash. Part exchanges for new machines.—Brooklands School of Flying Ltd. Telephone Byfleet 437.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, London, W.C.2.

FLYING CLOTHING.

No Connection with any other Firm.

S. LEWIS'S.—The Old Firm of Flying-Racing and Motor Clothing Fame, 19 and 27, Carburton Street, London, W.1. We wish our Thousands of Customers to know we have no connection with any other Firm. Flying Helmets, best Quality, Fur trimmed, 14s. 6d., 12s. 6d.; All Leather Lined Chamois, 10s. 6d., 12s. 6d.; Flat Type Phones, 5s.; Metallic Tubing and Rubber Connection, 2s. 6d.; V Piece and Adapter combined, 3s. 3d.; White Flying Suits, 25s. 6d.; Ditto, with Lightening Fasteners, 35s.; White Combination Suits, 14s. 6d.; White Flying Helmet, 6s. 6d.; Featherweight type Goggles, fitted genuine Triplex Lenses, slightly tinted, new W.D., 7s.; Ditto, fitted genuine clear Triplex Lenses, 11s.; Aviation Mask Goggles, fitted genuine Tinted Triplex Lenses, 14s. 6d.; Ditto, fitted Tinted Triplex, 12s. 6d.; Meyrowitz Luxor Goggles, fitted Triplex unsplinterable lenses, 40s.; R.A.F. Scarf, 5s. 6d.; Pilot's Gauntlets, 12s. 6d. per pair; Suede Golf Jacket, best quality, ideal for flying, 50s. We are contractors to Foreign and Colonial Governments. S. Lewis's, 19 and 27, Carburton Street, London, W.1.

No Connection with any other Firm.

Wainwright's Flying Equipment.—Wainwright Flying Helmet (passed by A.M.) lined chamois, 22s. 6d., in Black or Tan, Fur trimmed helmets 12s. 6d., 15s. 6d. White helmets, pique or drill 12s. 6d. Flat type earphones, complete with connections and "Y" pieces, 12s. 6d. Flying mask goggles, clear or anti-dazzle, 12s. 6d. Genuine R.A.F. Sidcots 57s. 6d. Chrome Leather flying coats, 84s. to £8 8s. Write for catalogue Wainwright's, 300-302, Euston Road, London, N.W.1. 'Phone: Museum 6280.

Established over 30 years.

THE LEADING HOUSE FOR AVIATORS' CLOTHING.

AVIATORS' CLOTHING.

Fine quality R.A.F. pattern Chrome Leather Coats, fleece lined, 105/-, 120/-. Other styles from 77/6. Flying Suits, fitted with fur collar, all sizes, 60/-. White Flying Suits, 25/-, ditto., super quality, with zip fastener, 30/- & 35/-. Mask Goggles, fur lined, 12/6. Featherweight goggles fitted genuine Triplex, 7/6. Genuine R.A.F. Flying Gloves, with lambs wool pouch, 12/6. Flying Helmets, 12/6, 14/6. Approved Air Ministry pattern Helmet, perfect fit assured, best quality leather, chamois lined, 22/6. White Flying Helmets, etc. Genuine D.H. Phones, 12/6 Finest Sheepskin Flying Boots, lambs wool lined, zip fastener, 45/- and 63/-. Best Suede Golf Jackets, zip fastener, 57/6, 63/-.

Write for fully Illustrated Catalogue. Post Free.

All goods sent on 7 days' approval against cash or C.O.D. Money refunded if not satisfied. *We make and sell at the keenest prices.*

PRACTICAL FLYING.

A and B Licences at Reading Aerodrome.—Beautifully situated. First-class instruction. Moderate terms, accommodation.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome, 'Phone Sonning 114.

BROOKLANDS SCHOOL OF FLYING employs three pilots who have been instructing since 1916. Take advantage of their experience and let them teach you on a Moth or an Avro. Private accommodation on the aerodrome, which is only 50 minutes by rail or road from Waterloo. 'Phone: Byfleet 436-7.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth Equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—**LEARN AT LYMPNE.**

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines, Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS VACANT.

Chief Inspector required at once for Canadian Aircraft organisation. Good salary. Must be thoroughly experienced. Apply with full details to Canadian Vickers Limited, Montreal, Canada.

Draughtsman, required immediately. Capable of assisting in Stress Office. Reply, stating age, experience and salary required. Westland Aircraft Works, Yeovil.

Wanted, Aero-Engine Fitters with engine repair shop experience on Napiers. Ex-R.A.F. preferred. Box No. 5682, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Wanted immediately in London, Senior Draughtsman for Aircraft. Please apply stating all material particulars to The Monospar Co. Ltd., 4 Broad Street Place, E.C.2.

Wanted, Ground Engineer, A and C Licences, for Le Rhone Avros. Write stating salary required to Box No. 5691, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Wanted at once, two "B" Licensed pilots, experienced on boats or floats, Ex-R.A.F. Officer or Airman Pilot with civilian experience preferred. Permanent situation. Send full particulars to:—Tour and Travel Association Ltd., Airport, Woolston, Southampton.

MISCELLANEOUS.

"Chequers Inn," Slaugham, Board Resident. Golf and coarse fishing half-mile. London 35 miles. Brighton 1[illegible] miles. Proprietor.

Reward £1.—Information leading to location and purchase Curtiss OX-5 Aeroplane Motors, new or used. Apply Box No. 5687, The Aeroplane, Cannon House, Pilgrim Street E.C.4.

Charming Cottage to Let, Furnished; large living-sitting room, 3 bed-rooms, usual offices; sunny garden; fruit flowers; 4 gns. weekly.—Address Grieve, Whins, Chalfont St. Peter, Bucks.

Schneider Trophy.—Gentleman will take guests on his 113 ton yacht for the Schneider Cup at either £3 a day or by arrangement. Apply BM/A.S.S., London, W.C.1.

CROYDON TO CHINA

14,000 MILE FLIGHT IN AN AVIAN

On March 2nd of this year, Mr. Wenlin Chen left Croydon Aerodrome in an Avro Avian. On May 10th, he arrived at Amoy, China. Throughout this 14,000 mile flight across Europe and Asia no trouble was experienced, and Mr. Wenlin Chen expressed complete satisfaction with the machine. This Avro Avian is one of fourteen ordered by the Chinese Government for a school to be opened at Nanking.

AVRO AVIAN

The safest, most dependable, easiest to handle light aeroplane.
Used increasingly by flying clubs throughout the world.

ON AN IMPERIAL LESSON.

No one flight in the past has done quite so much to prove the practical possibilities of aviation in relation to the British Empire as has the flight made by Her Grace the Duchess of Bedford and her crew, Mr. C. D. Barnard and Mr. R. F. Little, to India and back. And the Empire owes a debt of gratitude to this distinguished lady for the lesson which she has taught us.

Quite a reasonable number of great flights have been made by British pilots, though unfortunately owing to lack of financial support from the wealthy people of this country, and owing to lack of Government support, caused by the economy forced upon us by our habit of paying our international debts, such flights have not been numerous in proportion to the size and importance of the British Empire.

The great pioneer flights, such as the first non-stop flight across the Atlantic, the first flight to Australia and the first flight to the Cape, showed that air communication between the different parts of the Empire was possible. Much in the same way the early flights of the Wright Brothers and of Glenn Curtiss in America showed that some day human beings would fly.

The recent non-stop flight to India was an indication of what can be done in the way of producing a long-range aircraft capable of carrying big loads efficiently, though the actual non-stop flight to India as such was just as purely a stunt as was the great Italian non-stop flight to the coast of Brazil, and did not demonstrate anything useful in itself.

The flights which have shown the practical usefulness of the aeroplane are much fewer. Of them the most important have been Mr. Bert Hinkler's lone-hand flight to Australia in 15½ days, Lieut. Bentley's flight to the Cape and back, and Lady Bailey's flight to the Cape and home round the West of Africa. These have demonstrated immediate usefulness, and we may leave out of the question flights of a more pioneering nature, such as Sir Alan Cobham's great flights, and that of the two Moths piloted by Messrs. Stack and Leete to India, in the early days of light aeroplanes.

While we have been doing so little in the way of demonstrating the every-day possibilities of aircraft our friends in Holland have been flying to and from their Eastern possessions in the Oil Islands so often as to have almost established a regular air-line. In fact they would have established an air-line but for the fact that for political resaons, not altogether dissociated one imagines from our own Imperial air-way, we stopped the Netherlanders for some months from flying over the desert to 'Iraq, although our own machines were flying over the route regularly.

Recently we have overcome, with a vast flourish of trumpets, the difficulties of flying across Persia, which difficulties might never have arisen if we had distributed a few bags of gold in the right quarters a few years ago, or alternatively had allowed Junkers machines to fly from Teheran to Baghdad.

But even now the time which our air mails take to reach Calcutta is merely grotesque, considered alongside of the average speed of the American trans-Continental mails. We have made the mistake, which ought to have been obvious from the start, of thinking that we are going to carry passengers to India in paying quantities in slow machines when with the lessons of six years in America before us we ought to have concentrated on high-speed mail machines. That is the worst of trying to run anything with a board of directors instead of letting one man have a free hand,—as Colonel Paul Henderson had in the States.

Now the Duchess of Bedford has come along and completely taken all the shine out of our Imperial air-line to India by showing that an aeroplane which is itself almost ancient history can go to India and back in only a few hours more than our precious air mail takes to get to India. Whether Her Grace the Duchess had in mind a deliberate attempt to show up our Imperial error one does not pretend to know. But at any rate she has done it very effectually.

The machine which she used was a standard Fokker cabin monoplane, built in 1925. For some time it was used on the regular K.L.M. service between Amsterdam and London. Later Mr. W. B. Leeds bought it, named it the *Princess Xenia*, and lent it to Mr. McIntosh, who in 1927 tried to fly the Atlantic from an aerodrome near Dublin, with an Irish passenger, and returned after flying over the Atlantic for about 300 miles.

Early in 1928 Mr. McIntosh and Mr. Bert Hinkler tried to fly the same machine non-stop from England to India, but after flying for more than 24 hours and penetrating somewhere over Russian territory, they were forced to return and land in Poland.

After this the machine passed under the control of the Duchess of Bedford, who in June 1928 employed Mr. C. D. Barnard and Mr. A. H. Alliott to try to fly to India and back. At that time the machine had an ungeared Jupiter engine.

After flying to Bushire in three days some part of the engine blew up or blew in, owing to the supply of unsuitable fuel at one of the stopping points. The machine was then shipped to Karachi, where a new engine was fitted. Mr. Barnard and Mr. Alliott flew back from Karachi in just under five days, and the Duchess of Bedford came home by boat.

For the flight which has just been done the old Fokker, now renamed *The Spider*, was fitted with a geared Jupiter engine Mark VIII. The success of the flight proves definitely that the geared Jupiter engine is as reliable as the well-proved ungeared type,—which is to say that it is as good as the World's best.

HOME AGAIN.—The return of the Duchess of Bedford to Croydon after having been to India and back in seven-and-a-half days.

Digitized by Google

To give credit where it is due, the gasolene used was supplied by the British Petroleum Co. Ltd. (which is Anglo-Persian), the lubricating oil was that of C. C. Wakefield and Co. Ltd., and the plugs were K.L.G.s.

The time-table of the flight is as follows:—

Friday, August 2, left Lympne 5 a.m., arrived Sofia in the evening (1,350 miles).

Saturday, August 3, left Sofia, arrived Aleppo, Syria (850 miles).

Sunday, August 4, left Aleppo, arrived Bushire, Persia (1,090 miles).

Monday, August 5, left Bushire, and arrived at Karachi at 6.55 p.m. (1,060 miles).

Tuesday, August 6, left Karachi 6.30 a.m., arrived Bushire.

Wednesday, August 7, left Bushire for Aleppo.

Thursday, August 8, left Aleppo, and arrived at Sofia.

Friday, August 9, left Sofia at 4.20 a.m., reached Croydon Aerodrome at 5.30 p.m.

Primarily this successful flight is entirely due to the energy and initiative of the Duchess of Bedford, who thus adds another of the debts of gratitude which British Aviation owe to the women who have interested themselves in flying in the right way and not merely for publicity.

The Duchess of Bedford was born in September, 1865, at Stockbridge, Hants., and was the second daughter of the Venerable Archdeacon Tribe. She was educated at Cheltenham and Zurich. She married Lord Herbrand Russell, now Duke of Bedford, in 1888. Besides being addicted to fishing and shooting as sports, Her Grace is given to serious pursuits. Her specialities are natural history and radiography, and she has contributed on ornithology to Scottish papers.

Much praise is certainly due to the crew of the machine. Mr. C. D. Barnard, the pilot, was in the R.F.C. and R.A.F. during the War, and became one of the first commercial pilots soon after the War. He distinguished himself particularly by bringing down safely, with passengers, a machine which had caught fire in the air when he was joy-ride flying at Blackpool. Since then he has done a large amount of cross-country flying, practically all over Europe, mostly in the employ of the De Havilland Co. He has long been recognised as a pilot of quite the first class though he has not had the opportunity of making any historic flights.

Mr. R. F. Little was a young man who came into aviation after the War and having some money of his own tried pluckily for some time to run a joy-ride concern on the North-West Coast, at Morecambe and thereabouts. He learned to fly, but never took to piloting seriously, preferring to devote himself to the mechanical side of aviation. He first came into the public eye as one of the engineers who accompanied Mr. Frank Courtney on his attempted trans-Atlantic flight, and since then he has been closely associated with several well-known pilots. This great flight to India and back assures for him an important place in British Aviation.

Altogether the flight must always stand out in history as the finest possible demonstration of the uses of air communication within the British Empire. Admittedly the course taken was over foreign territory which might in another important war be hostile, though as a matter of fact Turkey is much more likely to be our ally than our enemy in the next war. To that extent the actual distance was shorter than any which would normally be covered by an Imperial airway based as far as possible on British possessions or mandated territory.

But the slight difference between going North of Switzerland to Sofia and thence across Turkey, and going to the South of France and straight along the Mediterranean with high-speed flying-boats is so slight that the difference between the cruising speed of a modern aeroplane and the cruising speed of this ancient Fokker monoplane, even with its thoroughly modern Jupiter engine, would more than make up the difference in time over the whole journey.

Also, be it remembered, the Duchess of Bedford's machine flew only by day, whereas anything which pretended to be an Imperial air-mail line would fly by night. Our particular air-mail route to India is peculiarly suited to night-flying because we can fly by night either along the Mediterranean, or over the desert from Palestine to 'Iraq, or down the Persian Gulf. In this we have even greater advantages than has the American trans-Continental line, which covers some of its worst country at night, and hardly ever kills a pilot, because of its perfectly organised system of landing grounds and landing lights.

When at last we do have an air-mail line to India carrying the mails in about 36 hours, as we could have perfectly well to-day if as a nation we had any initiative and energy, the credit for that line will belong first of all to Colonel Paul Henderson, who showed America six or seven years ago how to lay out an air-mail route, and secondly to Her Grace the Duchess of Bedford who, as a sportswoman, has shown our so-called business men what can be done with Imperial Communications.—C. G. G.

ON BEARING FALSE WITNESS.

So much happened in the month of July, what with the Rotterdam Meeting and the R.A.F. Pageant and the Aero Show that there has been no time or space in which to deal faithfully with an article which appeared in the July issue of *Air*,—the Official Organ of the Air League. But, in the interests of historical accuracy, one must deal with it because it is so full of misrepresentations and false statements. The article bears the title "The Outlook,"—And a Case for Inquiry." It is signed by Brigadier-General P. R. C. Groves, C.B., C.M.G., D.S.O., Honorary Secretary-General, Air League of the British Empire, and it is apparently his swan song on abandoning his grandiose title. As usual, it consists of an attack on those who have been responsible for the re-building of the Air Force since it was cut down in the interests of national economy at the end of the War 1914-18. Also it contains certain statements about The Aeroplane newspaper which are entirely untrue. To a certain extent it is an attempted answer to the article on Brig.-Gen. Groves and his mismanagement of the Air League which appeared in The Aeroplane of June 12.

Most of it is so weak as not to deserve a reply. But in his counter-attack Brig.-Gen. Groves makes statements which, if they were true, might be to a certain extent damaging to the Air Ministry, though they would from one point of view give people the idea that The Aeroplane is in even a stronger position than it is in fact.

Like the last article which Brig.-Gen. Groves wrote in *Air* attacking the Air Ministry, this article also takes the form of an address to Lord Thomson, the present Secretary of State for Air, upon whom Brig.-Gen. Groves calls to investigate personally what would be, if Brig.-Gen. Groves's allegations were true, a gross public scandal.

AUTO-GIRING.—The latest Autogiro, with Armstrong Siddeley Genet. This type blows its windmill round by deflecting the slipstream with its tail-plane, and so shortens by minutes its time in leaving the ground.

EVERY Napier engine produced can be depended upon.

No other engine in the World has such a record of consistent reliability and efficiency.

These qualities are the results of excellent design, combined with extreme care in manufacture, whilst a rigid system of inspection ensures that the high standard laid down is always maintained.

The following achievements prove the high performance of the Napier:—

THE FIRST NON-STOP FLIGHT FROM ENGLAND TO INDIA was accomplished by a Royal Air Force Fairey monoplane fitted with **NAPIER** engine —**4,130** miles in 50 hours 38 minutes.

THE FIRST FORMATION FLIGHT FROM ENGLAND TO AUSTRALIA was achieved by four Royal Air Force Supermarine "Southampton" flying boats each fitted with two **NAPIER** engines—**180,800** engine miles without mechanical trouble.

THE HIGHEST SPEED IN THE AIR was accomplished by Flight-Lieut. D. D'Arcy Greig with a Supermarine seaplane with **NAPIER** engine—speed **319½** m.p.h.

THE HIGHEST SPEED ON LAND was set up by Major Sir Henry Segrave on his Irving-Napier special with **NAPIER** engine.

Captain Malcolm Campbell set up world's land speed records for 5 miles and 5 kilometres with his Napier engined car.

The Napier engine will give you *real* service

The Subsidy Charge.

After lamenting that what he conceives to be the work of the Air League is hampered by the opposition of what he calls the "Old Guard" of the senior Services "and the opposition of a deeply entrenched clique in the Air Ministry itself" which, he alleges, has bitterly opposed the League's efforts to enlighten the public, he says:—

A recent example is a vituperative attack upon this journal by a contemporary, which is subsidised by the Air Ministry to the extent of being distributed at public expense to the Royal Air Force. In an abusive article this tool of the *clique* referred to, challenges our statement in the last issue of *Air* that this country has sunk from being the second Air Power to the position of fifth during Sir Samuel Hoare's tenure of office.....

Hitherto we have ignored the attacks of our contemporary for two reasons: Firstly, because, as in the present instance, their venom has been neutralised by their obvious bias and spleen and by their equally obvious display of childish, almost laughable, jealousy of *Air*. Secondly, because we felt that it would be useless, so long as the late Administration was in office, to draw attention to what is really a public scandal, namely, that the journal in question is officially subsidised.

The Air League is by no means the only recipient of poisoned bouquets from this yellow press flunkey of the *clique* we have mentioned. These floral offerings have been showered at one time or another upon every great daily newspaper which has presumed to criticise the air policy pursued. We noticed in recent numbers derogatory remarks about *The Daily Telegraph, The Manchester Guardian* and the Rothermere Press. For this latter, which has done more for British aviation than any other section of the Press, our contemporary has always reserved its choicest store of invective.

The reason, of course, is that Lord Rothermere, when he was Air Minister, took a course of action which was highly distasteful to a departmental Bismarck, still in the Air Ministry, whom our contemporary regards as its *fidus Achates*. Subsequent events, which we reviewed in our last issue, have decisively proved the soundness of Lord Rothermere's judgment. In connection with that affair it is only charitable to suppose that the disgraceful abuse subsequently rained upon Bismarck's successor (who now occupies one of the highest appointments under the Crown) was a coincidence; but, if so, it was a coincidence which would be vetoed in the realms of fiction.

It is quite clear that in abusing the Air League our contemporary is merely earning its pay with goodwill. But that is beside the point; the real issue at stake and the reason why we are now drawing attention to this matter is the principle involved. *Has any department or section of a department the right to subsidise a periodical out of public funds?*

That is a question which clearly concerns the new Air Minister. We have raised it in the public interest, and we venture to suggest that it calls for Lord Thomson's personal investigation, particularly in view of the obvious fact that official subsidy of a publication implies endorsement both of its policy and of its contents—even when the latter comprise catchpenny scurrility, deliberate misrepresentation, and venomous innuendo.

The Truth, the Whole Truth.

If The Aeroplane or any other newspaper were subsidised by the Air Ministry, or by any Government department, the editor of such a paper would necessarily find his hands tied in the free expression of opinion. And no regular reader of The Aeroplane will ever charge this paper with lack of freedom in this direction.

Readers will notice that Brig.-Gen. Groves, having said just once that this journal is subsidised "to the extent of being distributed at public expense to the Royal Air Force," afterwards refers to it as being "officially subsidised." Then he calls it a flunkey of the clique. Then he writes of it as "earning its pay with good will." And finally, he says "Official subsidy of a publication implies endorsement both of its policy and its contents.'

Now, if The Aeroplane were subsidised by the Air Ministry, obviously it would be in an immensely strong position in its relations with the Aircraft Industry, for the Aircraft Industry—until this sudden growth of Civil Aviation within the last twelve months—has depended entirely on the Air Ministry for its livelihood, and so would see the wisdom of itself subsidising The Aeroplane heavily in the form of advertisements.

Unfortunately, from this particular point of view, The Aeroplane does *not* happen to be subsidised by the Air Ministry, and the Trade knows it. So what support this paper gets from the Trade is due entirely to the fact that the Trade knows very well that everybody in the Air Force, officers and airmen alike, read The Aeroplane because it has been devoted to the interests of the Flying Services through thick and thin ever since Service flying and The Aeroplane began, practically simultaneously, more than eighteen years ago.

To this extent The Aeroplane is the Unofficial Organ of the Royal Air Force. And because it has devoted itself to the interests of the people who do the flying and not to any clique, either political or Service, The Aeroplane can claim to have quite considerable influence in the Royal Air Force.

But to say that The Aeroplane is subsidised would be untrue, even if it were "distributed at public expense to the Royal Air Force," as Brig.-Gen. Groves says,—which it is not. The Aeroplane, like almost every other paper, loses money on every copy it sells, simply because each copy costs more in paper and printing than the price for which it is sold. Newspapers, as Brig.-Gen. Groves ought to know, as Editor of *Air*, exist on their advertisement revenue.

That, however, is merely by the way. The essential fact is that The Aeroplane is *not* distributed at public expense to the Royal Air Force.

A Matter of History.

Some ten years or so ago the Air Ministry issued to all R.A.F. units a list of approved technical publications which those units were allowed to buy for themselves, with permission to charge them up to the Air Ministry. That is to say, they were not to be bought out of Mess funds but with Air Ministry money. These included various engineering papers, electrical papers, and aeronautical papers, of which The Aeroplane was one.

A few years later there arose a violent controversy between the Admiralty and the Air Ministry because the Admiralty tried to cut the Fleet Air Arm adrift from the Air Ministry and to re-establish in effect the old Royal Naval Air Service. If such a thing had happened at that time the Royal Air Force would have been considerably weakened and the end would have been the break-up of the Air Ministry and the splitting up of the Air Force between the Navy and the Army. Then our Flying Services would have become mere auxiliary services to the Navy and Army under the Old Guard of each Service, and incapable of independent air action or development.

The Aeroplane at that time said several rather rude things about the way in which the Navy had mismanaged naval aviation during the War. Consequently the Admiralty took such a dislike to The Aeroplane that official representations were made to the Air Ministry—from Minister to Minister, as it were,—protesting against public money being spent by the Air Ministry on a paper which thus abused another Government department and the Service it administered.

The result was that the Air Ministry very sensibly, by way of proving definitely that it did *not* endorse the policy and contents of The Aeroplane, removed The Aeroplane from the officially approved list. And so what Brig.-Gen. Groves is pleased to call the subsidy to The Aeroplane ceased.

One has no idea how many units of the R.A.F. did in fact buy The Aeroplane out of public funds at that period. In fact one neither knew nor cared at the time. But one was, even before then, very much concerned that every R.A.F. unit should have The Aeroplane regularly. And, knowing the careless ways of Mess Secretaries and such people, one assured the delivery of The Aeroplane to all R.A.F. units by the very simple process of putting them all on the Free List of The Aeroplane. The result has been that for many years, and until quite recently, The Aeroplane has been a free issue to all R.A.F. units. But *not* at the Government's expense

Brig.-Gen. Groves will assuredly be sorry to hear that so far from The Aeroplane being subsidised by the Air Ministry, the Air Force has in fact been subsidised by The Aeroplane to the extent of twice as many copies per week as there were units in the R.A.F. at any given time during the past ten years or so,—for one copy was sent to the Officers' Mess and one to the Sergeants' Mess.

One may add, and one's pride will be forgiven, that this subsidy began at a time when The Aeroplane was losing money heavily during the post-War slump and continued through all the years when it was making no profit, until a year or so ago when the financial balance of The Aeroplane began to trickle onto the right side.

Mixed Motives.

All motives in this World are mixed, and the Directors of The Aeroplane sanctioned this subsidy for various reasons. Partly it was given because of a genuine belief in and affection for the Royal Air Force. Partly the papers were sent to assure that the British aircraft constructors who advertised in The Aeroplane had their advertisements put directly in front of the users of their products, namely the flying officers and mechanics of the Air Force. And partly the Directors took the long view that by accustoming the personnel of the Air Force to reading The Aeroplane they would build up a permanent circulation among the people from whom would ultimately spread what Sir Samuel Hoare has called the airmindedness of the Empire.

FAIREY AIRCRAFT

THE FAIREY AVIATION COMPANY, LTD., HAYES, MIDDLESEX

Digitized by Google

A year or so ago, as the amount of paper and printing in The Aeroplane each week had grown to such an extent that the cost of all these free copies mounted to quite a considerable sum, and as by that time the Air Force had become accustomed to reading The Aeroplane, a letter was sent round to the recipients of free copies suggesting that they had been sent free of charge for so many years that the various units might now consider the matter of becoming ordinary subscribers, out of Mess funds,—which are not Government money but the personal affair of the people in the various units.

The result is that practically all these units are now ordinary subscribers. So The Aeroplane has ceased to subsidise the Air Force. And the Air Force does not subsidise The Aeroplane

When a Subsidy is Not.

However, if Brig.-Gen. Groves insists that the buying of a newspaper out of Government funds does constitute subsidising that paper one is prepared to admit that The Aeroplane is subsidised by the Air Ministry to the extent of seven shillings and sixpence per week.

Apparently certain departments in the Air Ministry find that they must have copies of The Aeroplane in the ordinary course of their official work. And therefore, so far as one can gather from the books of the Publishing Department of The Aeroplane, fifteen copies of The Aeroplane are bought each week by the Air Ministry.

Certainly the Military Intelligence Department at the War Office, and probably the Intelligence Department at the Admiralty and the Intelligence Department at the Air Ministry, buy copies of *The Daily Herald* and of all the Communist publications as well, so as to keep themselves informed on certain political aspects of Service work. But even Brig.-Gen. Groves would scarcely claim that buying those papers implies an official endorsement of their policy and contents. And so he can scarcely argue that the Air Ministry by buying fifteen copies of The Aeroplane for the sake of the information contained therein endorses its policy.

Probably where poor Brig.-Gen. Groves let himself down so badly was that he learned from some young and disgruntled officer in the Air Force some years ago that The Aeroplane was a free issue to R.A.F. units, and with his usual lack of intelligence jumped to the conclusion that it was a free issue by the Air Ministry, because neither he nor his informant knew that in fact it was a free issue by The Aeroplane itself.

A Personal Matter.

Brig.-Gen. Groves' reference to "A departmental Bismarck" ought perhaps to be passed over without comment, as it is no affair of The Aeroplane's. But one cannot do so because of his reference to that other officer whom he calls Bismarck's successor

Considering that the great Bismarck was the greatest statesman Germany ever had, the epithet is certainly no insult to the present Chief of the Air Staff. The successor to whom Brig.-Gen. Groves refers is obviously Sir Frederick Sykes, now Governor of Bombay. And one denies absolutely ever having referred to Sir Frederick Sykes in terms which could by any rational person be called "disgraceful abuse."

One has known Sir Frederick Sykes since he first joined the Royal Flying Corps as a cavalry major some time in 1911. One has the greatest admiration for his vision and his ability in many directions, and for his personal courage. One owes him a debt of gratitude for many kindnesses in the early days of aviation and during the War.

When Civil Aviation came into being Sir Frederick Sykes was made Controller-General of Civil Aviation, and later he became a Member of Parliament. Unfortunately one felt obliged to disagree from his policy and from certain of his actions, and one criticised those actions just as one would criticise those of any other public servant or politician,—in spite of one's personal regard for him. But never at any time did those criticisms approach abuse of any kind. One mentions this purely as an example of Brig.-Gen. Groves' habit of bearing false witness.

Why Be Jealous?

Lastly, so far as The Aeroplane is concerned, readers are asked to refer to Brig.-Gen. Groves' curious assumption that The Aeroplane is jealous of *Air*. So far from being jealous of the Air League's publication one asks for nothing better than the chance of working hand in hand with it and with the Air League. But one cannot do this so long as Brig.-Gen. Groves is allowed to use the Air League and *Air* as tools for his ridiculous policy and for his personal animosities. Over and over again one has said that the Air League ought to be what the Navy League used to be. And if the Air League were run by the proper people The Aeroplane would be its heartiest supporter.

Air ought to do very necessary work which The Aeroplane cannot and never will pretend to do. It ought to be the great organ for popularising aviation among the masses, whereas The Aeroplane is concerned with the technicalities and the higher politics of aviation.

Air, if properly conducted, would deserve the support of the Aircraft Industry just as much as does The Aeroplane and its excellent contemporary *Flight*, whose Editor, Mr. Stanley Spooner, deserves high honour for the years of work which he has given to the cause of British Aviation, when he might have been making big money out of the motor-mongering trade.

"Air" and the Trade.

The Trade does not support *Air* openly for reasons which one considers to be quite misguided. One gathers that the Trade collectively, or possibly the Council of the Air League, are afraid that if aircraft advertisements were to appear in *Air* the Pacifists and Communists and the Socialists would raise an outcry that the Air League is not what it pretends to be, a purely patriotic non-political organisation, but that it is subsidised by manufacturers of armament in their own interests. They seem to be afraid lest the Pacifists should say that it is an organisation formed to work up a war in the interests of the armament firms, and that it is not a patriotic defensive organisation.

This policy strikes one as merely silly. Obviously a patriotic organisation which preaches self-defence by strength of arms deserves to be openly supported by armament manufacturers, and by all manufacturers, as well as by everybody else who has anything, even if only personal liberty to lose. But anyhow, certain members of the Trade, who, quite apart from business interests and merely as patriotic Englishmen, believe in the possibilities of the Air League, have in fact been subsidising it on the quiet.

Some years ago, when the activities and the finances of the Air League were at a very low ebb, one of the minor personalities of the Trade, not himself a manufacturer, went round to practically every manufacturer of aircraft, engines, accessories and material asking each one to support the Air League either with a donation, or in the last resort by becoming a subscriber to the Air League's Bulletin. Quite a goodly sum was raised,—the amount was, according to common gossip at the time, about £4,000.

Whatever was the exact sum, it was placed in the hands of a prominent member of the Trade, who, without owning up that it was a donation from the Trade, offered it to the Air League with the sole proviso that a real live hard-working competent Organising Secretary should be appointed, with his approval, to use the money to the best advantage in spreading the Gospel of Aviation. Various people were suggested as possible secretaries, and ultimately the particular gentleman in the Trade to whose care the money had been committed fixed on Brig.-Gen. Groves.

The natural assumption is that, obeying the commercial instinct which bade him try to get something for nothing, he was strongly influenced by the fact that Brig.-Gen. Groves is a man of considerable means and offered to do the job without payment. Hence the title Honorary Secretary-General.

The result has been too painfully evident,—as so often happens after getting something for nothing. Instead of the Air League backing up the Air Ministry, which is still the best customer of the aircraft constructors, the Honorary Secretary-General let loose a campaign against everything that was done by the Secretary of State for Air and the Air Staff. Instead of upholding their hands as the hands of Moses were upheld in the Wilderness he did everything that he could to undermine their authority and to create dissatisfaction, in a way which would have been harmful to the discipline and moral of the Royal Air Force if any of the Service people had taken him seriously.

If, according to Brig.-Gen. Groves' own ideas, subsidising a publication implies endorsement both of its policy and its contents, then the Air Ministry has very good reason for getting its own back off the Trade at the first available opportunity. One can only plead with the Air Ministry that, in the words of the Scriptures, the Air Ministry may forgive them for they knew not what they did. And one would counsel the Trade that if they wish again to help the Air League to turn over a new leaf they see to it that somebody else shall handle the page.

The Political Attack.

So much for the matter of subsidies. The rest of Brig.-Gen. Groves' counter-attack consists of quite a feeble effort to refute the recent article in The Aeroplane by quoting isolated passages from speeches by Sir Samuel Hoare and Sir Philip Sassoon, on the good old principle of *lucus a non lucendo*.

This well-worked Latin tag has been called the last word in unscientific etymology. It probably originated as a joke by some Roman schoolmaster. Literally it may be translated "a grove (is so called) from not shining." In other words the word *lucus*, meaning a grove, was so called because it excludes the light.

Pluralise your grove and he still does not shine,—particularly when he tries to wriggle out of the charges of prejudice and inaccuracy and ignorance which one was com-

pelled, in the interests of justice to the late air administration, to bring against him in THE AEROPLANE of June 12.

In that article, pointing out how entirely unjustified were his attacks on Sir Samuel Hoare and his advisors at the Air Ministry, certain absurd and elementary blunders of this self-appointed air expert were exposed. In his attempted answer he tries to fog the issue in a series of long-winded paragraphs which deal with one point alone and carefully ignore all his own mis-statements to which attention was drawn in THE AEROPLANE.

Probably the readers of THE AEROPLANE are as tired of Brig.-Gen. Groves as are the General Public, so one need only say that anyone who studies the speech of Sir Philip Sassoon in Hansard of May 7 as a whole, without concentrating on the isolated sentence quoted by General Groves (the gravamen of this charge is its isolation) will see that when our late Under-Secretary of State for Air said that we had sunk to the position of the Fifth Air Power he was simply comparing the number of first-line machines maintained by the various Powers, while expressly avoiding any suggestion that this was the true measure of relative air strengths.

Sir Philip Sassoon, in fact, later in his speech, developed just the line which was taken in THE AEROPLANE of June 12. He specifically pointed out, referring to what he said about first-line strengths that "man for man and machine for machine our Air Force can more than stand comparison with the air forces of any other country in the world." With his intimate knowledge of the R.A.F., Sir Philip Sassoon would be the last person in the world to think of reckoning our position in terms of first-line strength, and working up a scare on that basis without the qualification that he was so careful to make.

FIGHTING POWER.

Naturally THE AEROPLANE holds strongly that our numerical strength should be brought up to that of other Powers as soon as possible. But let us set about this task in a reasonable spirit, strengthening the hands of those at the Air Ministry, and not trying to engineer a panic by quoting figures which are either misleading or actually erroneous,—which is what the Air League has too often been led into doing by their so-called expert advisors, and in particular Brig.-Gen. Groves.

At this point comment is worth while on the curious ignorance which assumes that in writing of fighting power,—meaning of course combatant strength,—one was alluding to numerical strength in the type of aircraft known as fighters. Such misconception might be understandable in a member of the outside public, but such confusion of thought is at least odd in one who claims even a superficial knowledge of the Royal Air Force. The only reasonable assumption is that the misunderstanding is purposeful, so as to drag a red herring across the trail and start a discussion on the relative value of offensive versus defensive aircraft.

ENTANGLING FIGURES.

In his latest effusion Brig.-Gen. Groves proceeds with more than his usual caution, and avoids as far as possible quoting any of those figures which so invariably trip him up.

The only outstanding figure which he mentions is the £3,000,000 by which, he alleges, Lord Thomson was instrumental in increasing the Air Estimates. He tells us that this sum "was allotted for the construction of airships.' And, as usual, our expert Brig.-Gen. Groves has gone completely off the rails.

Firstly, coming into office so late in the financial year Lord Thomson naturally took over Sir Samuel Hoare's estimates virtually without change. Probably with the modifications of airship policy which Lord Thomson introduced there was a slight reduction on his predecessor's sketch figures, which may have been partly made good afterwards by the supplementary vote for airships.

Therefore, the credit for the increase in the Air Estimates of 1924 belongs directly to Sir Samuel Hoare. And thus Brig.-Gen. Groves's criticism of the late administration is shown once more to be grossly unfair and misleading.

Nevertheless we must all agree that Lord Thomson does deserve the nation's gratitude for having retained his predecessor's estimates instead of trying to reduce them wholesale,—as political considerations might well have tempted him to do. His sane and balanced outlook of 1924 gives us indeed high hopes of what his present administration may achieve.

In the second place, so far from £3,000,000 having been allotted for the construction of airships in 1924, as Brig.-Gen. Groves states, the total expenditure on airships has not even yet, so far as one can gather, reached the figure of £2,000,000, although five years have now passed since those estimates were introduced. Could ignorance and inaccuracy go further?

RECIPROCITY.

Finally one would remind General Groves of the old proverb that what is sauce to the goose is sauce to the gander.

He seems to claim the utmost liberty to criticise in unmeasured terms and by offensive personal attacks the late political air administration and the present air staff, both of which will go down to history as having achieved admirable constructive work and that under great difficulties.—basing his criticism moreover on elementary errors and definite misstatements of fact.

When however those misstatements are bluntly exposed and denied, he is shocked and sanctimoniously horrified that anyone should presume to criticise the Honorary Secretary-General of the Air League, who, during his tenure of that office, has not scrupled to give vent to his individual spleen, and to indulge a wholly imaginary personal grievance in a way which has done much harm to real air development, both Service and Civil, in this country.

Unfortunately, in the grove's subfusc obscurity not everyone can separate the wheat from the chaff and understand that even if the Honorary Secretary-General of the Air League has made himself a laughing-stock in the eyes of all thinking and fair-minded people, it does not follow that all those connected with the Air League are necessarily afflicted either with the same spite against the Air Ministry, or with the same over-weening egoism.

The Air League has certainly many capable and disinterested and honest supporters. The trouble is that their voices have been swamped by the malevolent persistence of a single individual with a grotesquely exaggerated idea of his own importance.

His attack ends with the announcement of his resignation from the post of Honorary Secretary-General. Apparently he intends to remain a Vice-President of the Air League. But as such let him enfold himself once more in the obscurity of his grove—*lucus a non lucendo*.—C. G. G.

THE SCHNEIDER TROPHY CONTEST.

The Aero Club de France has officially intimated that the French team has been withdrawn from the Schneider Trophy Contest. The announcement states that although the machines and engines have been built, they will not be ready in time to give the pilots adequate training.

The Times correspondent in New York in a message dated Aug. 11 states:—

The propeller of the Mercury racing seaplane which Lieut. Alford Williams hopes to enter in the Schneider Cup race, was slightly damaged on Friday during its preliminary trials. It was sent immediately to the naval air station at Anacostia for repairs, and it is hoped that tests will be resumed to-morrow. Lieut. Williams, who is trying his seaplane at Annapolis, said that he is taking the greatest care in guarding against accidents, as he realises that he is using high-speed engines of a type unknown in this country, and it would be extremely easy for the machine to get out of control. Nevertheless, he is confident that the new aeroplane can exceed the speed of 318 miles an hour achieved by Major de Bernardi.

The Italian team are expected to arrive at Calshot on Aug. 25. The pilots will be selected from Lieut.-Col. Mario Bernasconi, Capt. Guiseppe Motta, Lieut. Giovanni Monti, Lieut. Remo Cadringher, Warrant Officer Tomasco Dal Molin, Serjeant-Major Francesco Agello, and Serjeant-Major Dio Gorri.

THE RAILWAYS' ROAD TO PROSPERITY.

The following letter contains an idea which ought to be of value to Aviation and the Railways alike:—

Sir,—One views with serious misgivings the downhill trend of railways from a financial point of view. It seems to me that railways in the near future have potential advantages that will mean a great deal from a monetary point of view to them in a short time.

The point I have in mind is the fact that railways have in the big acreage covered by their stations, places like King's Cross, Euston, Victoria, etc., large open spaces which, if covered over with great landing stages, could be made centres for the arrival and departure of aircraft. These are in fact the only open spaces big enough for the purpose left in London.

There is little or no chance of any other method of flying from the centres of London. Some railways have recently taken powers to use aeroplanes and I think they have in their station areas a potential gold mine. It will be only a matter of a very few years before all the long-distance passenger traffic will be taken in aeroplanes and the stations roofed over with a flat landing stage on which aeroplanes can land and depart. (Signed) S. F. EDGE.

ROCKET PROPULSION.

The Times correspondent in Berlin reports that a Junkers W.33 single-engined seaplane was recently "rocketted" into the air.

The machine was taxied out on the Elbe and the engine throttled back; two groups of rockets, which were fixed one under each wing, were then ignited and the seaplane took off at great speed.

Further experiments are being made and it is hoped by this means to enable heavily-laden aircraft to get off easily.

THE GREEK FIGHTING SERVICES.

The Greek Government has decided to introduce a Bill to Parliament for the constitution of a Ministry of National Defence which will absorb the existing Ministries for the Army and Navy.

In the new Ministry there will be three Under-Secretaries of State, for the Army, Marine and Naval and Military Aviation.

Notes on the Design and Construction of the

SINGLE-SEATER FIGHTER.

I. GENERAL QUALITIES.

Every effort has been made in the design of the "Bristol" Bu'ldog to give the best possible conditions for the machine's primary duty—that of a day and night single-seater fighter. The pilot is seated well forward and high up, and the wings and centre sections are so arranged to give the least possible interference with the view above and below. Two types of Jupiter engine are entirely interchangeable when desired. High speeds are maintained at altitude, whilst the rate of climb and the ceiling are exceptional. The stability and controllability of the machine is excellent, and the balanced portions of the elevators and rudder are shielded and give light control loads at all flying speeds. The ailerons are of the patented "Bristol" Frise type, which minimise yawing moments when operated. On the ground, the machine is easily and comfortably manœuvred by reason of long travel oleo legs attached to the top of the fuselage, and a swivelling tail skid. Detachable fairing panels and doors have been so arranged that every mechanical portion may be readily inspected.

OUR SCHNEIDER TROPHY DEFENDERS.—I.

THE BIRTH OF A DEFENDER.—The first Supermarine Rolls-Royce S-6 coming out of the Supermarine Works for the first time.

On Aug. 12 a party representing the technical and general Press was allowed to visit Calshot Air Station to view the first of the new aircraft built to compete for the Schneider Trophy. Originally the idea was that one Supermarine Rolls-Royce S-6 and one Gloster Napier VI should be on view, but unfortunately the Gloster VI was not ready in time to reach Calshot on this date.

The party, as guests of the Supermarine Aviation Works Ltd., the Gloster Aircraft Co. Ltd., Rolls-Royce Ltd., and D. Napier and Son, Ltd., was transported from London to Southampton and from Southampton to Calshot by Southern Railway and chars-à-bancs respectively.

All the material equipment of the High Speed Flight, with the exception of the Gloster VI, was on view. A Fairey Fly-catcher (Jaguar) was in the air when we arrived, about 11.30 hrs., and the Avro Avocet (Lynx) was in one of the sheds. These two machines have been used as the initial training seaplanes of the High Speed Flight and are still used for general flying.

At the base of Calshot Castle were two Gloster IV biplanes (Napier) and at the head of the slipway alongside was the Supermarine S-5 (Napier). These machines, actually built as competitors for the 1927 Schneider Trophy contest, have acted and are still acting as the advanced training machines for the pilots of the High Speed Flight for this year's contest.

Between them the two Glosters and the S-5 have covered about 60,000 miles. This may give some idea of the amount of flying the team has been doing.

At the head of the main slipway was the Supermarine

"The DISCOVERY" TAKES A MOTH WITH HER

The famous barque, "The Discovery," which has recently set out on a voyage to the Antarctic under the leadership of Sir Douglas Mawson, F.R.S., B.E., carries with her a Gipsy Moth Seaplane. The Machine will be used for observation and photographic work, and a quickly interchangeable ski undercarriage forms part of its equipment for operation on snow. There is a wireless receiving set installed in the Moth so that her crew may be called from "The Discovery" when she is out. Her selection for operation over some of the most hazardous territory in the world is yet another instance of the utter confidence inspired by the Gipsy Moth.

A DEFENDER AFLOAT.—The first S-6 on the water for the first time.

S-6 (Rolls-Royce). This is the first of this year's competitors to be seen in public,—and a very beautiful job it is.

The S-6 is a low-wing all-metal monoplane with a Rolls-Royce "R"-type engine, specially developed for racing purposes. It is a direct descendant of the S-4 which in 1925 put up a World's Seaplane Speed Record of 226.6 m.p.h., and of the S-5, which in 1927 won the Schneider Trophy contest at 281.65 m.p.h., and in 1928 averaged 319.5 m.p.h., the fastest speed ever recorded over the official 3 km. course,—though not a World's Record as it did not beat the F.A.I. record by a big enough margin.

Compared with the Napier Lion of 1927-28 the new Rolls-Royce engine is much larger and gives considerably increased horse-power. It is a 12-cylinder 60 degree Vee engine whereas the Lion, as is well known, is a 12-cylinder "broad-arrow," or W, type with three rows of four cylinders each. The S-6 is consequently heavier than its predecessor although its overall dimensions have not been greatly increased. As the present machine is slightly larger it should be more seaworthy without losing anything of its flying qualities or manœuvrability. Moreover, the ratio of weight to horse-power of the S-6 is appreciably better than that of the S-5.

The general lines of the fuselage differ from those of the S-5 owing to the different type of engine fitted, and these lines can be seen better in the photographs than they can be described. The flat top line of the fuselage and the curved line below are noticeable.

Constructionally the machine has many novel features of which the following are the most noteworthy.

Unlike the S-5, which had wooden wings covered with plywood, over which were placed the wing radiators, the S-6 has metal wings and the radiators, which consist of two thicknesses of duralumin with water-space between, are made as a wing covering to take torsional loads. These radiators have a perfectly flat outer surface and add no resistance to the machine. This method saves a considerable amount of weight over previous practice.

The fuselage is all of metal, and the skin takes practically all the stresses. The front portion of the fuselage acts as an engine-bearer and the skin in this region takes all the engine loads.

In place of the cantilever engine-mounting used on the S-5, the front float struts have been moved forward to provide a support and a substantial saving in weight has been made in this way.

The floats are of duralumin with the exception of the middle portion, which forms the petrol tank and is of steel.

This last-mentioned feature, which was also used on the S-5, rather defeated one newspaper correspondent, who wrote of it thus.—"Among the many novel features of the racing aeroplane is the designing of the floats. Actually they will be huge tanks. In some way which cannot be explained the engineers are floating the body of the S-6 on tanks of petrol."

The oil tank is in the fin. Oil circulates from the engine to this tank through specially-constructed oil-coolers on both sides of the fuselage and is returned to the engine along external ducts on the underside of the fuselage.

ON THE PONTOON.—The first S-6 on her own floating dock.

having exceeded all previous records for sustained flight by more than a week, was functioning normally in all respects, and in good condition.

This world's record was made with equipment emblematic of the standard of

CURTISS products covering all types of civil and military aircraft and engines, that has maintained

CURTISS

the leader for more than twenty years in the design and manufacture of aeroplanes and motors.

THE CURTISS "CHALLENGER" ENGINE.

The Curtiss Aeroplane Export Corporation,
27 West 57th Street New York City

Digitized by Google

IN THE AIR.—The first S-6, photographed from Calshot Castle on Aug. 12.—(*"Aeroplane" photograph.*)

The Rolls-Royce "R" engine is a direct descendant of the "H" type but the normal output of 830 h.p. of the latter type has been considerably increased in the racing engine. This result has been achieved by, among other methods, the fitting of a special supercharger of new design.

Much has been done to reduce frontal area. The engine has been produced in the closest co-operation with the Supermarine Company and a fuselage shape has been adopted which, taking into consideration the power output of the engine, gives promise of lessening the head-resistance by a great deal, as compared with previous racing types.

The airscrews for use by the S-6 have been designed and constructed by the Fairey Aviation Co. Ltd., and also by the Supermarine Company under Fairey-Reed licence.

Special pontoons have been built to transport the seaplanes from the base at Calshot to any suitable piece of smooth water from which they can operate. These pontoons are like broad flat boats, so shaped that they tow easily, are built of steel and are 42 ft. long and about 14 ft. wide.

The bows are shaped like those of a fast launch and the remainder of the pontoon is somewhat like a floating dock, with a water-tight deck low down, and side walls.

Arranged in this open part is a steel platform running on rollers, at an angle to the water, so that, as it is rolled out beyond the stern of the boat, the platform sinks deep enough to allow the seaplane to be floated over it. When the seaplane is in position, the platform is hauled up by a winch till the machine is safely housed inside the pontoon.

The engine in the machine can be run up while it is on the pontoon, and when all is ready, the platform is run out and the seaplane is afloat with engine running ready to take off.

To withstand the thrust of the airscrew when the engine is being run up, heavy mooring gear and a powerful capstan to operate it are needed.

With the seaplane on board, the pontoon is towed to a suitable spot, the anchor is dropped, the engine in the seaplane is started again, and the machine is then put afloat. The pontoon remains at anchor ready to take the machine on board again and return it to its base.

The pontoons also carry a supply of fuel and lubricating oil, compressed air and other means of starting the engine, and all the accessories required for operating the seaplanes.

There is also a cabin in which the pilot can rest or change his clothing, and in which meals can be cooked and eaten in comfort.

When the visitors arrived Flg. Off. R. L. R. Atcherley was aloft on the practice Flycatcher. This comparatively staid aircraft—a single-seat fighter shipplane of considerable age as a type—was being handled in a manner which made one think that it had hitherto hidden its light under a bushel. With two long duralumin floats, which could not have helped it much, the machine was made to loop, roll, roll off the top of a loop, spin upwards and generally steal all the gags of the latest high-performance landplane fighters. It was a very pretty exhibition.

While the fly-catching exhibition was in progress Flg. Off. H. R. D. Waghorn took off on the Supermarine Napier S-5 and gave an emotioning exhibition of speed flying over the Supermarine Rolls-Royce S-6 and the neighbouring land and water, while the latter was having its engine run up.

In the meantime the S-6 in its resplendent Supermarine blue-and-silver finish was being submitted to examination by camera lens, movietone ear and "expert" eye. The result of this inquisition should have been fairly well broadcast by the time this appears in print.

ON THE WATER.—Sq. Ldr. Orlebar after alighting in the first S-6.

A characteristic of

LODGE

AVIATION PLUGS

is that they will withstand overheating of the engine for short periods without any detriment.

The patented construction incorporated in the Lodge A30 and A40 designs gives a wider range of resistance to heat and oil than is obtainable in any other make of plug.

PATENT 308435.

Illustration of the Lodge A40 partly sectioned to show the construction.

On A.I.D. Air Ministry Approved List.

Descriptive leaflet on request to:

LODGE PLUGS LTD., RUGBY, ENGLAND.

Digitized by Google

After a short run-up the engine was switched off and Sq. Ldr. A. H. Orlebar, the officer commanding the High Speed Flight, climbed into the cockpit, which act led to further activity of the Press photographers.

The S-6 was then walked down the slipway, hitched-up to a motor boat and towed out into the fairway.

When well out of the shipping passage on the far side of Southampton Water the motor-boat unhitched and went alongside to start up the Rolls-Royce engine. In an incredibly short time the S-6 was under way and in from 25-30 seconds it was in the air.

Sq. Ldr. Orlebar flew round for about a quarter of an hour, giving a very convincing demonstration of the machine, although he had the engine nothing like all-out.

A comparison of the difference in sound between the S-5 and S-6 was interesting. The S-5 has a scream which is quite peculiar to itself. The S-6 has a much deeper-throated roar, and both machines emit that piercing whine after they have passed. This was more pronounced with the S-5.

Both machines appeared to handle equally well in the air and are clean on the water both in taking off and alighting.

After the S-6 had alighted the visitors adjourned to a buffet lunch.

After lunch the two Gloster IV's took the air. The first machine to take-off was piloted by Flg. Off. Atcherley. Unlike the Supermarine method of being towed out to a take-off position, the Gloster biplanes were started up on the station and eased down the slipway by winch and taxied straight off their cradles.

By this time quite a smart breeze was blowing, but nevertheless the pilots showed no hesitation in taxying down and cross wind across the shipping lines and even dodging round shipping, which showed that the Gloster IV's are extremely manœuvrable on the water.

The Gloster IV's have been modified for practice purposes by having their top planes raised so as to rest on the cowling behind the central cylinder block, with splayed-out struts on either side to support a centre-section. This modification seems to have made little difference to the performance, whereas it has provided the pilots with a much better view.

THE UNKNOWN QUANTITY.—The first S-6 in the air.

A TAMED TERROR.—One of the Gloster IVs (Napi Lion) of 1927, now used as a practice craft.
("Aeroplane" photograpl

While the first Gloster IV was in the air an alien visito to wit a Vought Corsair two-seat shipboard seaplane, whic forms the aircraft equipment of the *U.S.S. Richmond*, a American light cruiser, moored above Calshot, came flyin over the station. This machine, however, showed conside ably more respect for the High Speed Flight and th Air Ministry order about flying in the vicinity of Calsh during practice, than a certain D.H. Moth (G-EBYZ), whic hovered about, almost in the literal sense of the term, ve low down immediately over the station.

The second Gloster IV, flown by Flt. Lt. Stainforth, p up one of the most spectacular exhibitions of the day. taxied away from the slipway in a lather of spray, fou itself baulked by a crowded cross-Channel steamer, na gated very skilfully round it and took-off with a very sho run. Flt. Lt. Stainforth's turns were the tightest and pr tiest of anyone's, although in saying this one is not dep ciating in any way the flying of any of the others.

There is no doubt that the High Speed Flight as a wh represent about the finest combination of pilots it is possi to find anywhere in the World.

What struck the more experienced visitors most was t way in which the practice machines, which in 1927 w treated with respect amounting almost to awe, are n handled merely as what our American friends call "c ships," which all members of the team fly impartially a familiarly. One of the Glosters has been looped and rol —after the pilot had carefully worked out its factors safety with the help of a technical officer. And all of th are thrown about in the air just as most pilots use standard single-seat fighter.

In every way the visit was most encouraging to those us who are keen on the success of our team. If only the new machines are up to the quality of the men who to fly them we need have little anxiety about our chan

SEAWORTHINESS TEST OF "ROHRBACH-ROMAR."

SEAWORTHINESS !

Seaworthiness will always be one of the most difficult conditions to be met by flying-boat constructors.

For quite a couple of years the Aircraft Industry has been unable to guarantee their Customers any reasonable figures of seaworthiness for flying-boats.

The Rohrbach Metall-Flugzeugbau G.m.b.H. was the first firm, ever since the construction of flying-boats was started by the industry all over the world, to guarantee, for the three "Rohrbach-Romar" ships then under construction seaworthiness in a sea up to force 5 (Beaufort).

On December 12th and 13th, 1928, the "Rohrbach-Romar" underwent her seaworthiness trials, under supervision and to the entire satisfaction of the "Deutsche Versuchsanstalt für Luftfahrt and Deutsche Lufthansa A.G.," who satisfied themselves of the excellent manœuvrability of the ship in rough waves.

THE ROYAL AIR FORCE.

The London Gazette.

Aug. 6.

Royal Air Force.

General Duties Branch.—Sq. Ldr. J. Everidge, M.C., is placed on the retired list (Aug. 5). Lt. J. D. Ainger, R.N., Flg. Off., R.A.F., relinquishes his temp. comn. on return to Naval duty (Sept. 7, 1928). (Substituted for the notification in the *Gazette* of Sept. 11, 1928.)

Reserve of Air Force Officers.

General Duties Branch.—The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation:—D. S. Clarke (July 17); C. Bland (July 18); F. H. Peers (July 22); G. U. Hayns (July 24). W. A. W. Fitzsimmons is granted a comn. in the Special Reserve as a Plt. Off. on probation (July 1). The following Plt. Offs. on probation are confirmed in rank:—W. H. Bigg (July 22); C. H. Carter, A. F. Fleetwood-Lawton (July 30); H. C. Usborne (July 31).

The following Flg. Offs. are promoted to the rank of Flt. Lt. (Aug. 6):—A. J. P. Hytch, W. A. Mackay, D.C.M., B. R. Millar, H. D. Davis, A.F.C., G. M. Cox, M.C.

Plt. Off. M. E. Morris of the Special Reserve is promoted to the rank of Flg. Off. (May 14); Plt. Off. B. N. H. Thornely is transferred from Class A.A. (ii) to Class C (Aug. 3); Flg. Off. L. G. A. Kirchner is transferred from Class C to Class A (July 17). The comns. of the following Plt. Offs. on probation are terminated on cessation of duty:—W. G. Eatherley (June 7); E. S. Kennedy (July 17).

Auxiliary Air Force.

General Duties Branch.—No. 600 City of London (Bomber) Squadron.—The following to be Plt. Off.:—G. W. Bennett (June 5).

No. 601 County of London (Bomber) Squadron.—The following to be Plt. Off.:—The Hon. George R. Ward (June 27).

Appointments.

Week ending Aug. 12.

General Duties Branch.—Wing Commanders J. T. Babington, D.S.O., to R.A.F. Depot, Uxbridge, 6/8. A. ap Ellis, C.B.E., to Air Ministry (C.A.S.), 27/7. A. C. Winter, O.B.E., to R.A.F. Depot, Uxbridge, 27/7. Flight Lieutenants B. K. D. Robertson, A.F.C., to H.Q., Coastal Area, 1/8. G. D. Daly, D.F.C., to No. 1 School of T.T. (Apprentices), Halton, 29/7. A. J. Warwick, to H.Q., Wessex Bombing Area, Andover, 1/8. H. A. Hamersley, M.C., to R.A.F. Base, Calshot, 1/8. F. G. Gibbons, D.F.C., to No. 5 F.T.S., Sealand, 1/8. R. A. B. Stone, to No. 1 Air Defence Group, 1/8. N. Carter, to Station H.Q., Donibristle, 1/8. C. J. Southam, to School of T.T. (Men), Manston, 1/8. W. A. Tattersall, to No. 21 Group H.Q., West Drayton, 1/8. A. E. Paish, to No. 2 F.T.S., Digby, 1/8. E. W. Broadberry, M.C., to Home Aircraft Depot, Henlow, 1/8. E. C. Dearth, to Home Aircraft Depot, Henlow, 1/8.

Flying Officers G. D. Green, to M.A.E.E., Felixstowe, 1/8. H. M. G. Parker, to A.A.E.E., Martlesham Heath, 1/8. J. H. McC. Reynolds, to M.A.E.E., Felixstowe, 1/8. D. V. Ivins and W. G. Cheshire, to Home Aircraft Depot, Henlow, 8/7. C. H. Tighe, P. S. Bloskey, H. E. Nowell, G. R. Beamish, L. W. Cannon, T. H. Carr, R. Costa and G. H. Shaw, all to Home Aircraft Depot, Henlow, 1/8.

Air Cadetships.

The following are declared by the Civil Service Commissioners to be the successful candidates at the competition held in June, 1929, for admission to the Royal Air Force College, Cranwell. Their admission is conditional on their having passed a medical examination.

The names are in order of merit:—

Oulton, W. E.; Evans, M. H. L., Diack, P. G. A.; Moriarty, D. W. R.; Drew, P. E.; Chesterman, H. W. A.; Johnstone, A. C.; Ingham, E. C.; Macnair, D. I. P.; Stainthorpe, W. W.; McIlwaine, A.; Berry, P.; Stokes, F. E.; Barnett, C. A.; Ling, C. W. M.; Macdonald, J. R.; Welch, W. P.; Turner, W. H. N.; Fawkes, E. H.; Andrews, L. V.; Brown, L. F.; Hooper, L. M.; Shearn, A. C.; Hutchinson, D. L. R.; Halliday, N. A. R.; Goring, C.; Fletcher, H. B.; Read, G. J. L.

Short Service Commissions.

The Air Ministry announces that during the next few months about 100 officers will be required by the R.A.F. for flying duties under the short service commission scheme. Applications are accordingly invited from well-educated candidates of good physique who are between the ages of 18 and 25.

Selected candidates are required to appear before the Interview and Medical Boards at the Air Ministry, London. If accepted they are granted short service commissions for five years' service on the active list and four years on the reserve.

During their period of service short service officers have opportunities and facilities for study with a view to preparing themselves for civil life and assistance is given to them in seeking employment when they pass to the reserve. A competitive examination is also held annually and from this a limited number of short service officers are appointed to specialist courses in Engineering, Wireless Telegraphy, Armament, etc., with a view to obtaining permanent commissions in the Royal Air Force. About twenty appointments to Medium Service are also offered annually to short service officers, i.e., to serve for a second period of five years on the active list. During this period, however, they are ineligible for the grant of a permanent commission.

Application forms and full details of the conditions of service can be obtained from the Secretary, Air Ministry, Kingsway, London, W.C.2.

Air Communications.

His Royal Highness the Prince of Wales flew to Berck Plage from Hendon on August 9 in a Service Moth of the Communication Flight, R.A.F., piloted by Sq. Ldr. D. S. Don. He returned to London by air on August 14. [Some surprise may be felt that the Air Ministry, which supplies the aircraft which are used by the Prince of Wales, should allow the heir to the Throne to be taken across the Channel in a low-powered single-engined aeroplane without floats or flotation gear. The risk is unduly great, and is all the greater because so far no light aeroplane has yet fallen into the Channel while following the normal course, and such an accident is bound to happen soon, now that so many light aeroplanes cross every week.—C. G. G.]

The Prime Minister flew from Leuchars to Turnhouse in a Service aeroplane on August 10 to attend a conference in Edinburgh with representatives of the Cotton Industry. After the Conference he returned to Lossiemouth by air.

THE PERSONNEL.—The High Speed Flying Section, R.A.F., at Calshot. From left to right: Flg. Off. H. R. D. Waghorn, Flg. Off. T. H. Moon, Flt. Lt. D'A. A. Greig, D.F.C., A.F.C., Sq. Ldr. A. H. Orlebar, A.F.C., Flt. Lt. G. H. Stainforth, Flg. Off. R. L. R. Atcherley.

AFLOAT.—The Supermarine Rolls-Royce S-6 on the Solent.

The Schneider Trophy Contest.

Special arrangements to enable R.A.F. personnel to watch the contest for the Schneider Trophy are contained in an Air Ministry Weekly Order, extracts from which are:—

A special car park has been reserved in the immediate vicinity of Fort Gilkicker for holders of tickets of admission to the Fort. Car badges for the park can be had from Woolfe and Lucas, Piccadilly Circus, W.1, price 10s. Officers are advised to buy the badges in advance to facilitate progress through the traffic to the car park.

There is only room for 160 cars in the free car park at Fort Monckton Hutments, half a mile from Fort Gilkicker. When this park is full cars will be parked on the R.E. Recreation Ground at a charge of 2s. 6d. per car.

Admission to the two car parks will only be granted to cars bearing the appropriate car badge. These can be had free of charge on application by C.O.s of Units for the number required, direct to the Secretary, Gilkicker Committee, No. 10 Group, R.A.F., Lee-on-Solent. All applications must arrive by Aug. 1.

Arrangements have been made for free admission without a ticket of sailors, soldiers and airmen in uniform to the golf course 1s. enclosure on the foreshore between Fort Monckton and Stokes Bay Pier. Free tickets of admission to this enclosure can also be obtained by each airman for not more than three adult friends and also for any children under 12 years of age.

Application for the total number of tickets required should be made by C.O.s of Units direct to the Secretary, Gilkicker Committee.

There will be a free park for motor-bicycles at Monckton Hutments parade ground, for which no ticket of admission is required for men in uniform.

Sundays at Calshot.

In reply to a letter from the Bishop of Portsmouth expressing fear that the noise of the machines practising for the Schneider Trophy Contest will interfere with church services, the Lord Thomson, Secretary of State for Air, has stated that practice will not take place between 10.30 hours and 12.30 hours on Sundays, and if it should be necessary to hold the contest on a Sunday it will not begin before 14.00 hours.

The London Auxiliary Squadrons.

The two London Squadrons of the Auxiliary Air Forc started their annual summer training on August 3.

No. 600 (City of London) (Bomber) Squadron is trainin at Tangmere, Sussex, this year, the station of No. 1 (Fighte Squadron and No. 43 (Fighter) Squadron of the Regular A Force.

The City of London Squadron is under the command c Sq. Ldr. the Right Hon. F. E. Guest, C.B.E., D.S.O., and i strength in camp is nineteen officers and 101 other rank The Squadron is co-operating with the Regular Squadron and the general experience of all ranks is being increase by visits to the camp of machines from various units.

No. 601 (County of London) (Bomber) Squadron is trai ing at Lympne, Kent, and, in the absence of the Lo Edward Grosvenor, who is still on the sick list, is under th command of the Adjutant, Flt. Lt. Thornton, R.A.F. The are twenty-one officers in camp and 110 other ranks. Th Squadron is co-operating with Units of the Regular A Force, and is doing its practice bombing and wireless con munications at Eastchurch.

Both the London Squadrons, in common with the rest the Auxiliary Air Force, are still equipped with Avro Trai ing machines and with D.H. 9as, but the latter are short to be replaced by Westland Wapitis.

Forging the Links.

An officer of the R.A.F. arrived at Rangoon on Aug. 2 complete the arrangements for landing grounds at Mou mein, Tavoy, Victoria Point, and possibly at Mergui a Bassein, in connection with the establishment of an a service between Rangoon and Singapore, one of the air lin on the ultimate Imperial route to Australia.

The aerodrome at Rangoon will probably be complet next March.

ARMSTRONG SIDDELEY ENGINES

Hendon and Olympia

FIRST the R.A.F. Display and then the Aero Exhibition disclosed the dominating position of Armstrong Siddeley aero engines. At these important events Armstrong Siddeley aero engines easily outnumbered other types, being widely fitted in fighting, training, civil, naval and military aircraft of all kinds.

The remarkable popularity of the Armstrong Siddeley engine is due to the excellent service it gives under the severest conditions and to the complete range of standardised engines offered.

In the Armstrong Siddeley range from 80 h.p. to 800 h.p. there is an engine of proved quality, endurance and performance to meet your particular requirements.

Full details in four languages sent by return of post.

The Value of Standardisation

BY varying the number of cylinders the Armstrong Siddeley Jaguar, Lynx, and Mongoose engines cover a wide field of applications with a high degree of standardisation and interchangeability of parts. The parts marked with a cross are interchangeable on the Jaguar and Lynx, the other parts being interchangeable on all three engines. The varied uses of these engines are shown by the illustrations of aircraft in which they are fitted.

The R.A.F. Display.

An interesting account and criticism of the R.A.F. Display appears in the August 3 issue of the American publication *Aviation*. The writer is Mr. Earl D. Osborn, Contributing Editor of *Aviation*, and recently the proprietor of that paper. He saw much War service in France, from 1915 to 1919, and has learned to fly since the War.

Extracts from the article read thus:—

Our shows are national merely in the sense that they attract fliers and men of the industry from all over the country. The R.A.F. Pageant is national in the sense that it is intimately tied up with national policies and national defense.

The program itself was excellent, giving the detail of what was to be done and why, a brief description of the equipment to be used and the personnel that was to fly it. The crowd was held back from the field by a low picket fence, and the rule that no one was allowed beyond the fence was strictly adhered to. There were no groups of pilots, officials and friends conspicuously blocking people's views. In short, the whole of the arrangements for the handling, placing, and comfort of the visitors was excellently done.

As the field is not a very large one it took good flying to bring in a formation and get it out of the way for the next event. Many English claim that our service squadrons have better planes than theirs, but there is no doubt that the R.A.F. as a fighting force is a machine of tremendous efficiency.

Probably the most impressive aspect of the Pageant was the absolute perfection of its operation. Those who have been in the flying game realise how easy it is not to start on time, but at the Pageant every event was begun exactly on schedule.

Frankly we are a little disappointed in the flying. It did not seem either individually or collectively as good as the show that the Navy staged at Los Angeles last fall. Team-work and discipline were perhaps more evident and it may have had a more practical aspect, but from the spectacular standpoint it was not up to Los Angeles. It is, of course, impossible to judge accurately by eye, but the majority of the pursuit planes did not seem to have the performance of ours either in climb or speed. Many seemed to be able to turn on a shorter radius than ours, but this again is hard to judge.

The Electrical and Wireless School.

The Headquarters of the Electrical and Wireless School closed at Flowerdown at 17.00 hours on Aug. 6, 1929, and re-opened at Cranwell at 10.00 hours on Aug. 7, 1929.

A care-and-maintenance party will remain at Flowerdown until the Station is finally closed.

Manston.

A Station Headquarters was formed at Manston as from July 1, 1929.

H.M.S. "Glorious."

Capt. D. F. Moir, D.S.O., R.N., was appointed on Aug. 7 to the command of the new aircraft-carrier *Glorious*, which is now completing at Devonport. H.M.S. *Glorious* is due to be finished in February, 1930, when she will join the Mediterranean Fleet.

A No. 27 Squadron Reunion.

A former member of No. 27 (Bomber) Squadron, R.A.F., is anxious to arrange a reunion of those who served with the Squadron in India. No definite arrangements have been made at present, but those interested are invited to write to Cpl. H. Adams, No. 1 Section, R.A.F., M.T. Depot, Harlescott, Shrewsbury.

Inter-Services Lawn Tennis.

The Inter-Services Lawn Tennis Championships were held at Wimbledon on Aug. 5 and 6. The Royal Navy won the Championship by beating the Army by one set. The final totals were:—R.N. 9 matches, 19 sets; Army 9 matches, 18 sets; R.A.F. no matches.

The R.A.F. team were:—

SINGLES.—No. 1, Wing Cdr. H. J. F. Hunter; No. 2, Wing Cdr. R. E. Saul; No. 3, Flg. Off. R. E. Hall.

DOUBLES.—No. 1, Hunter and Saul; No. 2, Hall and Flt. Lt. J. Dumny; No. 3, Flt. Lt. E. D. H. Davies and Flt. Lt. C. J. Williamson-Jones.

The R.A.F. Swimming Association.

The following officer has taken over the duties of Acting Hon. Secretary, R.A.F. Swimming Association, from Aug. 8, 1929: Flt. Lt. N. Keeble, D.S.C., D.F.C., R.A.F. Depot, Uxbridge, Middlesex.

A Service Contemporary.

The Planesman, a monthly journal for the Royal Air Force, gives all the latest news from R.A.F. Stations at home and abroad. It also gives comprehensive accounts of sports and athletics and has illustrated articles of topical and general interest. It only costs 6d. a month, and those officers and airmen of the R.A.F. who cannot buy it in their Unit should apply to the Editor, *The Planesman*, R.A.F., Eastchurch, Kent.

TWO NEW BOOKS.

The Air Annual of the British Empire. Sq. Ldr. C. G. Burge. li+734 pp., copiously illustrated. Gale and Polden. From THE AEROPLANE Book Department, Cannon House, Pilgrim Street, E.C.4. 21s. net.

This is the first issue of a reference book which will receive a generous welcome, first, because such a work is needed, and secondly, because the author has discharged his task with marked ability.

All the World's Aircraft deals, as its title indicates, with the aeronautical activities of the World in general, but, owing to the general scheme and intention of that work it does not deal with certain of the particular activities of the British Empire, as does this new annual. Herein lay Sq. Ldr. Burge's chance and right well has he seized it.

We all know that "a new broom sweeps clean" and that the first of a series is often the best. But in its present hands there need be no fear for the future for this book. Its conception is rightly not parochial but Imperial, and the author has succeeded in gaining the services of contributors who have a knowledge of the subject, and are not, let us be truly thankful, "air experts." We can only hope that in the future these will not manage to get their claws or pens into the pages. The author might have been wiser to have omitted his "messages" and "foreword"—a bad book is not improved by such matter and a good one does not need them.

The sections dealing with the Royal Air Force are most interesting, but surely the operational activities of the Service during 1928 deserved more than fifteen lines. If the *R.U.S.I. Journal* can devote considerable space to these each quarter this Annual should be able to do so.

The various technical sections are good and have not wrecked themselves as so many similar articles do—by being mere catalogues and laudations of manufacturers' products. They deal with such varied subjects—airships, insurance, photography, safety, metal construction, engines, wireless, instruments, and so forth. C. G. G. discourses entertainingly and suggestively on "light aeroplanes"—and Sir Alliot V. Roe's reminiscences are interesting—but are there no other pioneers besides "A. V. R."?

The illustrations are good, but was it really necessary to go to the expense of the rotary photogravure plates? The half-tones are good and the plates do not help, because of their thickness, with the binding,—and this is a book which will receive severe handling.

If one may make a suggestion for future editions it is that a bibliography should be included dealing with all the important books, papers and lectures which have been published during the year on aeronautics. Such a list is badly needed. One is published each year in America and is of great value, but it does not deal fully with British aeronautics.

For the rest one thinks that the author has steered clear of his many pitfalls and we wish him all success in his labours to come.—S. G.

Physics of the Air. W. J. Humphreys. xii+654 pp., many illustrations and diagrams. McGraw-Hill Publishing Co. From THE AEROPLANE Book Department, Cannon House, Pilgrim Street, E.C.4. 30s. net.

The first edition of Dr. Humphreys' valuable text-book has been out of print for some time, and so the appearance of a new edition of this original work is welcome, especially as in the meantime the distinguished author has added much new material.

Dr. Humphreys in his capacity as meteorological physicist to the United States Weather Bureau has published many interesting and valuable books on specialised aspects of meteorology, but in the work we have before us he treats of the mechanics and thermodynamics of the atmosphere, atmospheric electricity, meteorological acoustics (this an entirely new addition to the book and a most valuable one), atmospheric optics, and a most exhilarating section on factors of climatic control.

To attempt to review a book of this character, in the ordinary sense, is next to impossible, for the subject he covers is so vast. To appreciate the book in its entirety requires a knowledge of pure applied mathematics and science up to the standard of a Bachelor of Science degree. But this should not deter those who are not so equipped from dipping into the book and emerging richer from the immersion.

There is a great deal in the book which will be intensely interesting to the pilot and observer of aircraft—and the present reviewer, with due temerity, recommends that the Libraries of Squadrons of the Royal Air Force should add it to their collections. To the meteorologist Dr. Humphreys needs no introduction—except to say that this would seem to be the best book he has yet written.—S. G.

(Continued on opposite page.)

THE SAFETY FIRST COMPETITION.

Mr. Harry F. Guggenheim, President of The Daniel Guggenheim Fund for the Promotion of Aeronautics, announces the acceptance of six new American entries in the International Safe Aircraft Competition. At the same time two British entries—Vickers Ltd. and the De Havilland Aircraft Co. Ltd.—have been forced to withdraw on account of the extreme pressure of work in connection with British Government requirements.

The total number of entries in the Competition is now 16. The new entries, all of whom are American manufacturers, are as follows:—

The Cosmic Aircraft Corporation, Bridgeport, Connecticut; submitting a sesqui-type cabin plane, incorporating a special type of slot and flap in combination; Warner engine.

The Cunningham-Hall Aircraft Corporation, Rochester, New York; submitting a two-place, low wing, semi-cantilever monoplane; high lift wing with special flaps and special control; Genet engine.

This company was organised late in 1928, bringing into the industry a 90-year-old vehicle company, James Cunningham, Son and Co. It plans to produce six-place cabin, all metal, and four-place cabin planes.

The Dare Airplane Company, Detroit, Michigan; submitting an all-metal, two-place, low wing monoplane; Dare variable camber wings, capable of varying the camber in flight; Warner engine.

Fleet Aircraft Inc., of Buffalo, New York; submitting Fleet Model 2 biplane, specially streamlined, and with a newly-designed flap gear on the wing; Kinner engine.

This company is a subsidiary of the parent organisation—The Consolidated Aircraft Corporation of Buffalo—best known for its training planes.

The Pitcairn-Cierva Autogiro Co. of America, Bryn Athyn, Pennsylvania; an American-built Autogiro with such modifications as the Pitcairn Company may find desirable to install to improve the qualities of the plane; Wright J-6 engine.

This company is a subsidiary of Pitcairn Aircraft Inc., which manufactures five types of planes.

The Rocheville Aircraft Corporation, Los Angeles, California; submitting an externally braced, parasol type monoplane with variable camber and variable thickness wing; Hallett engine.

Of the 16 entries in the Competition to date 12 are from the United States, three from Great Britain and one from Italy. The manufacturers remaining in the Competition previous to this announcement are as follows:—

From the United States: Curtiss Aeroplane and Motor Company; Schroeder-Wentworth Associates; Charles Ward Hall, Inc.; Heraclio Alfaro; J. S. McDonnell, Jr. and Associates; and the Brunner-Winkle Aircraft Corporation.

From Great Britain: Handley Page; The Gloster Aircraft Company Ltd.; and Cierva Autogiro.

From Italy: The Societa Italiana Ernesto Breda of Milan.

Major R. H. Mayo, British representative of The Daniel Guggenheim Safe Aircraft Competition, writes as follows:—

I have received a cable from the Daniel Guggenheim Fund for the Promotion of Aeronautics, informing me that the Trustees have decided to close the list of entries for the Daniel Guggenheim Safe Aircraft Competition on September 1, 1929. They have also decided that the closing date for the Competition itself will be October 31, 1929.

You will remember that under the Rules of the Competition the Fund reserved the right to close the list of entries whenever in its opinion sufficient entries had been received to give a reasonable prospect that the object of the competition would be achieved. The decision to close the list of entries on September 1, 1929, has been taken accordingly.

With regard to the closing date of the Competition, you will remember that the Fund reserved the right to advance the date of closure, but the decision quoted above indicates that the Fund will not exercise this right. Any Competitor who presents his entry at Mitchel Field, Long Island, on or before October 31, 1929, will thus be eligible to compete in the Competition and sufficient time will be allowed for such entry to pass through all the tests.

THE GRAF ZEPPELIN.

On August 10 the *Graf Zeppelin* landed at Friedrichshafen at 13.00 hours on its return flight from America. This day was the 61st birthday of Dr. Eckener, the pilot of the ship, and the close friend of the late Count Zeppelin.

She covered the distance from Lakehurst in 55½ hours, which is the shortest time yet made for an airship crossing in either direction.

The course taken lay over the Azores, then over the Scilly Isles, finally over Paris and thence to Friedrichshafen.

The time taken for the double journey was just 10 days.

Dr. Eckener is making preparations for a World flight and hopes to leave for Tokyo on Aug. 15. His proposed course lays across Russia and Siberia to the southern end of Lake Baikal, and he hopes to reach Tokyo on Aug. 18.

After a few days there the flight will be continued to Los Angeles and Lakehurst, which should be reached by the end of the month.

THE AIRSHIP AT HOME.—The Graf Zeppelin before leaving Friedrichshafen.

FRENCH AIR POLICE.

According to the Paris correspondent of *The Times*, the French Air Ministry has issued a bulletin warning aviators that there is in existence an aerial police force under the authority of the Ministry of the Interior, which is empowered to deal with infractions of the rules laid down for the proper conduct of flying.

The police machines have orders to prevent, as far as possible, such infractions, and to pursue offenders and call on them to land. Their summons, the equivalent to a shot across the bows, will take the form of harmless projectiles which, on bursting, give off a thick black smoke.

U.S.S.R.—U.S.A.

At 02.52 hrs. on Aug. 8 an A.N.T.-4 monoplane, which, it is believed, is fitted with two Jupiter engines, left Moscow in an attempt to fly to America. It landed at Omsk at 16.48 hrs., having covered a distance of 1,380 miles non-stop.

The machine will cover the following route: Omsk, Krasnoyarsk, Chita, Kharbarovsk, Nikolaevsk, the Aleutian Islands, Seattle, San Francisco and New York, which represents a total distance of approximately 12,000 miles.

At Kharbarovsk a float undercarriage will be substituted for the wheels and the wheels will be replaced at Seattle. The pilots are MM. Shestakoff and Bolotoff.

MODELS OF BRITISH AIRCRAFT.

Those who were unable to visit the International Aero Exhibition at Olympia will be interested to know that a selection of the best models of British aircraft from the Exhibition are being shown, until further notice, at the Royal United Service Museum, Whitehall, S.W.1, from 10.00 hours till 17.00 hours every weekday. The general public are admitted to the Museum for 1s. and members of H.M. Forces in uniform are admitted free.

THE VALUE OF WEATHER REPORTS.

The Daniel Guggenheim Fund for the Promotion of Aeronautics has recently made public its report of the complete success of the trial weather reporting system over the airway between San Francisco and Los Angeles.

The service was sponsored and financed by the fund for the year beginning June, 1928, in co-operation with the Pacific Telephone and Telegraph Company, the Army and Navy Air Services, the Department of Commerce, and the Weather Bureau.

The success of the experiment is indicated by the fact that during that time the crowded airway between Los Angeles and San Francisco was flown without a single accident attributable to weather. In contrast to its value, the cost of operating the entire system, of over 400 miles in length, was found to be nearly equivalent to the cost of one of the three-motored monoplanes carrying passengers over this route.

Final approval was stamped on the experiment by the order issued by the Bureau of Aeronautics of the Department of Commerce and by the Weather Bureau that from July 1, 1929, the service will be assumed and operated at Government expense, and that a service more or less similar will be organised for some of the other airways. The report says:—

It is obvious that aviation faces the same problem in regard to roadways of the sky as the automobile in its early history faced in regard to the roads on land. The uncertainty as to whether the road ahead was good or bad has been holding back the use of the airplane and retarding the normal development of this industry.

The San Francisco-Los Angeles route was selected for the trial system both because of the variety of weather conditions prevailing in California, and because of the dense amount of air traffic—three passenger and express lines and an air-mail service—already connecting the two cities.

The system consists of four central weather bureaux, one at each of the terminal fields, and two at the intervening ports of Fresno and Bakersfield. These four centres are connected by wire with over thirty subsidiary stations scattered in such a manner as to give comprehensive information of conditions along all possible lines of flight.

By means of a ceiling light or ceiling projector, consisting of a concentrated beam of light which is focussed on the cloud layer, the height and nature of a fog may be measured at night. During the day a small pilot balloon, inflated with hydrogen and known to rise at a given rate per minute, is used for the same purpose by recording the time of its disappearance in the cloud ceiling. The balloon method is likewise used to determine the speed and variability of winds at the various levels, and by taking advantage of a following wind at a certain altitude a pilot can greatly increase the cruising speed of his plane.

Information at the various airports is supplied to the pilot in printed form reports, issued several times daily and designating the speed, height and direction of wind, the visibility and altitude of cloud ceilings, and the general weather conditions prevailing over all the intermediate regions of the route. In addition, maps are provided at the main airports giving a picture of weather and wind conditions in all regions. The pilot is thus enabled to select the more favourable route to his destination.

The Tail of the "Graf Zeppelin" concluded from the opposite page.

The report says further:—

There are those who say that aviation has not yet developed sufficient traffic to justify an intensive meteorological service of this kind. The reply is that aviation during its early stages must have this type of meteorological service if it is to continue to progress. Later, when mechanical aids to aviation are developed to the point where a machine can be navigated in almost any kind of wind and weather, the service in this intensive form may not be so badly needed, but now it is; so much so, that passenger-carrying should be prohibited before a meteorological service is organised along the route or routes to be flown. The meteorological service and other aids should come before the scheduled flying.

As a matter of fact, information supplied by such a service could be used advantageously to aid many organisations and industries, and this has already been demonstrated in California. The information supplied by it has been used by the Automobile Club of Southern California to advantage in advising tourists of the weather and temperature likely to be encountered by them in going from place to place.

Also this system of weather-reporting has proved its usefulness in permitting the issue of accurate rain warnings in the late summer and early fall months when the unannounced coming of rains would destroy millions of dollars' worth of fruit being sun dried on trays in the open. A rain that would drench drying fruit would greatly decrease its grade and render much of it unmarketable. Stacking the trays prevents damage by rain.

Researches have proved that low humidity is a very important factor in the bringing out of high fire hazard and rapid spread of fires. Moreover, wind affects the rapidity of travel or spread of fires. It will be important and valuable information to those supervising the forces engaged in the suppressing of a large fire to know what changes are to be expected within the next several hours in wind, weather and humidity.

Such a service might also give to street and engineering departments in the cities advanced information as to snow-storms, calling for the expenditure of large sums of money for the snow removal. It might also supply valuable information for flood forecasts and could be used very effectively for giving ample warning of the approach of local thunder-storms and wind-storms of tornadic characteristics. It has, in short, a very general benefit for civilisation as a whole.

OLD SOLDIERS NEVER DIE.

The age of aircraft, more particularly of metal aircraft in military service, is an interesting subject. There must be a number of aircraft in service in this country of which the constructing firms have records. But unfortunately no information on this subject has ever been released.

There are in existence in France the first two Breguet XIX biplanes ever constructed, and it may be of interest to recount the activities of these two machines.

Breguet XIX No. 01, the very first of the long series of this famous aircraft, came out of the Breguet Works in 1921. After long testing, with various wings of different sections, the machine, in the Autumn of 1922, was submitted to a series of demonstrations at Villacoublay before various official bodies.

In January 1923 the machine proceeded to Madrid to compete in an International contest organised by the Spanish Government in Madrid. Equipped as an Army Co-operation aircraft No. 01 beat all other competitors, and was finally bought by the Spanish Army.

After two years of miscellaneous flying the 375 h.p. Renault engine was removed and one of 400 h.p. substituted and the tankage was increased. On Aug. 26, 1925, piloted by Capt. Jimenez, it beat the Spanish distance record by covering 1,640 kms. in 12 hours. Two days later the same pilot put up a Spanish duration record of 13½ hrs., covering a distance of 1,860 kms. On the following day Capt. Jimenez made a non-stop flight of 1,480 kms. The two last flights together represented a complete tour of the Iberian peninsula in 36 hrs. elapsed time, or 24½ hrs. flying time.

In October 1925 the machine made a flight from Madrid to Angoulême and back, a distance of 1,480 kms.

Hereafter the machine was fitted with larger tanks, and in April 1926 Capt. Jimenez took off with a total load of 3,800 kgs., in a preliminary test prior to attempting to break his own duration record, but was forced to land after being in the air for only half an hour. This he did safely with full load.

After this the engine was again changed. This time an Hispano-Suiza was fitted, and several further long cross-country flights were made over Spain and Spanish Morocco.

In January 1928 the Spanish duration record was again broken in a flight from Seville to Safi, Morocco. The landing at the latter place was made in the dark after being in the air for 14 hrs. 10 mins.

The machine is at present at Cuatrovientos aerodrome, Madrid, where after eight years' hard service it is still in good condition.

The second Breguet XIX was the first of a series of 70 ordered by the French Government and passed out of the works at the end of 1923. This machine differed from No. 01 in several details, notably in the interior arrangement as demanded by the new French Government specification for the *Corps d'Armée* type. In addition it was the first of the type to have the now characteristic Breguet undercarriage and internally-sprung wheels.

This machine in March 1924 was submitted to the *Commission d'Essais Pratiques de l'Aviation* for complete test and it remained at the C.E.P.A. for three years, during which it made 201 test flights, including tests for endurance, speed, consumption, manœuvrability, airscrew, radiator, and military equipment, in the hands of various pilots. In these three years the only modifications made to the machine were a change of engine and the recovering of the rear half of the fuselage.

It then passed out of the hands of the C.E.P.A. to the *Entrepôt Spécial d'Aviation No.* 1 and in January 1928 again passed into service. After a short overhaul the machine was flown regularly. From February to September 1928 it flew 100 hrs. in times varying from 20 mins. to four hours' duration.

This machine is also still in regular service. These two aircraft provide ample evidence of the durability of modern military aircraft.

Possibly the Fairey Co. could produce some similar figures for a IIID. They would be interesting.

FOR THE ULSTER T.T. RACE.

Pilots who wish to fly to Belfast for the Ulster T.T. Race on Aug. 17 are notified that the following arrangements have been made by the Automobile Association: A landing ground with a circle and a wind-stocking has been prepared at Lochans, two miles from Stranraer. Fuel can be got on the aerodrome if the pilot first circles the village of Lochans. The telephone at the Corner House adjoining the landing ground is placed at the disposal of pilots by Mr. Clanachan. Weather reports for the Channel Crossing can be obtained from the Coastgard Station at Portpatrick—telephone No. Portpatrick 9. Hotel accommodation is available at the King's Arms Hotel, Stranraer. Motor transport can be hired from Mr. MacWilliam, Engineer, Lochans.

The following approximate distances by air from Lochans should be noted: Aldergrove Aerodrome, Belfast, 50 miles; Wythenshawe Aerodrome, Manchester (via the coast), 180 miles. Cramlington Aerodrome, Newcastle, 140 miles.

The R.A.F. aerodrome at Aldergrove 2½ miles from the East shore of Lough Neagh, is the only one available for Belfast. Belfast is 12½ miles away. Motor transport can be hired from the following garages in Antrim: James Bird, 'Phone Antrim 30; Franklin Young, 'Phone Antrim 28; Joseph Barr, 'Phone Antrim 26.

Mr. MacWilliam, Engineer, Lochans, can telephone to Antrim for cars to be ready on the aerodrome against the arrival of pilots.

FLYING SAFER THAN RAILROADING.

The following editorial, headed as above, appeared in the July issue of *Aero Digest*, published in New York:—

In commenting on the English Channel accident of the Imperial Airways passenger transport on June 17 in which seven passengers were drowned, the New York *Herald-Tribune* says:—

"Commercial aviation in England has had other serious disasters. A French airliner crashed in flames at Penshurst, Kent, on October 2, 1926, and five passengers burned to death. On Christmas Eve, in 1924, an Imperial Airways liner crashed just after leaving Croydon and eight were killed. On September 14, 1923, five were killed on a London-Manchester air express at Ivinghoe."

To show how false is the impression with regard to the safety of flying given by this and many other stupid comments of like nature, the following facts may be of value:

Up to the end of December, 1928, paying passengers travelled by the British regular air transport services operating from England to the number of 118,816, with a loss of 13 passengers, in four fatal accidents in the course of 7,050,000 miles of flying. This gives a rate of one fatal accident involving passengers for every 1,762,500 miles flown, and one fatality for every 542,307 miles flown.

Statistics of the Interstate Commerce Commission show that 6,500 persons were killed and 85,560 injured as a result of railroad operation in 1928. During the year passenger trains travelled 521,349,000 miles and freight trains 601,648,000 miles, making a total of 1,122,997,000 miles. Dividing this figure by the number of persons killed, we have one fatality for every 172,768 miles travelled by rail.

The Department of Commerce estimates that planes flew approximately 70,472,000 miles in the United States during 1928. The total loss of life in civil aviation was 368 and 672 persons were injured. This means that in flying one life was lost for every 191,500 miles travelled, which is a better record than was made by the railroads.

Thus the safety factor of English commercial aviation is shown to be 3.1 times that of American railroads, while American air travel is safer than train travel.

The above shows how the daily papers, even in the United States, pander to the morbid tastes of their readers. *Aero Digest* deserves thanks for its outspoken criticism.

In all fairness to both British and American civil aviation it should be pointed out that the British figures quoted refer only to the operations of our one civil air line from its inception, whereas the American figures cover the entire civil air operations of the United States for 1928, which included 37 regular air lines operated by private companies over 63 different air-ways aggregating a distance of 20,800 miles, not to mention the large number of smaller companies operating taxi services, sightseeing trips, schools, etc.

But, if and when one starts multiplying miles by passengers and calculating in passenger-miles, then the railways score, because the train-miles are multiplied by anything between 200 and 500, whereas the aeroplane miles are multiplied by only five or six.

FLYING AT CLACTON.

The Brooklands School of Flying are holding a display of Flying at Alton Park Road Flying Ground, Clacton-on-Sea, on Wednesday, Aug. 28. The Meeting will be opened by Mr. J. E. Ball, J.P., Chairman of the Clacton Council, at 11.00 hrs., and besides the usual joy rides from 5s. with Mr. E. A. Jones, which are now available daily at Clacton, a varied programme is being arranged consisting of displays of aerobatics by well-known pilots, bombing cars from the air, and, it is hoped, a parachute descent.

FOR A WILLING BEGINNER.

A business firm of considerable importance has open a position which offers great opportunity to an enterprising man, though the salary is small at the start. Applicants should be between 25 and 30 years of age. They should have first-class flying experience, preferably with experience as test pilots, a B.Sc. degree for engineering would be an advantage, or even an associate fellowship of the Royal Aeronautical Society. Applicants must also have a certain amount of business experience and first-class references. Letters marked L will be forwarded.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE CHALLENGE INTERNATIONALE DE TOURISME.

On Aug. 7 forty-three of the fifty-five survivors of the original eighty-two entrants for the *Challenge Internationale de Tourisme* left Orly on the 3,900 mile tour of Europe.

The competitors left the aerodrome in batches of four at five-minute intervals.

The first four competitors left at 09.25 hrs. These included the two Raab-Katzenstein R.K.-25 monoplanes one with a Cirrus and one with a Hermes engine, piloted by Herr Altmeier and Lord Carbery respectively, the Darmstadt D-18 (Genet) piloted by Nehring and Guerchais-Henriot (Salmson) piloted by Lemerre.

The two British competitors, Miss Spooner and Mr. Hubert Broad, both on Gipsy-Moths, left in company with two Caudron monoplanes piloted by MM. Delmotte and Barbot.

By 17.00 hrs. thirty-five competitors had arrived at Geneva and had continued to St. Raphael.

At the end of the first day several competitors had withdrawn. A Klemm (Salmson) flown by Hagenmeyer was damaged on landing at Berre near Marseilles, the C.A.N.T.26 (Isotta-Fraschini) piloted by Stoppani was damaged at Basle, an Avia Antilopa (Walter) flown by M. Vlcek was forced to land at Marignane and was damaged.

The Hon. Lady Bailey, who arrived at Orly too late to qualify for the contest, decided to go round the course *hors concours*.

On Aug. 8 the remaining competitors left for Turin and beyond. The Guerchais-Henriot and the Belgian St. Hubert monoplanes were non-starters. The first four to arrive at Turin were Lord Carbery (Raab-Katzenstein RK-25-Hermes), Mr. Broad (Gipsy-Moth), Herr Altemeier (Raab-Katzenstein RK-25-Cirrus), and Miss Spooner (Gipsy-Moth).

At 17.03 hrs. Mr. Broad arrived at Belgrade, and he was immediately followed by Lord Carbery. Herr Altemeier (Klemm-Cirrus) crashed within six miles of Venice owing to a fuel stoppage when holding second position. The machine was wrecked but the crew were unhurt.

On Aug. 9 the leading competitors started for Bucharest, the farthest east point in the circuit, and Budapest. Only seventeen covered the 1,730 miles between Orly and Bucharest. Delmotte (Caudron-Salmson) was the leader at this point. Signor Liberrati (Breda-Cirrus) damaged his machine on landing and retired.

On Aug. 10 the competitors continued to Vienna and Prague. Lord Carbery (Raab-Katzenstein-Hermes) was the first to arrive at Vienna at 10.00 hrs., and he was followed by Miss Spooner (Gipsy-Moth), Mr. Broad (Gipsy-Moth), Herr Kirsch (Klemm-Cirrus), Herr Nehring (Darmstadt-Genet), M. Kleps (Avia-Walter), Herr Offermann (B.F.W.-Siemens), and M. Delmotte. All with the exception of Nehring filled up and continued to Prague.

Herr Nehring and three Fiats, and four Romeos and one Junkers (Genet), which arrived during the afternoon, decided to wait at Vienna until the following day, owing to head winds and bad weather reports.

On Aug. 11 several more competitors arrived at Vienna against a strong head wind and several left for Prague. Lady Bailey also left for Prague. Some were left at Vienna until the following day owing to rain and very bumpy conditions.

Those who had reached Prague the previous day left on the Breslau—Warsaw—Posen—Berlin—Hamburg leg.

At Breslau Mr. Broad (Gipsy-Moth) arrived first, followed by Herr Kirsch (Klemm-Cirrus), Miss Spooner (Gipsy-Moth) and Lord Carbery (Raab-Katzenstein-Hermes).

At Warsaw and Berlin Mr. Broad was still leading and at the latter city Herr Kirsch had dropped to fourth place. Lord Carbery was held up at Berlin with a broken oil-pipe but Mr. Broad and Miss Spooner continued to Hamburg where they arrived at 17.15 hrs. and 17.21 hrs. respectively.

On Aug. 12 the competitors continued to Amsterdam. Mr. Broad and Miss Spooner were the first to leave Hamburg. They were passed, however, by Herr Kirsch (Klemm-Cirrus), who was the first to arrive at Amsterdam. He was followed by Mr. Broad and Miss Spooner (Gipsy-Moths), M. Kleps (Avia-Walter), Lord Carbery (Raab-Katzenstein-Hermes), M. Delmotte (Caudron-Salmson) and Herr Offermann (B.F.W.-Siemens).

In the meantime many competitors were completing earlier stages,—several owing to minor mechanical troubles and several owning to bad weather. Lady Bailey arrived at Warsaw from Breslau.

As competitors are not allowed to arrive at Orly before 15.00 hrs. on Aug. 14 the early arrivals at Amsterdam had to remain there until the following day when they could proceed to Brussels. Here another night stay is necessary before completing the circuit at Orly.

Up to Amsterdam Miss Spooner and Mr. Broad have completed a daily average mileage of 685 miles since leaving Orly on Aug. 7. Their enforced stays at Amsterdam and Brussels will reduce this average to 488 miles.

Their performance as the only two official British competitors although entered through the French Aero Club is magnificent. That they should have lost the lead to Herr Kirsch at Amsterdam is sad, but we can console ourselves by the fact that Herr Kirsch is using a British engine as are many of the foreign leaders throughout the circuit.

WHAT IS IT?—The Albessard tandem monoplane (Salmson engine) which bears a strong family resemblance to the Peyret tandem glider of Itford Hill. The Albessard monoplane was built by M. Louis Peyret.

Digitized by Google

In any case the exact position of competitors in this contest is not necessarily indicated by their arrival times at the various stops. Points were awarded at Orly in preliminary tests in connection with fuel consumption, construction, etc. These will be combined with average speed over the European circuit to decide the actual winner.

All competitors have been unanimous in expressing their appreciation at their reception in all places. Fueling and timing arrangements have been excellent, and for a competition covering so large an area and coming under the jurisdiction of so many different official bodies everything has gone off successfully and according to plan.

A CORRECTION.

Never in the history of The Aeroplane has one had so much pleasure in correcting a mistake as one has now in stating that Herr Offermann, the German pilot who was reported as having been killed at Orly before the start of the European tour, is, at the time of writing, alive and well and flying strongly.

The mistake arose because in the report of the fatal accident the pilot's name was given as Hoffmann, and in the official programme no pilot of the name of Hoffmann appears. Herr Offermann's name was the nearest to Hoffmann and a mistake of that kind is precisely such as does occur in transmitting names verbally, especially by telephone.

The day after The Aeroplane went to Press, a visitor who had just returned from Orly said that Herr Offermann had in fact started in the Tour. Thereafter a careful search discovered, in a mimeographed sheet issued on the Sunday before the start by the Aero Club de France, that Doctor Eggers, whose name appeared in the programme as the pilot of the Arado monoplane, had in fact a passenger named Hofmann.

Further inquiries then disclosed the fact that this unfortunate Herr Hofmann had been flying the Arado at Orly and that while he was looping and spinning the machine, the wing, which was held by a very light structure of steel tubes, came off. A picture of this machine appears on page 400 of The Aeroplane, and engineers will not be surprised that a big high-lift wing, with an aeroplane slung below it in that particular way, should come off.

While sympathising with our friends in Germany on the death of their friend Hofmann, whom one had not the honour of knowing, one rejoices that our good friend Herr Offermann is still alive. And one hopes that he may live many years to continue his good service to German Aviation.—C. G. G.

A NEW HEIGHT RECORD.

The Royal Aero Club has informed Glenny and Henderson, the constructors of the Gadfly light monoplane (A.B.C. Scorpion engine), that the height of 3,021 metres (9,911 ft.) obtained by the machine on May 16 has been homologated by the *Fédération Aéronautique Internationale* as a World's Record.

This record is for Single-Seat Light Aeroplanes (4th category) weighing not more than 200 kgs. (440 lbs.).

THE LIVERPOOL—MANCHESTER INTER-CITY RACE.

Northern Air Lines held the first inter-city race with Liverpool at the temporary municipal aerodrome at Wythenshawe near Manchester on Saturday, Aug. 10.

The start was at Wythenshawe and the course lay round a mark at Hooton Park aerodrome at Liverpool and back to Wythenshawe. One hour's wait at Hooton was compulsory.

Quite a large amount of enthusiasm had been raised for the race and it bids fair to become an important annual event among those who fly in these cities. When the idea was first started Sir W. Cundiff was approached and asked to associate himself with a cup or trophy to be competed for annually and he very generously gave his wholehearted support and presented a large trophy as well as a replica for the pilot.

The conditions are that entrants and pilots must be resident within 30 miles of either city and the aircraft must be standard and not specially faked up for the race. The Royal Aero Club arranged the handicapping and looked after the starting and finishing times.

Three pilots from each city took part and were all amateurs.

The Liverpool team were,—J. B. Allen, Avian (Cirrus II) G-EBXX; A. Moulsdale, Avian (Cirrus II) G-EBWK; T. H. Naylor, Moth (Gipsy) G-AABO.

The Manchester Team were,—Miss W. Brown, Avian (Cirrus II) G-EBVZ; J. C. Cantrill, Avian (Gipsy) G-AAHK; E. Cohen, Avian (Cirrus III) G-AAGR.

The general arrangements for the race were admirable and one novel and excellent feature was that two machines flown by Flt. Lt. Comper and Mr. Boyes were stationed in the air on the course to ensure that no one flew below 500 feet. Any who did so were to be disqualified.

The result was a very close race and a really exciting finish. The handicappers are to be congratulated.

In a race of this nature one sees very little except the actual start and finish and the interest of the onlookers is apt to flag unless there is the hope of a close finish. But in this case none could have cavilled at the handicapping, for the machines at the finish appeared to be approaching in a bunch. Actually there were just enough seconds between each to make it safe without losing the excitement. The results are tabulated below:—

Pilot.	Start.	Arrival at Hooton.	Arrival at Wythenshawe.	M.p.h	Place.
Moulsdale ..	3.30.00	3.50.46	5.08.11	88.01	4
Allen	3.30.00	3.50.25	5.07.20	90.00	3
Miss Brown ..	3.30.00	3.50.47	5.08.19	87.70	5
Cohen	3.31.57	3.53.08	5.11.12	85.11	6
Cantrill	3.32.37	3.51.20	5.07.05	97.80	2
Naylor	3.32.56	3.51.17	5.06.59	98.52	1

Mr. Naylor, the winner, is a private owner who has only been flying for about eighteen months and he was opposed by several much more experienced pilots, so his performance is all the more creditable. He had as his passenger (all machines had to carry passengers) Mrs. Reynolds, the daughter-in-law of Sir J. Reynolds,—who presented a cup as a team prize.

AN AMERICAN EAGLE.—The American Eagle A-429 light aeroplane (60 h.p. Le Blond engine). It is fitted with side-by-side seating and folding wings.

This team prize was awarded on a marking system based on the finishing positions of the machines and this was also gained by the Liverpool Team.

Before, coincident with, and after, the race a series of turns kept the crowd amused. The crowd is rather an exaggeration as there cannot have been more than 2,000 or 3,000 present, but those there were keen and in these days a crowd of even this size is not to be sneezed at. One heard several officials bemoaning the fact that there were not nearly as many as they had for their previous pageant. At that show somewhere about 10,000 arrived, which must be a record even for a city the size of Manchester, and it would be unreasonable to expect anything like the same number again.

After all even the public are becoming a trifle blasé about air shows and unless they have very good publicity indeed and there is some special attraction one cannot expect much more than an attendance of those who come because they are really keen on this sort of thing, and not merely to pass the time away. On one's way to the aerodrome one failed to see any posters or publicity at all, which seemed a pity, seeing that it was, after all, a City affair with the Trophy for the race given by a prominent local man.

Sir Sefton Brancker, who had been staying at Bolton, came over in one of the Northern Air Lines Moths—his own machine apparently feeling off colour at being called upon so early in the morning. He waited for the start of the race and then left for London in the same machine.

Mr. Lawson opened the programme with a display of stunting on an Avro. His various manœuvres were quite pretty but somehow stunting in Avros always seems dull when compared with the snappiness of a Moth or similar light aircraft. He got right in the line of the sun and very bright clouds and one consequently lost a good deal of his show. It was a pity he did not repeat his Scarborough performance and land with a dead engine; this was a particularly effective effort and besides drawing much applause from the crowd served very well indeed to show that it is possible to land without one's engine, a fact that few of the public seem to understand.

After the start of the race he again went up and did some inverted flying. It is to be feared that the difficulty of this form of amusement is not appreciated by the usual run of spectators.

Our D.C.A. having borrowed the firm's Moth the "wedding party" had to be bombed from an Avro. Since the Scarborough show they had acquired severel large-sized infants and these, dressed, neatly and tastefully, in white crepe-de-chine (or was it calico) party frocks were given balloons and other playthings and left to amuse themselves on the aerodrome while Pa and Ma had a short nap in the car. The shameful way in which Capt. Kingwill came along and disturbed them caused much amusement. One wonders whether, if the present multiplicity is kept up, at the next Wythenshawe meeting we shall see not one car—by this time heavily overloaded!—but a whole fleet of Baby Austins led out in formation and playing touch round the Aerodrome.

After this we were treated to that really funny turn of Mr. Kingwill's. As a spectator rashly trying his hand at flying he is really good and there was no doubt about the appreciation of the crowd at the end. He was handicapped by having an Avian with an early and low-powered engine, —but even so was killingly funny.

At this point the competitors were due in at the finish of the Race and duly arrived in the order already mentioned.

After their arrival proceedings rather dragged. One would like to suggest to the management that to sustain the interest in these meetings they must be run snappily. Waiting to see what is going to happen bores the crowd more than anything. Ten minutes is the average time for events, and it would be far better to repeat everything twice and so have something doing all the time than to have people waiting around for half an hour or more before the next event. Watching others joy-riding does not interest the majority, and with an aerodrome of this size the joy-riding machines might well be apart from the main show.

The set piece was again the burning oil-well. When burning merrily a D.H.9 raced down and the occupants raced across and put out the flames with the help of Fire Snow outfits. These certainly worked effectively and should be the right thing for a real fire.

The Lancashire Club sent over some pilots who did a little formation flying and showed that pupils are well trained at that club.

Later Mr. Kingwill took off in his illuminated Avian. The lower planes, fuselage and tail units have been outlined with small electric lamps and when he switched these on as it was getting dusk and started stunting at 3,000 feet it was extraordinarily effective. He continued to fly round until it was very nearly dark and finally landed with the help of,—or in spite of,—the head-lights of various cars which had been switched on. This sort of show should prove a great attraction at seaside resorts which are out to do things to amuse their visitors and one recommends all live Town Clerks to get in touch with the Northern Air Lines people and see about it.—C. N. C.

THE BITER BIT AT BOURNEMOUTH.

A D.H. Moth, piloted by Mr. John Hoare, an apprentice of the De Havilland Co. Ltd., dived into the sea at Bournemouth on August 11 while taking part in a regatta.

The machine was "bombing" a speed boat with bags of flour and overshot its mark. Mr. Hoare and his passenger, Mr. Read, were rescued and neither is badly injured. The machine was salved in a badly damaged condition.

MOTH SERVICE.

The following story comes from a most reliable source:—

A Moth owner landed in a field near Sevenoaks with plug trouble. He walked half a mile to a telephone box and rang up the nearest Moth Service Station, which was the Brooklands School of Flying. When he got back to his machine a new plug had been fitted.

The explanation is that when the telephone call came through to Brooklands a machine was standing on the tarmac and its pilot was a man who knew the field near Sevenoaks in which the stranded pilot had landed. He flew straight off with the new plug and had fitted it before the owner got back from the telephone box.

AUSTRALIAN-BUILT MOTHS.

The Aeroplane of March 20, 1929, reported the fact that the Australian Defence Department had placed orders for 32 D.H. Moths to be built locally.

News from Australia shows that the tender was secured by the Larkin Aircraft Supply Co. Ltd., Melbourne, whose chief engineer is Mr. W. S. Shackleton, formerly designer to William Beardmore and Co. Ltd., of Dalmuir.

The Larkin company is now awaiting a complete set of drawings before putting the machines into production. This order is the first order given by the Commonwealth Government for mass production in Australia.

SUSPENSION OF CLUB MEMBERS.

The Committee of the Cinque Ports Flying Club have had to deal with two breaches of discipline by "A" licence pilots recently. One concerned low flying over the beach at Littlestone. In this case the pilot concerned was severely cautioned. The other concerned two unauthorised landings on Club aircraft away from the Aerodrome. The pilot concerned was suspended from flying club aircraft for two months from the date of the offence. The committee are determined to deal in future with such cases in a firm manner, as incidents of this description are calculated to cause inconvenience and annoyance to the public. This cannot be tolerated.

July beat all previous records for the Club by a very large margin. The two Club aircraft made 284 flights, totalling 124½ hours in the air, which is equivalent to a distance of about 9,000 miles.

During this month, also, the number of flying members first reached the 100 mark. There were 101 flying members and 15 ground members on the register on July 31. As, however, only about half of these members are actually under instruction, there is ample opportunity for new members without inconvenient waiting.

The Annual General Meeting of the Club was held on Aug. 8, and the Hon. Secretary's report, which was adopted, showed that whereas at the last Annual General Meeting the Club had one Moth and a small stock of spares with a credit balance of some £500, the Club now had a comprehensive stock of spares and tools and a credit balance of £250, and, in addition, a Club Room with bar and steward, office, garden and lawn had been established at Lympne out of working profits.

On the proposition of Major Krabbe, it was resolved that as a reward for their services in the past, the Hon. Treasurer and Hon. Secretary be granted flying facilities at reduced rates when the aircraft and pilot instructor were not required by any other member, and they were to be Honorary Members of the Club while they held office.

Major Krabbe was elected Chairman of the Club for the ensuing year, Mr. R. Dallas Brett and Mr. H. E. Twaites were re-elected Hon. Secretary and Hon. Treasurer respectively, and the new Committee is as follows:—Mr. A. Dallas Brett of Folkestone, Mr. T. A. M. S. Lewis of Postling, Mr. K. Edgson Wright of Ashford, Mr. W. H. Evernden of Faversham, Capt. G. E. Took of Dover and Mr. A. J. Drake of Hythe.

A BRISTOL AERIAL GARDEN PARTY.

The Bristol and Wessex Aeroplane Club will hold an Aerial Garden Party at the Filton Aerodrome, Patchway, Bristol, on Sunday, September 22, as a farewell Display before they move to the new Bristol aerodrome. They hope to arrange for visits by a number of interesting new machines and a competition will also be in the programme.

Full details will be notified later, but in the meantime all those interested should make a note of the date.

ANOTHER INTRENAIONAL AIR RALLY.

An International Air Rally is being organised by the Suffolk and Eastern Counties Aeroplane Club at Hadleigh Aerodrome, Suffolk, in conjunction with a two-day Display to be held on Aug. 31 and Sept. 1.

The Rally is open to all types of aircraft of any nationality. Zero hour will be Noon on Aug. 31.

The winner will be the pilot who, having crossed the finishing line (a white line on the aerodrome from South to North) obtains the highest number of marks on the following formula:—$D \times (D \div 50) \div M$,—where D = Distance in miles from stated point of departure and M = Minutes + or — Zero.

Any competitor who is observed to be deliberately wasting time in the air will be disqualified.

The first prize will be £25, Second £10, Third £5.

During the two days of the Display there will be a bomb-dropping and a landing competition open to all pilots who have competed in the Rally. In each event the prizes will be First £3, Second £2.

During the Display pilots and passengers will be the guests of the Club.

Intending competitors are requested to write for entry forms to The Display Secretary, The Aerodrome Hadleigh.

THE LONDON AEROPLANE CLUB.

Report for the month of July.

Instructors: Major H. G. Travers and Capt. F. R. Matthews. *Ground Engineers*: C. Humphreys and A. E. Mitchell. *Aircraft*: The following machines were in commission—G-AABL, G-AABN, G-EBXS, G-EBZC, G-AAEX and G-EBWY.

Total Flying Time for the month of July:

The flying time for the month of July was a record: Dual instruction 341 flights, 150 hr. 25 5min.; Cross-country instruction 22 flights, 35 hr. 5 min.; Solo 302 flights, 125 hr. 30 min.; Passenger Flights 140 flights, 50 hr. 10 min.; Test Flights 105 flights, 17 hr. 30 min. Total 910 flights, 378 hr. 40 min.

During the month 225 individual members made flights on Club aircraft.

Twelve Months' Flying.

On July 31 the London Aeroplane Club completed its subsidy year and the results show a large increase on the previous year. The Club was able to earn the full Government subsidy.

Year ending July 31, 1929:

Dual instruction 2,584 flights, 1,116 hr. 35 min.; Solo 2,405 flights, 1,029 hr. 5 min.; Passenger Flights 586 flights, 221 hr. 20 min.; Test Flights, 960 flights, 161 hr. 5 min. Total 6,535 flights, 2,528 hr. 5 min.

This compares favourably with the previous year, when the total flying time was 1,413 hours.

"A" and "B" Licences.

During the year 64 "A" Licences and 4 "B" Licences were obtained.

A REMINISCENCE AND AN ANTICIPATION.—How the Winnepeg Club looks on a fine Winter day. Mr. de Blicquy, the Instructor, is the third from the right,—with cap.

COMMERCIAL AERONAUTICS.

THE CANADIAN CIVIL AIR PROGRAMME.

The 1929 Civil Air Programme of the Canadian Department of National Defence for the various Government Departments is as follows:—

Department of the Interior.

Forest Service. — The former area of 3,500,000 acres patrolled in Alberta is increased to 25,500,000 acres. The added area is in the Peace River district, where two light planes will operate out from Grande Prairie on detection work only.

In Saskatchewan the work has been reorganised and the planes will cover 21,250,000 acres in the interests of forest protection, both detection and suppression.

In Manitoba over 44,500,000 acres will be patrolled, for both detection and suppression purposes. Here also there is an increase in the area patrolled of about 7,000,000 acres to take care of territory subject to additional hazard through recent mining development.

The photographic work in connection with the survey of the Nelson River watershed is to be completed.

Topographical Survey.—Oblique aerial photography in connection with the study and mapping of the English River, Ignace, and Miminiska Lake areas in Ontario; Manitou, Cross Lake and Granville Lake areas in Manitoba; Reindeer Lake, Foster Lake, Mudjatik River, Fond du Lac and Black Lake areas in Saskatchewan.

Vertical aerial photography in connection with the study and mapping of the Lunenburg and Lake Rossignol areas in Nova Scotia; the Moncton and Newcastle areas in New Brunswick; the Tashereau, Senneterre, Parent, Doucet, Bell River and Maniwaki areas in Quebec; the Lake Nipissing, Algonquin Park, and Rideau Lakes areas in Ontario; Kississing Lake area in Manitoba; Prince Albert area in Saskatchewan; Shuswap Lake area and Parsnip River valley north of Prince George, in British Columbia.

National Parks of Canada.—Oblique aerial illustrative views of sites of historic interest when other operations permit. If planes are available the photography of areas between the Big Bend of the Columbia river in British Columbia and the Canadian National Railway. Continuation of the practice of co-operating with the Forestry Branch in the patrol of the Waterton Lakes park from High River base.

Natural Resources Intelligence Service.—The taking of oblique scenic photographs illustrating features of all kinds —settlements, power plants and sites, lumber and mineral developments, industrial plants, etc.—relating to the development of the natural resources of Canada.

Dominion Water Power and Reclamation Service.—Vertical and oblique photography in connection with power projects in New Brunswick, Quebec, Ontario, Manitoba, and British Columbia, including vertical photography of areas adjacent to the Winnipeg, Nelson, and Churchill rivers, and Rottenstone Lake .

Geodetic Survey.—Reconnaissance flights along the Canadian National railway from Senneterre to Barriere on Lake Kakabonga, from Clave to near La Tuque, and from the vicinity of Folyet to Nakina; on the Canadian Pacific railway from Sudbury to Sault Ste. Marie.

North West Territories and Yukon Branch.—Provided planes are available, aerial photography over a number of different areas in the Northwest Territories.

Department of Mines.

In co-operation with the Topographical Survey, Department of the Interior, vertical aerial photography to complete work started last year in areas in Cape Breton Island, Novia Scotia; in New Brunswick; and in Manitoba, together with a small operation in the Rottenstone Lake area.

Department of Public Works.

To assist in dredging and other operations in Kootenay district of British Columbia. Vertical photographs have already been taken in the vicinity of Arrow Lakes and Kootenay Lake

An area also in the vicinity of Prescott is being photographed in connection with port development. It may be mentioned that vertical aerial photographs reveal underwater features which assist in laying out such projects.

Department of Agriculture.

Experimental dusting for the prevention of wheat rust in the Prairie Provinces, and for the control of the spruce budworm in the Sudbury district. In co-operation with the Ontario Government Air Service, the control of hemlock looper in the Muskoka district.

Provincial Services.

In addition to the work of the R.C.A.F. extensive programmes are being carried out by Provincial Governments and private interests. The Province of Ontario operates its own Forestry flying service and during the period of fire hazard, detection and suppression patrols are carried on throughout northern Ontario. Forest type sketching is also carried out on a large scale, as well as exploration in the district of Patricia. This work each year, on account of mining and other developments, is being extended farther and farther north.

In Quebec and British Columbia the work is undertaken by commercial companies, under contract, for the respective

INTERFERENCE.—Churchill River, N. Manitoba, on a non-photographic day.

Provincial Governments. Much transportation of survey parties on the north shore of the gulf of St. Lawrence is done by aircraft. A large part of Gaspé has now been photographed. Air patrols for forest fire protection will be continued in British Columbia.

COMMERCIAL SERVICES.

At the present time there are 44 commercial operating companies in Canada. Their activities extend into all parts of the Dominion and include forest fire patrols, timber cruising, air photography, passenger, express and mail transportation, instruction, and other related services.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day.—Sunday, 23; Monday, 39; Tuesday, 45; Wednesday, 51; Thursday, 44; Friday, 40, Saturday, 46.

EUROPEAN AIR MAILS.

The Postmaster-General announces that the first morning air service to Holland, Germany, Austria and other Central European countries has been discontinued. Air mails for these countries now close at 07.00 hours instead of 03.30 hours.

A SOUTH AFRICAN AIR MAIL.

The Postmaster-General announces that the South African Post Office has notified that a new Air Mail Service has been established between Cape Town, Port Elizabeth, Johannesburg and Durban in connection with the arrival and departure of the Mail Packets to and from this Country. The service will begin with the Mail due to leave this country on Aug. 9.

The new service will accelerate the transmission of correspondence for Port Elizabeth, East London, Durban, Bloemfontein, Johannesburg, Pretoria and surrounding districts, and extend the time in which replies can be sent by the return mail ship. The gain in time is about 1 day for Port Elizabeth, Bloemfontein, Johannesburg and Pretoria and 1-2 days for East London and Durban.

The air fee payable on packets sent by the new service is 4d. per ounce, in addition to the ordinary postage.

Packets intended for conveyance by the new air service may be posted in any of the ordinary ways of posting, up to the usual time of closing for the South African Mail. They should bear the usual blue air mail label, of which supplies are obtainable free of charge through any Post Office.

CATAPULTING MAILS.

The French steamship *Ile de France* will carry an aeroplane during all her future trips across the Atlantic, so as to maintain a ship-to-shore mail service. The aeroplane will be catapulted from the ship when it approaches the coast, and in time to allow the mail to be delivered 24 hours ahead of the normal service. The machine, which is a seaplane, will alight in the harbour in New York and on the Seine at Suresnes, near Paris.

SAUNDERS-ROE LTD.

The firm of S. E. Saunders Ltd. have announced the alteration of the company's name to Saunders-Roe Ltd., thus linking together two names which have been associated with aviation since the earliest days.

Sir Alliott Roe made the first flight on a British-built machine and was one of the founders of the firm of A. V. Roe and Co. Ltd., now acquired by the Armstrong Siddeley Development Co. When the firm changed hands Sir Alliott Roe and Mr. John Lord joined S. E. Saunders Ltd.

S. E. Saunders Ltd. built the hull for the Sopwith Batboat, which was the first successful amphibian flying-boat in the country, and have been connected with the aviation industry ever since, chiefly in the production of flying-boats.

The linking together of the marine experience of Mr. S. E. Saunders and Sir Alliott Roe's experience of aviation should be of considerable advantage to the aviation industry of the country.

A new departure for the firm is the production of a small flying-boat for the private owner, and the firm's first essay in this type was the Cutty Sark, shown at the Aero Show.

GOOD THINGS FOR CANADA.

Readers of THE AEROPLANE in Canada will be interested to know that Mr. J. W. A. Legge-Willis, of 17, Williams Buildings, 413, Granville St., Vancouver, B.C., has been appointed agent for Canada for A.B.C. Motors Ltd., and for the Essex Fire Extinguisher. He is taking samples with him, and after reaching home he will start on a business tour Eastward.

Mr. Legge-Willis served in the Infantry during the War 1914-18 and later joined the R.F.C. The authorities refused to pass him for flying, so he became a kite-balloon officer and as such served for a long period in France.

A.B.C. Motors Ltd., who during the War were turning out high-power radial engines, which had not been fully developed at the end of the War, have of late made a considerable name for themselves as builders of engines for very light aeroplanes. The little 2-cylinder A.B.C. Scorpion, although it is not of a type which can be used for any commercial purpose, has done very good work in competitions, and is eminently suitable for single-seat light aeroplanes, or even very light 2-seaters, for purely sporting purposes. But the firm has recently developed the Hornet, a 4-cylinder double-opposed horizontal engine, which will give all of 80 h.p., and should, when it has been properly tried-out in suitable aeroplanes, give a very good account of itself. It strikes one as being particularly suitable for a twin-engined pusher light aeroplane, when anybody has the enterprise to build such a machine.

The Essex Fire Extinguisher has only recently become prominent in the Aircraft Trade. The moving spirit in the firm which is marketing it is Mr. Leigh Mossley, who was well known until recently as a Director of the Supermarine Aviation Works Ltd. Besides the Fire Extinguisher the firm makes various tools which are of considerable importance to aerodromes and aircraft works.

Between the two firms Mr. Legge-Willis has some very marketable goods to offer to aviation interests in Canada. The Essex Fire Extinguisher and the other tools sold should soon find places in every aeroplane shed in the country, whether it be that of a club or of an operating company or service station or of a manufacturing concern. And the A.B.C. engines should find a ready market among those people in Canada who have the pluck to start building aeroplanes.—C. G. G.

Hanworth...

the modern Country Club.

Open in September.

HANWORTH, the first unit of National Flying Services, functions not only as the headquarters of the Company's operating system, but as an unique social centre for everybody interested in flying. Here is provided a luxurious club house situated in delightful wooded gardens, which, in turn, are surrounded by the London Air Park of the N.F.S.; the whole extending over an estate of 230 acres.

Besides giving every facility for flying . . . . and learning to fly . . . the amenities of the Club will includ tennis and racquets courts, a ballroom, lounges, dining-room, card and writing rooms, in addition to first-class residential accommodation.

At Hanwo th. which opens officially a few weeks hence, N.F.S. members will find recreation and relaxation amid ideal surroundings . . . . . and Hanworth is only 30 minutes by road from Hyde Park Corner.

ENROL NOW.—*A limited number of members are now being admitted to the Hanworth Club at the following rates: Flying members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-Flying members, 3 gns. in each case For this year, two-thirds of the annual subscription is rebated. Membership of the Hanworth Club confers Honorary Membership of all other N.F.S. Clubs. Write to-day for the N.F.S. brochure detailing the services offered to all who wish to fly.*

CAPTAIN ACLAND'S ACCIDENT.

His many friends will regret to hear that Capt. P. D. Acland, lately Chairman of the S.B.A.C., had a serious accident last week while staying with friends at Beaconsfield. He fell out of a window some ten feet to the ground, and broke a wrist, besides injuring himself internally. He is in the Empire Nursing Home, Vincent Square, S.W.1, where he is doing as well as can be expected, but is not yet able to see visitors.

PERSONAL NOTICES.

BIRTHS.

BUTLER.—On July 9, at a nursing home, Barnsley, to Doris, widow of Flg. Off. Leonard Butler, A.F.C., R.A.F.—a son.

COMPER.—On Aug. 7, at 71, Beulah Hill, Norwood, to the wife of Adrian Comper—a daughter.

ELLIOT.—On Aug. 12, at 6, Hampstead Way, N.W.11, to Nancy, wife of Sq. Ldr. K. Riversdale Elliot, R.A.F.—a daughter.

MARRIAGES.

BIRD—BECKINGHAM.—On Aug. 10, in London, James Bird, Sq. Cdr., R.N. (Retired), to Yolanda Claire, twin daughter of Mr. and Mrs. E. L. Beckingham, of Tynemouth, Northumberland.

The Sunday Times of Aug. 11 states:—

Commander James Bird, R.N. (Retired), Vice-Chairman of the Royal Aero Club Schneider Committee, was married in London yesterday to Miss Claire Beckingham, well known in lawn tennis circles as one of the "Beckingham Twins."

Commander Bird is a director of Messrs. Vickers' Aviation, Limited, and the Supermarine Aviation Works, Limited. He was responsible for the production of the Supermarine-Napier S5 machines, which were first and second in the Schneider Trophy race at Venice in 1927, and so recaptured the trophy for England.

The bride, who has often played in the tennis championships at Wimbledon, has been the holder of many singles championship cups, has represented England internationally, and has for several years helped to keep Durham in the first inter-county group. Many women's doubles events in English tournaments were won by the "Beckingham Twins."

NICHOLL—THATCHER.—On Aug. 7, at Wishford, Salisbury, Patrick Edward Nicholl, R.A.F.O., to Josephine Thatcher.

PIDCOCK—WATKIN.—On July 25, Geoffrey Arthur Henzell Pidcock, Flt. Lt., R.A.F., to Evelyn Catherine Watkin, 35, Moore Street, S.W.3.

VIGERS—VIGERS.—On Aug. 10, at St. Mary's Church, Kippington, Capt. Arthur W. Vigers, M.C., D.F.C., youngest son of Mr. and Mrs. Vigers, of Montville, Guernsey, to Marjorie Frances, eldest daughter of Mr. and Mrs. Chas. H. Vigers, of Kippington House, Sevenoaks.

FORTHCOMING MARRIAGES.

DESMOND—FRASER.—A marriage has been arranged, and will take place quietly in October, between Flt. Lt. T. J. Desmond, R.A.F., and Elsie, only daughter of the late Colonel and Mrs. Fraser, of White Cottage, E. Cowes, I.W.

GRACE—HEWITT.—The engagement is announced between Charles Frederick Hallyburton Grace, R.A.F., son of the late Major C. H. Campbell Grace, Indian Army, and Irene Mary, elder daughter of Mr. and Mrs. J. Roland Hewitt, of Foxhall, Ipswich.

ON OUR INTERNATIONAL CHALLENGE.

For once in a way we in this country can be really proud, without any qualification, of an all-British performance in a great international competition. Let us hope that two or three weeks hence we may be equally proud about the result of the Schneider Trophy Contest. But even if we are, we ought to be still more proud of the extraordinarily fine performance of Miss Winifred Spooner and Mr. Hubert Broad in their Gipsy Moths in the great *Challenge Internationale de Tourisme*. They have un-aided thrown out an international challenge where light aeroplanes are concerned.

They were the only two British competitors with all-British equipment out of forty-five starters from Orly. They led the field the whole way through. And if they had not been compelled by the rules to stop until a certain stated time at two or three of the intermediate stopping places, they could have finished at Orly on Sunday of last week, Aug. 11, and nobody else would have been within days of them.

On actual speed over the course they have both been beaten, but only by machines which had any amount of work done on them stage after stage. In fact the machine credited with the fastest time over the course might almost be said to have been rebuilt at the various stopping places.

Actually the fastest time over the course, taking it stage by stage, was 155 kilometres per hour. This was done by Lord Carbery in his Raab-Katzenstein with a Hermes engine. He had endless trouble on the way. Oil pipes broke, petrol pipes broke, cowling cracked, and at one point a fuselage strut broke and a part of the fuselage had to be stripped so that it could be welded. During one stage he had to land three times. The fact that his British Cirrus-Hermes engine stood up to such a gruelling is splendid testimony to the design, workmanship and material of our latest aero-engine, for it came through undamaged in spite of over-heating caused by strange cowling.

Mr. Broad's speed over the course, stage by stage, was 154 km.p.h. He was running his Gipsy engine at 2,000 r.p.m., and he never so much as changed a sparking plug throughout the journey.

Third and fourth fastest time was done by two of the Italian Romeos. Their speeds were 148 km.p.h. and 146 km.p.h.

Miss Spooner's Performance.

The fifth fastest time was Miss Spooner's,—145 km.p.h. She replaced one plug, not because it was needed but because her mechanic felt a little doubtful about it.

She was the only woman in the race. Her machine is by no means new, for she has flown it in a number of competitions over here and has used it for ordinary joy-riding. She was always a little behind Mr. Broad on each stage, but she always fetched up at the same place every day, and they finished within a few seconds of one another. Also Mr. Broad's machine had a very low coupé top, and Miss Spooner's is of the ordinary open type.

The reason that they were not in the first two or three landing at Orly was that they under-estimated their speed from Brussels to Orly, arrived a little ahead of time and had to cruise round for two or three minutes before crossing the line.

Miss Spooner is the first woman pilot to figure prominently in an international competition of the first importance, and her performance definitely places her among the World's best pilots of light aeroplanes irrespective of sex. Which only shows how foolish the *Fédération Aéronautique Internationale* was in allowing itself to be jockeyed into creating a special category of records for women pilots.

Unofficial Results.

The final official results of the competition will not be known until after The Aeroplane has gone to press this week. But a telegram from Mr. Broad from Paris on Monday gives the results unofficially as follows:—

The first place goes to Herr Morzik, of the Deutsche Verkehrsfliegerschule, in A4, a B.F.W. M-23 (70 h.p. Siemens S.H.-13).—This machine is in the light category and probably wins the competition on its points for petrol consumption, as it never showed up prominently during the actual flying. Nevertheless the B.F.W. is, in the very light class, a good little aeroplane.

The second place goes to Mr. Broad, in H35, a Coupé Moth (Gipsy). He is thus the winner in the heavier class. And, as the heavier class of light aeroplane is definitely the class which is best suited for general use all over the World for touring and taxi work and school work, this highly satisfactory result definitely proclaims the Gipsy-Moth the champion light aeroplane of its time.

The third place, apparently, goes to Lord Carbery, in B3., Raab-Katzenstein (Hermes) — presumably on speed. In the marking of various points of utility and efficiency awarded before the start of the tour his machine was at the very bottom of the list and was only awarded twelve marks, as against 26.25 marks awarded to Mr. Broad's Coupé-Moth, and 22.5 marks awarded to Miss Spooner's Gipsy-Moth. How he managed to pick up so many places in the

A GALLANT EFFORT.—The Hon. Lady Bailey re-fuelling her Moth at Berlin.

final classification when his speed was only one kilometre per hour faster than Mr. Broad's, is something of a mystery.

Nevertheless, Lord Carbery does deserve full credit for his pluck and perseverance in carrying on to the finish in spite of all the trouble he had, and all the repair work he had to do at the stopping places. And, in common justice one must admit that his machine was built purely for speed. It had a racing undercarriage which must have shaken it badly every time it landed, and the structure was obviously light for its powerful Hermes engine. Also it was built in a hurry, the only one of its kind, so that it was in every way an experiment, and one can hardly blame the makers because it tried to shake itself to pieces in the course of the journey.

All the same, if marks had been awarded for reliability throughout the journey, as undoubtedly they should be in any competition which is not a race pure and simple, the machine would have been disqualified for needing so many repairs. And if the competition had been a straight race round the course, allowing the competitors so many hours per day, the two Moths would, as already stated, have finished days ahead of anything else, including Lord Carbery, for he would have been left behind doing repairs.

Lady Bailey's Flight.

Following hereafter will be found notes on the progress of the race, including one from a correspondent in Vienna and one describing the finish at Orly. In all these the excellence of the performance of the Moths is duly indicated. And, just by way of showing that their performance was no fluke, we have confirmation in the very fine sporting flight made by the Honourable Lady Bailey round the course in a brand new Moth.

As was stated in the first article on this competition Lady Bailey arrived unfortunately too late to have her machine accepted as a competitor. So, true to her record for sportsmanship, she flew round with the rest. And she finished with the rest. So far as can be gathered, her Moth needed no more attention than did either of the other two.

Our Engines.

We British have yet another reason to be pleased with the result of this competition. Forty-five machines left Orly on Aug. 7. Among them they had five Genet engines, five Cirrus engines, three Gipsies and one Hermes.

In the first twenty-five machines which finished were three out of the five Cirruses, two out of the three Gipsies, and two out of the five Genets and the one Hermes. Allowing for the machines which were put out of action by sheer accident or bad piloting or by any one of a dozen other causes, and considering that there were only fourteen British engines in forty-five starters, this is an extraordinarily good show for British engines.

None of the foreign machines with British engines was stopped by failure of its engine. Not only the manufacturers, but Mr. Olney of the Cirrus, and Mr. Sleigh of the Armstrong Siddeley Co., who saw to the installation of the engines at Orly, deserve full credit for their good work.

Our Manufacturers.

The great pity is that more British manufacturers did not see the wisdom of competing in this great international event. Several of our private owners would have liked to have been in it, but the majority of them have to work for their livings, even though they make enough out of doing so to be able to afford aeroplanes of their own. Therefore the only hope of the British Aircraft Trade being adequately represented was that the Trade would see the advertising value of such an international competition. Unfortunately, as usual, our salesmanship was not up to our workmanship, and so the only British aeroplane in the competition was the Moth.

The De Havilland Co. thoroughly deserve the enormous international advertisement which they will get out of the performance of their two lonely representatives. Whatever the marks may show, they have undoubtedly put up the best show in the whole competition. And they have worthily upheld the reputation of British design, British workmanship, British material and British sportsmanship.—C. G. G.

ON THE WAY.—Miss Spooner and Mr. Cambpell, her mechanic (right), at Basle.

THE BRITISH CHAMPION.—Mr. Broad getting ready to start from Orly.

A General Resume.

A brief resumé of the progress of the tour of Europe from the time that the competitors left Orly was given in The Aeroplane last week. At that time the results of the eliminating tests were not available so that it is now necessary to return to the preliminaries, now that the results are known, in order to be able to appreciate the final results of the Competition, which should be announced some time during the coming week.

As is already known, fifty-five machines arrived at Orly, of which eight were eliminated for various reasons, leaving forty-seven "toeing the line" for the Competition. These machines had first to be submitted to a number of preliminary tests for which a maximum of 46 points could be gained before starting on the Tour of Europe.

These tests resolved themselves into examinations of the machines to determine (1) the robustness of construction and comfort of the crew, (2) the arrangements for dual control, (3) the arrangements for the installation of parachutes, (4) the arrangements for protection against fire, (5) engine-starting, (6) the arrangements for dismantling and re-erection, and finally (7) the fuel consumption over a circuit of 320 kms.

For robustness of construction and comfort of the crew the three Potez 36 cabin monoplanes obtained the maximum 5.75 points followed by the Junkers Juniors (Genet engines) and the Breda 15 cabin monoplanes (Cirrus engines) with 5.5 points and the Guerchais-Henriot cabin monoplane and the Coupé-Moth (Gipsy engine) with 5.25 points.

For dual-control arrangements the Fiat A.S.1 monoplanes obtained the maximum 1.75 points, these being followed by the Romeo Ro.5 monoplanes with 1.5 points. Six machines —the two Raab-Katzenstein R.K.25 monoplanes, the Caudron 190 and 191 and the two Belgian St.-Hubert monoplanes— had no dual-control fitted.

All machines without exception carried parachutes. The Darmstadt D.18 (Genet engine), the Cirrus-Klemm, the three Junkers Juniors (Genet engines), the three Breda 15 cabin monoplanes (Cirrus engines) and the two Avia Antilopas were awarded the maximum 1.5 points for providing the best means for using their parachutes.

For protection against fire the Junkers Junior, Romeo Ro.5 and Breda 15 monoplanes were awarded the maximum 3.75 points.

For engine-starting all the Salmson-engined Klemm monoplanes, the Guerchais-Henriot and the two Potez 36, all fitted with the 95 h.p. Salmson engine, the Cant (Isotta-Fraschini) and the two Avia Antilopas (Walter engines) were awarded the maximum three points.

In the dismantling and re-erection tests the two Gipsy-Moths gained the maximum five points by shutting and opening themselves in 22 and 30 seconds respectively. Thirteen machines were not fitted with dismountable wings.

The fuel consumption test was the most important in that unlike the other tests, it was eliminatory. Forty-seven machines lined up for this test. Eight machines were eliminated and two exceeded the maximum consumption figure and repeated their tests under a penalty of a fifty per cent. reduction of their final classification.

The eight eliminated machines were the B.F.W.23, piloted by Herr Sido, for excessive consumption, the two Potez 36 piloted by MM. Laulhé and Roques respectively for landing during the tests, the B.F.W.23 piloted by Herr von Bismarck for engine trouble during the tests, the Focke-Wulf Kiebitz piloted by Herr Kissin, the Arado cantilever biplane in which Herr Hoffmann was killed and the Yougoslav Icarus biplane for having an unsuitable airscrew. The two machines to repeat their consumption tests were the Caudron piloted by M. Delmotte and the Romeo Ro.5 piloted by Signor Benassati.

The fastest speed over the circuit was made by Lord Cadbery in the Raab-Katzenstein R.K.25 monoplane (Cirrus Hermes engine) at 174.171 km.p.h. with a consumption of 47.196 kgs. of fuel. The lowest consumption figure was o

tained by the Swiss M. Wirth in a Klemm-Salmson with 20.176 kgs. at an average speed of 109.533 km.p.h. All the Klemm-Salmson monoplanes showed extremely low consumption figures, the highest being that of the other Swiss competitor, M. Burkhard with 28.132 kgs. and an average speed of 116.326 km.p.h. The biggest variation between two machines of the same type was that of the two Romeo Ro.5's piloted by Signors Guazzetti and Benassati. The former's consumption figure was 37.749 kgs. and that of the latter 62.921 kgs. Both averaged 155 odd km.p.h.

The following gives the order of the competitors in the classification on points gained in the eliminating tests:—

		Points.
1.	Wirth (Klemm-Salmson 40 h.p.) *S-2	32.5
	Kleps (Avia-Walter 85 h.p.) T-1	
	Nehring (Darmstadt-Genet 65 h.p.) *B-5	
4.	Lusser (Klemm-Salmson 40 h.p.) *C-2	30.5
5.	Poss (Junkers-Genet 80 h.p.) *C-6	30.25
	Roeder (Junkers-Genet 80 h.p.) D-5	
7.	Siebel (Klemm-Salmson 40 h.p.) *C-5	30
8.	Risticz (Junkers-Walter 85 h.p.) D-7	29.75
9.	Kneer (Junkers-Genet 80 h.p.) D-4	29.5
	Hirth (Klemm-Salmson 40 h.p.) *C-1	
11.	Vleck (Avia-Walter 85 h.p.) T-2	29
12.	Guazzetti (Romeo-Fiat 80 h.p.) M-3	28.25
13.	Kirsch (Klemm-Cirrus 80 h.p.) C-4	27.75
14.	Stoppani (Cant-Isotta-Fraschini 80 h.p.) K-7	27.25
15.	Broad (Coupé-Moth-Gipsy 85 h.p.) H-5	26.25
	Novak (Aero-Walter 85 h.p.) T-4	
	Ferrarin (Breda-Cirrus 80 h.p.) M-4	
18.	Castaldo (Romeo-Fiat 80 h.p.) M-2	25.25
	Junck (Albatros-Siemens 70 h.p.) B-9	
20.	Thomas (B.F.W.-Genet 80 h.p.) *A-1	25

	Suster (Fiat-Fiat 80 h.p.) K-5	
	Donati (Fiat-Fiat 80 h.p.) K-4	
40.	Botalla (Fiat-Fiat 80 h.p.) K-6	17.5
41	Vuylsteke (St.-Hubert-Walter 85 h.p.) H-3	15.75
42.	Croneiss (B.F.W.-Genet 80 h.p.) *A-5	15.25
43	Lemerre (Guerchais-Salmson 95 h.p.)	15
44.	Offermann (B.F.W-Siemens 70 h.p.) *A-2	14
45.	Delmotte (Caudron-Salmson 95 h.p.) E-7	12.75
46	Lord Carbery (Raab-Katzenstein-Hermes) B-3	12
	Altemeier (Raab-Katzenstein-Cirrus 80 h.p.) B-2	

Of the forty-seven competitors who survived the eliminating tests, forty-five left Orly on Aug. 7 to take part in the European tour.

The two non-starters were Herr Risticz (Junkers-Walter) whose undercarriage failed while he was taxy-ing from the hangar to the starting line and M. Vuylsteke (St.-Hubert-Walter) who suffered persistent magneto-trouble.

Of the starters M. Barbot (Caudron-Renault), M. Novak (Aero-Walter) and Signor Donati (Fiat-Fiat) gave up soon after starting with engine trouble. Barbot and Donati returned to Orly.

Up to Aug. 11, of the departures from Orly, forty-two had been checked in at Basle, forty-one at Geneva, forty at Lyon, thirty-nine at Marseilles, thirty-eight at St. Raphael, thirty-seven at Turin and Milan, thirty-five at Venice, thirty-two at Zagreb, thirty at Belgrade, twenty-five at Bucharest, twenty-one at Budapest, sixteen at Vienna and fourteen at Brunn, Prague and Breslau.

On Aug. 12 there were still thirty-four competitors left in the contest, strung all over Europe from Bucharest to Amsterdam. Herr Nehring, who was one of the three to score highest points in the eliminating tests, was forced to land in Poland and his machine was wrecked. Herr Nehring was flying a very interesting cantilever biplane which had been designed and built by the students of the Darmstadt University, and this machine had attracted considerable attention by reason of its originality in design and excellence of workmanship.

On Aug. 13 those competitors who had arrived at Amsterdam continued to Brussels. Mr. Hubert Broad (Coupé Gipsy-Moth) was the first to arrive at Brussels at 08.20 hrs followed by Lord Carbery (Raab-Katzenstein-Hermes) and Miss Spooner (Gipsy-Moth) at 08.22 and 08.23 hrs. respectively.

They were followed by Herr Roeder (Junkers-Genet), Herr

Offermann (B.F.W.-Siemens), M. Delmotte (Caudron-Salmson), Herr Hagenmeyer (Klemm-Siemens), M. Kleps (Avia-Walter), Signor Lombardi (Fiat-Fiat), Signor Botalla (Fiat-Fiat), Signor Mazzotti (Breda-Cirrus), Herr Van Dungern (B.F.W.-Siemens), Herr Morzik (B.F.W.-Siemens), Herr Junck (Albatros-Siemens) and Herr Kneer (Junkers-Genet).

The Hon. Lady Bailey, who had gone round the course *hors concours*, was the last to arrive at Brussels that day. after having overshot Evère aerodrome and landed in a field to inquire the way.

15.00 hrs. on Aug. 14 was the zero hour for arrivals at Orly. Any competitor who arrived before that time and flew round, over, or in the vicinity of, the aerodrome, was liable to have his waiting time added to his flying time from Brussels to Paris and would thus penalise himself. Soon after 14.30 hrs. two Junkers monoplanes appeared over the aerodrome and they were closely followed by other German machines. At 14.58 hrs. the two Gipsy-Moths arrived and at 15.00 hrs., precisely, a rocket was fired to signify that landings would be permitted. Following this signal fifteen competitors crossed the line within two minutes and by 18.00 hrs. twenty-five competitors had landed.—L. B.

At Vienna.

A correspondent writes from Vienna:—

Machines arrived in the following order, on Aug. 10, Raab-Katzenstein (Hermes) Lord Carbery, 10.00 hrs.; Moth (Gipsy) Miss Spooner, 10.43; Moth (Gipsy) Mr. Broad, 10.51; Klemm (Cirrus) Kirsch, 10.59 hrs.; Darmstadt Akad. (Mk. I Genet) Nehring, 11.56; Avia (Walter) Klepps, 11.25; B.F.W. (Siemens) Offermann, 11.26; and Caudron (Delmotte) 12.00 hrs.

All save Nehring filled up and went on to Prague. The latter decided to wait until Sunday, the 11th. Three Fiats and four Romeos which arrived during the afternoon, also waited until Sunday morning as did Roeder (Junkers-Genet) who arrived just before the Italian machines. They decided to do this owing to the increasing force of head wind and bad weather reports.

The exact position of competitors in this competition is not necessarily indicated by the arrival times. Points were awarded in Paris for fuel consumption and design, etc. Points gained for average speed while actually flying will be added together.

AN INTERNATIONAL JOKE.—Herr Offermann at Schiphol, Amsterdam, reading his obituary in "The Aeroplane," while Mr. Broad, and Mr. Smits of the Fokker Co. (extreme right) enjoy the mistake.

FORCE OF HABIT.—Lord Carbery (right) looking for the cause of trouble in his R.K. monoplane.

The Raab Kat machine (Cirrus II), Altemeier pilot crashed within 10 kms. of Venice on Thursday, through fuel stoppage when holding 2nd Position,—machine destroyed, no injuries to pilot or mechanic.

Lady Bailey left Vienna this morning just after the Darmstadt (Genet) and the Junkers (Genet). She is flying the course round but not as a competitor. The B.F.W. (Siemens) von Dongern pilot, arrived late on the 10th.

This morning, 11th, against a strong head wind, arrived two Klemm (Salmson 40 h.p.) an Albatros (Siemens) and Junkers (Genet) Kneer, pilot.

All competitors are unanimous in expressing their appreciation at their reception in all places. Oil and fuel and timing arrangements are first class.

The Competition, for a "first timer," that is to say for an International one of such a size, covering so large an area and so many countries, is so far apparently very successful.

The Grand Finale.

A correspondent in Paris describes the final scene:—

Amid blazing sunshine and in heat such as has not been known for weeks, the competitors in the *Challenge Internationale de Tourisme* returned home yesterday (Aug. 14). Since leaving on Aug. 7, just a week ago, they have flown over the greater part of Europe and visited 23 of the chief cities: and of the 46 that left more than 50% have completed the course within two and a half hours of the first machine home.

One arrived before two o'clock to find already a small crowd of officials and general public. The control was not open till 3 p.m. and it was known that the departure from Brussels had been arranged to ensure an arrival at Orly exactly at 3 o'clock.

The time of waiting was beguiled by avoiding the attentions of too-flirtatious wasps, by sedulously seeking the few cool spots, and by resisting a strong inclination to lie on the grass and close one's eyes for a minute. At 2.30 a faint spasmodic interest in the heavens was observable. The sky was quite empty; not a speck, not a sign of anything; not even a tiny cloud. Only a hot lazy sun. Suddenly at 2.40 the first 'plane arrived, coming from behind the aerodrome and taking one quite by surprise. It flew low and triumphantly over the arrival line and went off to amuse itself for 20 minutes. It was followed immediately by another, and for five minutes these two held the sky alone. Then they all came. At 3 o'clock there were 16 planes circling round and round over the aerodrome.

To one more or less an amateur, it was a beautiful sight to see these 16 machines dancing in and out, flashing silver in the sunlight, forming a crazy pattern in the sky and avoiding each other, as it seemed, only by miracles. They seemed like giant dragon-flies, darting past and roaring over the line of arrival. At one minute past three the first an Italian machine, piloted by Lombardi, touched ground. At two minutes past the hour 16 planes had landed and the occupants were being rapturously greeted.

These planes had left Orly seven days ago; they had flo

Digitized by Google

right round the Continent of Europe and they had landed back in Orly within one minute of each other. And in the crowd that greeted them was Monsieur Blériot.

Order of Arrival.

The planes that arrived during the first two minutes were, in order of precedence, the K-3, A-2, D-4, F-5, B-3, H-6, D-5, C-5, C-2, E-7, A-3, C-6, T-1, C-4, and H-5; that is to say, nine German, two Italians, four French, and one Czechoslovakian. The two English machines were (as already stated a fortnight ago) flying under the auspices of the Aéro Club de France. They were followed immediately by A-4 and B-9, both German machines, two minutes later.

One had ample time in which to greet these arrivals, examine their planes and hear the hazards of the voyage before the appearance of the other machines. The Italian Breda, the M-5, came in at 3.40 p.m., to be followed just before 4 o'clock by that splendid equipage of Italian Romeos which had flown the whole course without one of the four constituent planes being separated from the others.

There was some small excitement when they landed, for two, at least, of the four, had not understood, or had forgotten, that it was necessary for them to pass the arrival line while in actual flight. However, as the arrival, registration of dismay, taking-off again, and rectification of the mistake only occupied about one minute it did not matter.

The second Potez 36 to arrive appeared at 4.15 p.m. and at 5.50 p.m. the long-expected M-6, an Italian Breda, showed up, —greatly to the satisfaction of the Italian contingent.

Hereafter is appended the official list, as issued by the Aéro Club de France, giving the competition mark, the type of machine, pilot, and time of arrival:—

K-3	A.S.1 (Fiat)	Lombardi	3.01 m.
*A-2	B.F.W. (Siemens)	Offermann	3.01 m.
K-6	A.S.1 (Fiat)	Botalla	3.01 m.
D-4	Junkers (Genet)	Kneer	3.01 m.
F-5	Potez 36 (Salmson)	Weiss	3.01 m.
B-3	Raab-Katzenstein (Hermes)	Carbery	3.01 m.
H-6	Moth (Gipsy)	Miss Spooner	3.01 m. 4 s.
D-5	Junkers (Genet)	Roeder	3.01 m. 8 s.
*C-5	Klemm (Salmson)	Siebel	3.01 m. 14 s.
*C-2	Klemm (Salmson)	Lusser	3.01 m. 20 s.
E-7	Caudron (Salmson)	Delmotte	3.01 m. 25 s.
*A-3	B.F.W. (Siemens)	Von Dungern	3.01 m. 30 s.

M-2	Romeo (Fiat)	Castaldo	4.00 m. 21 s.
M-3 F-6	Romeo (Fiat)	Guazzetti	4.02 m. 18 s.
F-6	Potez (Salmson)	Finat	4.15 m. 21 s.
M-6	Breda (Cirrus)	Liberrati	5.50 m. 00 s.

(Asterisks denote the light category.)

Nationality Will Out.

I think if one had been deaf and also entirely ignorant of aircraft construction one could have told the nationality of each machine as it arrived by the behaviour of its occupants. The French, so gay, jolly, and glad to be home again, with "*Le Voila!*" "*Eh, bien!*" "*Magnifique!*" in quick succession from all sides; the Germans, smiling and contented, not saying much, and all looking dusty, hot, and tired, in marked contrast with the other nations, especially the French and English, but obviously very pleased with themselves—as well they might be, considering the number of their planes that stayed the course: the Italians laughing and talking all at once, frightfully excited, and full of "*Viva-s*" and "*Bravissimo-s*" and more warmly welcomed by their compatriots than any of the other participants: the English distributing a few casual "Hello-s" and then stretching out on the grass for cigarettes and a rest, so well hidden behind their machines that many thought they had not yet arrived. This contrast between the different nations was most marked.

Very full credit must be given to the performance of Miss Spooner. The only woman entrant, she stayed a course of nearly four thousand miles and came in two minutes after three o'clock looking fresher and far less tired than the majority of the men. The tremendous strain of such a test, flying over seven hours a day—and in this connection one remembers vividly a young German tenderly rubbing his seat on dismounting—under all conditions would be too much for many men, and it is amazing that any woman could stand it. Congratulations to her on her splendid performance.

That fine sportswoman, Lady Bailey, although disqualified for arriving late on the day of the start, flew the whole course with the competitors and arrived back at Orly at midday. After being present at the finish of the race she left immediately for Croydon.

Mr. Broad and Miss Spooner on being pressed for an account of their experiences, murmured vaguely about difficulties of obtaining adequate food, perilous crossings of the Danube, and referred to bed bugs and such like. They did not seem to have much else to say of Europe.

Among Those Present.

A reception was held afterwards when the majority of the competitors had arrived. There were present, Monsieur P. E. Flandin, Vice-President of the Chambre de Députés and President of the Aéro Club de France; Monsieur Vivant, representing Monsieur Laurent Eynac, the Air Minister; Monsieur Soreau, Vice-President of the Aéro Club de France; these gentlemen representing French interests: and the General Piccio, Air Attaché at the Italian Embassy representing Italian interests. British support was conspicuous only by its absence. Mr. St. Barbe, of the De Havilland Company came over and was very pleased with the performance of the two De Havilland planes. One noticed several aeroplane designers, among them Herr Klemm.

Undoubtedly it was the constructors' day and to them was the triumph. The *Challenge International de Tourisme* can never be considered purely as a sporting event because so much depends on the actual constructors.—V. G. W.

AT THE FINISH.—M. Pierre Etienne Flandin (President of the Aéro Club de France) and M. Blériot (in straw hat) greet Miss Spooner.

ON THE INDIAN AIR RECORD.

On August 13 Mr. C. D. Barnard, who was chief pilot in the Duchess of Bedford's historic journey to India and back, while giving a talk through the British Broadcasting Company, was understood to say "I am sorry to say it, but there is not a machine built in this country which could possibly have done this flight."

Naturally this statement struck some thousands of hearers with amazement and called forth loud protests from various people connected with aviation. The enterprising *Evening News* apparently asked the opinions of several people in the British Aircraft Trade, and they, also naturally, spoke scornfully of Mr. Barnard and his opinions.

The Evening News, which so far as one can remember has not hitherto gone out of its way to proclaim the excellence of British aircraft, actually asked an official of the British Broadcasting Company whether his firm had not power to censor a remark likely to do harm,—such as this remark was apparently supposed to do. And one cannot help thinking that if *The Evening News* had paid some attention to the splendid performances of Mr. Broad and Miss Spooner in the International Air Tour Competition it might have done more good to British Aviation than it could ever do by expressing surprise that uncomplimentary remarks about the British Aircraft Trade were not censored by some authority at the B.B.C.

Personally one reads *The Evening News* fairly regularly, but the only paragraph one can remember seeing in it about the International Air Tour was one drawing attention to the fact that Lady Bailey was flying round the course. And no information whatever was given concerning the competition or the course to which the paragraph about Lady Bailey referred.

Lady Bailey, through no fault of her own, happens to be what the daily papers consider News. And the great International Air Tour, in which the two Gipsy Moths were giving British aircraft the best free advertisement they have had for years, does not happen to be news,—even with a small n.

English Salesmanship.

That is a wonderful example of English ideas of salesmanship. There are so many people in the British Aircraft Industry who, like *The Evening News*, think that the way to sell British aircraft is to hide their defects, instead of advertising their excellence.

What knowledge of British industrialism His Royal Highness the Prince of Wales displayed in proclaiming to the world our greatest commercial fault when in a speech he asked his hearers whether our salesmanship was worthy of our workmen.

Begging the Question.

Anyhow, to return to Mr. Barnard.—According to *The Evening News*, Mr. F. Handley Page, who is now the Chairman of the Society of British Aircraft Constructors, said that Mr. Barnard's statement was absolute nonsense, and that it was so obviously incorrect that he hardly had the patience to take it seriously.

May one be permitted to ask Mr. Handley Page in what respect Mr. Barnard's statement is absolute nonsense? Although Mr. Handley Page is Chairman of the S.B.A.C., and although one is only the humble editor of a humble aircraft paper, one believes that one's knowledge of what is being produced by the various aircraft firms in this country is at least equal to that of Mr. Handley Page. And one challenges Mr. Handley Page to name a machine built in this country which could possibly have done *that particular* flight.

Remember that for that particular flight the machine had to have comfortable cabin accommodation. And it had to have reasonably high speed. And it had to be arranged so that the passengers could change places with the pilot while in the air. A search through the current issue of *All the World's Aircraft*, and a fairly good knowledge of what has been produced since the last issue of that work appeared, fails to reveal any British machine fulfilling those conditions.

According to *The Evening News* "Major" Maurice Wright, of the Fairey Company, was inveigled into saying of Mr. Barnard's statement "obviously it is nonsense to say that no British 'plane could have flown to India and back. Why, the R.A.F. 'plane flew to Karachi in 50 hours without stopping. It could have come straight back to England, too, without stopping, and so done the trip in far less time than the Duchess of Bedford."

If Squadron Leader Wright said what he is reported as having said he was obviously not concentrating on what Mr. Barnard said. Nobody denies that the Fairey Long Range Monoplane could do the trip to Karachi in less time than did the Duchess of Bedford's old Fokker. But it would not fulfil the conditions of that flight.

In the first place the only existing machine of the type could not be bought for the job at any price, as it is R.A.F. property. In the second place it could not be built to sell at anything like the price of the old Fokker. And anyhow it is not being built for sale. And these points are included inherently in Mr. Barnard's phrase "this flight."

The old Fokker is a perfectly plain commercial proposition and the Fairey Long Range Monoplane, which personally one regards as the most beautiful flying-machine ever produced, is not a commercial proposition, and is hardly likely to become so.

The Daily Telegraph, also taking up the cudgels on behalf of the British Aircraft Trade, reports Mr. Handley Page as saying that the "only machine that has flown non-stop to India was British-built, that most of the machines that have flown to India were British and that the first machine to make the flight, back in 1918, was British."

Here again Mr. Handley Page begs the question. The fact that the first machine to fly to India, a twin-engined Handley Page in 1918, was British, has nothing to do with a single-engined cabin job which enabled three people fly to India and back in comfort in 7½ days. And the fact that a number of war machines and light aeroplanes and other things have flown to India more or less successfully has nothing to do with the Duchess of Bedford's successful flight.

"An official of D. Napier and Sons Ltd." has also been lured by *The Daily Telegraph* into referring to the non-stop flight to India, by the Fairey Long Range Monoplane, which had a Napier engine.

"An official of the De Havilland Aircraft Co. Ltd." is credited by *The Daily Telegraph* with having spoken thus: "Captain Barnard's statement is probably true with the addition of the words 'at the price.' The Giant Moth, with which Sir Alan Cobham is now touring Great Britain, could be equipped to give a range of over 2,000 miles and a cruising speed of 110 miles an hour. In this form it would have done the job adequately.

"It is, however, a far larger machine than the Fokker used by Captain Barnard, and the price is necessarily considerably higher. The smaller Hawk Moth saloon could also be equipped to do the job, but this being a very recent type was unfortunately not in the production stage at the time the machine was wanted."

That answer again begs the question. There are only two Giant Moths in England. Sir Alan Cobham has one and *The Daily Mail* has the other. So one can hardly say that they are "built in this country" as a habit.

They can certainly not be bought off the hook, so to speak, as the Duchess of Bedford bought the Fokker. And anyhow they do not fulfil the condition that the pilot and his passengers can change seats when flying.

The reference to the Hawk Moth also begs the question. Very possibly it could do the journey. Possibly it could do it faster than the Fokker, but one doubts it, seeing that the Fokker had a new geared Jupiter. And there is only one of it,—so the Duchess of Bedford could not have got it if she had wanted it.

WITH BRITISH ENGINES.—Herr Altmeier's R.K.25 (B2), with a Cirrus, and Lord Carbery's R.K.25 (B3), with a Hermes, at Orly.

Anyhow one doubts whether the Hawk Moth would carry three people and enough petrol to do 1,200 to 1,500 miles at a stretch. And, so far as one knows, the three existing Hawk Moths are still in the experimental stage. One feels sure that Capt. de Havilland would not let them be used for such a venture.

The Truth.

To any ordinary individual who is not out to twist the meaning of his words, what Mr. Barnard meant was, quite clearly, that there is not a machine of a standard type, and built regularly in England, which could possibly be bought out of stock to take three people and baggage to India and back in a week.

Mr. Barnard is perfectly right. No such British aeroplane exists. But several dozen of them have been built in Holland. Quite a good few of a similar type have been built in France, though none of them have done anything worth talking about. And there are hundreds of them in America. There are Lockheeds and Ryans and Fairchilds and Stinsons and half-a-dozen more types all built by the dozen, any one of which with any one of half-a-dozen different makes of engines could have done the journey just as well as the Fokker. And the Lockheed would probably have knocked 25% off the time.

But unfortunately no such aeroplane is built in England. If anybody wants one he will have to wait while it is being built, and passed as airworthy. And when he has got it, the machine will be an experiment at his expense,—which is just how the English automobile trade lost its markets to America.

The England-India-and-back Fokker happens to be exactly the type of aeroplane which is wanted in Australia, and will be wanted soon in South Africa and all over British Africa, and will be wanted a little later in India.

For the big long-distance passenger lines we may want either three-engined ships, or at any rate twin-engined ships, which will hold their height on one engine when they have used up an hour or two of their gas supply.

There is a craze at the moment for three-engined cabin machines. But people are apt to forget that a machine with three little engines all pulling their little hearts out to try and get performance, is very much less reliable than a single-engined aeroplane with one big engine only using about two-thirds of its power.

Any three-engined aeroplane ought to climb with full load and full gas supply on any two of its engines. Any twin-engined aeroplane ought to hold its height on one engine. But such aeroplanes are not likely to be bought off the hook by private owners or taxi services for some little time to come. They are craft for the big well-financed air lines, whether subsidised or not.

On the other hand, the single-engined cabin job which can fly well within its power with full load, and has a cruising speed of about 130 m.p.h., is a marketable job, and an easily produced job. And that is precisely the type of aeroplane which is *not* built in this country.

Mr. Barnard deserves the thanks of all really far-seeing people concerned with and for the progress of British Aviation for pointing out our deficiencies so publicly and so emphatically.—C. G. G.

What Others Think.

Here is what a persistent reader of The Aeroplane thinks on the subject:—

Well done Barnard! In the silly season you have raised a hornet's nest. More, you have stirred up a perfect formicarium of formic-acid-squirting Air Correspondents.

As a leg-pull, premeditated or not, your remarks about not being able to get an aeroplane in this country for your India flight, were perfectly delightful, and hearing them broadcast to the Nations t'other night, this person was convulsed with unhallowed mirth at the thought of what the morrow would bring. H. P., usually abed by 10 p.m., would burn the midnight oil composing a counter-blast, and Stag Lane would hum with wrath during the hours usually devoted to reflection.

Hoity-toity, you gents whose names begin with H and others (coupled for alliterative reasons with the name of Harry Harper). What's it all about? What *is* it all about? Truth may be more annoying than comfortable fiction, but, Bless us and Guard us, why worry? Has anyone a guilty conscience or anything? Surely not in this Britain of ours or in the S.B.A.C.

What after all are the facts? Why, these (more or less).

McIntosh drifts along to K.L.M. casual like and remarks, "Patriotic as I am and so on, and in spite of the immense numbers of commercial aircraft in daily operation on British air lines, perfectly capable of the job I want, have you by chance some old commercial aeroplane on your air lines which will serve my purpose?"

"Why sure, Cap," says K.L.M., "we have dozens of F.VIIa planes, take your choice."

Mac takes his choice and beetles off and incidentally keeps on buying Fokkers afterwards at odd times out of sheer habit. Barnard sort of meets Mac in a temperance hotel one day, and says, says he, "Mac, ole top, wattabout your Fokker, is she for sale?"

"My dear old boy," says Mac, "she's yours, take her."

Barnard kind of flies the Duchess of Bedford to India and back, casual like, meaning no offence to Mr. Handley Page or anyone else.

Could he have got one of the numerous Gigantic Moths at the time? Probably not, if Cobham's was being used as a pulpit, and Wilson had a date with *The Daily Mail* for his.

One British designer, leaving out all reference to the actual figure in thousands of pounds, and making no mention of delivery time, remarked something to the effect that a British machine could have been found to do the job "*at a price*," and to this it is merely necessary to add—what's money to a Duchess anyhow?

The Long Range Monoplane has been compared to the poor old Fokker commercial 'plane quite a lot, but unless this person is in error (which often happens, Mr. H. P., so don't try any bullying here because we shall surrender at once), the Long Range Monoplane was a very special job and not a casual hack.

Naturally, too, Barnard only had to give Fairey a ring on the 'phone, and the Long Range Monoplane would have cancelled all other engagements to be at his disposal. Deuced unpatriotic not to have requisitioned it, what?

Poor Barnard! He never happened to notice all the many many British aircraft capable of the job and it is doubtful whether he would have heard of them at all, but for the present heaven-sent fuss. Well! Well! it has at least moved this person to a fit of rollicking mirth of unequalled value for medicinal purposes.

BRISTOL FASHION.

The Duchess of Bedford, Mr. C. D. Barnard, and Mr. R. F. Little flew from London to Bristol on August 13 in the Fokker monoplane (Bristol Jupiter engine) in which they flew to India and back in seven and a half days. The machine landed on the Filton aerodrome and the Duchess and her pilots were welcomed by officials of the Bristol Aeroplane Company and several hundreds of workpeople from the engine shops.

A Civic Lunch was given in honour of the Duchess and her companions at the Grand Hotel, Bristol. The Lord Mayor of Bristol was in the Chair. Welcoming the Duchess and her pilots the Lord Mayor said that the flight from London to India and back within a week was a striking record of courage and endurance. It opened a new era in the history of communication between this country and India. The task had called for physical endurance which any young man might have shirked. Throughout the flight the Duchess had been an active, useful and efficient member of the crew.

The chief interest in connection with the present celebrations was the fact that the engine with which the aeroplane was fitted came from Bristol. That the engine used was designed and manufactured in Bristol was a matter for congratulation. On behalf of the City of Bristol he had much pleasure in congratulating the Duchess on a record flight with which her name would be associated for all time.

The Duchess of Bedford, responding, expressed thanks for the honour that had been done to her. The flight for her two companions had been strenuous, but for herself it

had been a pleasure cruise. She had had the best of pilots, the best of mechanics and the best of engines. Like Robert Bruce they had taken their lesson from the spider and though, at first, they had not succeeded, they had tried again and spun their web across the Continents.

Mr. Barnard compared their flight with the operation of the India air route, and said that by the India air mail letters reached India in nine days. They had done the return trip in two days less. They had flown by compass most of the way and Mr. Little had never been more than one degree out. The Duchess had taken control for hours at a time.

His crowning regret was that they could not possibly have a British aeroplane. They had to buy a Fokker, as there was not a machine built in this country that could possibly do the job. They could have carried 1,000 pounds more weight on board. The Bristol engine had been ideal.

Mr. Little also replied.

AN INTERNATIONAL SEAPLANE RALLYE.

An International Seaplane Rallye has been arranged to take place at La Baule, on Sept. 14. This meeting has been organised by the French Aero Club, the Municipality of La Baule and the newspaper *Le Journal*.

La Baule is a fashionable seaside resort recently fabricated on the Bay of Biscay, 8½ miles, in a straight line, west of St. Nazaire, which is the port near the mouth of the River Loire, on the north side, at which most of the British Expeditionary Force debarked when we saved France in 1914.

There are six prizes totalling 100,000 frs. (£805) and a cup worth 10,000 frs. (£80) to be won in the Rallye, besides 100,000 frs. (£805) worth of prizes to be won in races on the following day.

The Rallye is open to entries from any country belonging to the F.A.I.

Prizes for the Rallye will be awarded on points. These will be given for distance covered and horse-power per member of the crew. In awarding points for distance notice will be taken of whether the journey was made over land, along the coast, or over water. To rank in the last category the flight must be made more than 30 km. (19 miles) from inhabited land. Note will also be taken of landings which must be separated by at least 100 km. (62 miles). Special points will be awarded to amphibians.

All machines entering for the Rallye must take-off on Sept. 14, any time after 04.00 hrs. The competitors have to cover at least 200 km. (124 miles) before reaching La Baule where they must arrive at 16.30 hrs.

The competition for the 100,000 frs. worth of prize money and the cup offered by the French Aero Club will take place on Sept. 15.

This competition will be divided into two parts. There will be a speed contest for machines faster than 400 k.p.h. (roughly 245 m.p.h.), and a handicap race. Both races will be flown over a course of 100 km. (62 miles). The fastest machine in the first category will receive 50,000 frs. (£402).

The first prize for the handicap will be 30,000 frs. (£242) and the cup offered by the French Aero Club; the second prize will be 15,000 frs. (£121); and the third prize of 5,000 frs. (£40). In the event of no entries being received for the speed contest the prizes for the handicap will be doubled.

Handicapping will be done by the Stewards after a qualifying heat has been flown on the morning of Sept. 15.

There are also some other prizes for beating the altitude record and using heavy oil fuel.

All entries must be made through the Commission D'Aviation de l'Aéro Club de France, 35, rue François Ier, Paris, before Aug. 23.

This meeting is of great importance to British Manufacturers. One gathers that the French seaplanes intended for the Schneider Contest are to be sent over the speed course.

FORTHCOMING EVENTS.

There is still much to do this year. For instance:—

Aug. 28.—The Brooklands School of Flying Show at Clacton.

Aug. 31-Sept. 1.—International Air Rallye of the Suffolk Club at Hadleigh.

Sept. 6.—Preliminaries of Contest for Schneider Trophy.

Sept. 7.—Contest for Schneider Trophy.

Sept. 14-Sept. 15.—International Seaplane Rallye at La Baule.

Sept. 21.—Rallye at Haldon (near Teignmouth, Devon).

Sept. 22.—The Bristol Club's farewell party to Filton.

Sept. 28.—Proposed date for opening the Leicester Club's new aerodrome.

Oct. 5.—Newcastle Air Pageant at Cramlington,—with R.A.F. support.

A TRIBUTE TO COCHRAN.

In order to see Mr. Cochran's revue "*Wake up and Dream*" at the London Pavilion eleven passengers left Paris at tea-time one day last week and flew to London, where they had dinner before seeing the show. They then "*returned to Paris in the first light of dawn.*"

The affair was arranged by the Piccadilly Bureau in conjunction with the Air Union.—Anyhow it was good publicity, for the newspapers seem to have used the story copiously.

THE "GRAF ZEPPELIN'S" TRIP ROUND THE WORLD.

The *Graf Zeppelin* left Friedrichshafen for Tokyo on Aug. 15 at 4.35 hours. The costs of the flight are reported to be about £25,000, which have been covered by receipts from passage money, postal charges, and sale of newspaper rights.

The *Graf Zeppelin*, which had a gross weight of 78½ tons at the start, carried 70,000 cubic feet of a gas fuel which has the same weight as air. As this fuel is consumed, it is replaced by air, thus leaving the trim of the ship unaffected. Besides this quantity of gas fuel, nearly 15 tons of petrol are carried. The petrol if necessary can be used as emergency ballast.

The airship reached Berlin at 10.00 hours, and was reported over Danzig at 15.00 hours. The Latvian-Soviet frontier was crossed to the south of Dvinsk at 21.30 hours.

The *Graf Zeppelin* passed north of Moscow, and thence followed approximately the 62 parallel of latitude, passing north of Tobolsk, and north of Lake Baikal. After reaching the coast, she turned south along the chain of Japanese islands to Tokyo. The airship reached the air-port of Kasumigaura at 16.20 hrs. and continued to Tokyo. The airship had returned and landed by 19.07 hours.

The distance flown appears to be about 6,700 miles with a flying time of about 100 hours. Favouring winds across Siberia assisted the ship to maintain a high average speed in spite of the fact that fuel was carefully economised throughout the trip.

The *Graf Zeppelin* is reported to have had 60 hours' reserve of gas fuel and 20 hours' reserve of petrol when she landed.

DISTINGUISHED VISITORS.—The Archduke Anthony Mary Francis Leopold Blanche Charles Joseph Ignatius Raphael Michael Margaret Nicetas and the Archduke Francis Joseph Charles Leopold Blanche Aldegond Ignatius Raphael Michael Vero of the House of Hapsburg-Tuscany, with Mr. Herbert Thomas, Director of the Bristol Aeroplane Co. Ltd., and Mr. C. F. Uwins, inspecting a Bristol Bulldog at Filton.

The London Gazette.

Aug. 13.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following Plt. Offs. on probation are confirmed in rank:—J. B. Mackenzie (May 9); H. C. Friday (May 25); B. W. Figgins, W. R. C. Wilkins (July 15); R. J. C. Hunt, J. C. L. Claxton, S. A. Davis, R. C. W. Ellison, D. L. Iremonger, C. N. McLoughlin, J. D. Robertson, H. E. Sales, N. W. A. Cullum (July 29).

The following Plt. Offs. are promoted to the rank of Flg. Off.:—H. B. Maugham (Jan. 8); C. E. St. J. Beamish, S. L. Blunt (June 17); W. F. Murray (July 9); E. N. V. Everett (July 13).

Flg. Off. J. A. E. Inkster relinquishes his S.S. comn. on account of ill-health (Aug. 13). The S.S. comn. of the following Plt. Offs. on probation are terminated on cessation of duty (Aug. 13):—P. S. Hession, O. W. Hoffman.

Flt. Lt. C. G. Hancock is dismissed the Service by sentence of General Court-martial (Aug. 1).

Flg. Off. D. S. Thomas is cashiered by sentence of General Court-martial (Aug. 1).

STORES BRANCH.—Flg. Off. H. J. Bamber is placed on the retired list at his own request (Aug. 1).

MEDICAL BRANCH.—Maj. R. H. Bebb, O.B.E. (Army Dental Corps), is granted a temp. comn. as a Sq. Ldr. (Dental) on attachment to the R.A.F. (Aug. 1); Flt. Lt. A. B. H. Cole (Capt., Army Dental Corps) relinquishes his temp. comn. on return to Army duty (Aug. 1).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation:—C. M. Dransfield, P. A. Jessel (July 26); E. M. Wright, G. B. Rahr (July 29); Plt. Off. on probation G. Nelson is confirmed in rank (July 21); Plt. Off. E. M. S. Spence is promoted to the rank of Flg. Off. (Aug. 6). The following are transferred from Class A.A. (ii) to Class C:—Flg. Off. J. M. Greenwood (June 24, 1928); Plt. Off. on probation C. F. Morris (Aug. 9). Flg. Off. A. G. Moon is transferred from Class A to Class C (June 1); Flg. Off. A. H. Barnard is transferred from Class B to Class C (Aug. 7).

The following relinquish their comns. on completion of service:—Flt. Lt. M. D. Nares, A.F.C. (July 26); Flg. Off. S. Turner, D.F.C. (July 13).

Appointments.

Week ending Aug. 19.

GENERAL DUTIES BRANCH.—Group Captains F. K. Haskins, D.S.C., to Air Ministry (A.M.P.), on appointment as Deputy Director of Postings, 12/8. C. H. K. Edmonds, D.S.O., O.B.E., to Station H.Q., Worthy Down, to command, 6/8. S. Smith, D.S.O., A.F.C., to No. 2 F.T.S., Digby, to command, on transfer to Home Establishment, 2/8.

Wing Commanders G. H. Bowman, D.S.O., M.C., D.F.C., to H.Q., Inland Area, for Air Staff Duties, 9/8. R. Collishaw, D.S.O., O.B.E., D.S.C., D.F.C., to H.M.S. *Courageous*, for duty as Senior R.A.F. Officer, 2/8.

Squadron Leaders G. H. Hall, A.F.C., to R.A.F. Training Base, Leuchars, 5/8. R. S. Lucy, A.F.C., to No. 101 Sqdn., Bircham Newton, 9/7.

Flight Lieutenants E. J. L. Hope, A.F.C., to R.A.F. Depot, Uxbridge, 24/7. H. L. Beatty, to R.A.F. Base, Calshot, 29/7. S. D. Scott, to School of Naval Co-operation, Lee-on-Solent, 6/8. J. A. Teasdale, to H.A.D., Henlow, 10/8. J. R. D. Goadsby, to R.A.F. Base, Gosport, 29/7. F. E. Vernon, to H.A.D., Henlow, 6/8. A. F. Scroggs, to School of Photography, S. Farnborough, 6/8. G. R. M. Clifford, to No. 406 Flight, Donibristle, 23/7.

Flying Officers G. W. Hayes, to H.A.D., Henlow, 12/7. F. S. O'Hanlon and A. C. Danbury, to H.A.D., Henlow, 11/7. C. H. Hockly, to Armoured Car Wing, 'Iraq, instead of to No. 6 Sqdn., 'Iraq, as previously notified, 19/4. H. J. J. Jagger and P. MacG. Watt, to No. 1 F.T.S., Netheravon, 7/8. F. W. Moxham and H. E. Power, to No. 2 F.T.S., Digby, 7/8. A. P. Bett, to No. 3 F.T.S., Grantham, 7/8. J. Norwood, to No. 5 F.T.S., Sealand, 7/8. E. S. Finch and J. W. Gillan, to R.A.F. College, Cranwell, 7/8. B. E. Moody, to No. 501 Sqdn., Filton, 7/8. P. J. Hayes, M.B.E., A.F.C., to M.A.E.E., Felixstowe, 24/7. C. A. Pearson, to Night Flying Flight, Biggin Hill, 23/7. J. H. Powle, to H.A.D., Henlow, 13/7.

Pilot Officers J. G. W. Weston, to No. 207 Sqdn., Eastchurch, 30/7. E. J. Laine, H. M. Pearson and K. R. Coates, to No. 201 Sqdn., Calshot, 31/7. J. D. Rutherford, to No. 204 Sqdn., Cattewater, 31/7. B. T. Shelley and F. C. Sturgis, to M.A.E.E., Felixstowe, 31/7.

MEDICAL BRANCH.—Flight Lieutenant P. D. Barling M.B., to R.A.F. Hospital, Cranwell, 4/8.

ACCOUNTANT BRANCH.—Flight Lieutenant W. E. Fisher, M.C., to R.A.F. Record Office, Ruislip, 3/8.

Flying Officers T. C. Reep, to No. 3 Stores Depot, Milton, 26/8. M. L. Jones, to School of Balloon Training, Larkhill, 29/7.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident at Sutton Bridge, Lincolnshire, to a Gamecock machine of No. 23 (Fighter) Squadron, Kenley, on August 14, Flg. Off. Charles Henry Jones, the pilot and sole occupant of the aircraft, was killed.

At the Inquest at Sutton Bridge on Aug. 14, Sjt. James Hickling, of No. 111 (F.) Sqdn., said that the machine took off normally, but seemed to turn too steeply and hit the ground with the engine full on. The machine, which had 200 rounds of ammunition on board, caught fire on impact.

Air Communications.

With reference to the Editorial comment on the announcement that His Royal Highness the Prince of Wales had crossed the Channel as a passenger in a low-powered single-engined aeroplane without floats or flotation gear, THE AEROPLANE understands that on the outward journey the Prince's machine was escorted by a flying-boat, and that the crossing on the return journey was made at 9,000 ft.

Nevertheless one holds that a low-powered aeroplane is not a proper vehicle for the Heir to the Throne when crossing the Channel. There is much to be said in favour of small machines when landing in unknown aerodromes, but the danger of putting a small aeroplane down in a sea-way outweighs the danger of damaging a big machine by overrunning the limits of a small aerodrome. Whatever escort may be provided, a small aeroplane is always liable to break up and sink before its escort can reach it.—C. G. G.

Courts-martial.

A Court-martial took place on Aug. 15 at Chatham in connection with the explosion in H.M.S. *Vindictive* on July 23. Lieut. Simon Barrett, R.N., was sentenced to be dismissed his ship and severely reprimanded.

At a second Court-martial Flt. Lt. G. R. O'Sullivan, R.A.F. (No. 444 (F.S.R.) Flight, R.A.F., H.M.S. *Vindictive*) was tried on two charges connected with the previous Court-martial and was acquitted.

THE SHORT GURNARD.—A two-seat Fleet Fighter Reconnaissance biplane with the Bristol Jupiter engine and Townend ring-cowling.

The following announcement appeared in *The London Gazette* of August 13:—

Flt. Lt. C. G. Hancock is dismissed the Service by sentence of General Court-martial (Aug. 1).

Flt. Lt. Hancock was concerned in the unauthorised flight from Eastchurch to Hendon by Flg. Off. D. S. Thomas, of Henlow.

Permanent Commissions in the Stores Branch.

The Air Council have provisionally selected the following officers of the Stores Branch, who hold short service commissions, for permanent commissions. No further selection will be made:—

Flying Officers.—E. G. M. Charleston, H. M. S. Dawes, G. H. Doveton, F. W. Felgate, P. G. Mote, P. P. S. Rickard, L. Taylor.

The Schneider Trophy Contest, 1929.

From 00.01 hours on Sept. 6, 1929, until the completion of the Schneider Trophy Contest on Sept. 7 (or later, in the event of postponement), no aircraft other than competing aircraft are to enter the area designated hereunder:—

The area enclosed by straight lines drawn from Yarmouth Pier to Lymington Pier and thence to Netley Castle; by the line of high water between Netley Castle and Hamble Spit; by straight lines drawn from Hamble Spit to Cosham Railway Station, thence to Selsey Bill Coast Guard Station, thence to Bembridge Railway Station, and thence to Gurnard Village; and by the line of high water from Gurnard Village to Yarmouth Pier.

Modern Foreign Languages.

A course in Russian will begin at King's College, London, in October 1929.

One officer of the R.A.F. will be selected to attend. The officer selected will be regarded as being on duty and will receive full pay and allowances during the course. Officers desiring to attend should submit applications through the usual channels.

Air and other officers commanding, in forwarding applications should state whether they are recommended and give particulars of any special qualifications possessed by the applicants, such as aptitude for languages, staff duties, etc.

Applications from home commands should reach the Air Ministry by Sept. 1, 1929. Officers abroad may send in their names for consideration for future courses.

Officers applying should hold permanent commissions in the general duties branch and be not over 30 years of age on Oct. 1, 1929.

A Service Contemporary.

The Planesman, a monthly journal for the Royal Air Force, gives all the latest news from R.A.F. Stations at home and abroad. It also gives comprehensive accounts of sports and athletics and has illustrated articles of topical and general interest. It only costs 6d. a month, and those officers and airmen of the R.A.F. who cannot buy it in their Unit should apply to the Editor, *The Planesman*, R.A.F., Eastchurch, Kent.

THE NEW CHIEF OF THE AIR STAFF.

His Majesty the King has been pleased to approve the appointment of Air Chief Marshal Sir John M. Salmond, K.C.B., C.M.G., C.V.O., D.S.O., A.D.C., to succeed Marshal of the Royal Air Force Sir Hugh Trenchard, Bart., G.C.B., D.S.O., as Chief of the Air Staff with effect from Jan. 1, 1930.

Air Chief Marshal Sir John Salmond was born in 1881 and educated at Wellington and Sandhurst. He entered The King's Own Royal Regiment (Lancaster) in 1901 and served in the South African War in 1901-2. He was promoted Captain in 1910.

He learned to fly on a Grahame-White biplane at Hendon and his Royal Aero Club certificate, No. 272, is dated Aug. 13, 1912. He joined the Royal Flying Corps in 1912 and was appointed an Instructor at the Central Flying School in the same year. In 1914 he was appointed to command No. 7 Squadron at Farnborough. In 1914 he was given Brevet rank of Major.

On Aug. 13, 1914, he went to France in command of No. 3 Squadron, R.F.C., which command he held until April, 1915. In June, 1917, having in due course commanded a Wing and a Brigade, he was promoted to the temporary rank of Major-General while commanding the Training Division, R.F.C., in England. In October, 1917, he was appointed to the Army Council as Director-General of Military Aeronautics.

In February, 1918, he took over the command of the R.F.C. in the Field,—Sir Hugh Trenchard having come home to be the first Chief of the the Air Staff in the newly-formed Royal Air Force. He was promoted to the substantive rank of Major-General in April, 1918, and commanded the R.A.F. in France till the end of hostilities.

He was appointed a Companion of the Distinguished Service Order in February, 1915, a Companion of the Order of St. Michael and St. George in June, 1917, a Commander of the Victorian Order in August, 1918, and a Knight Commander of the Bath in January, 1919.

His foreign decorations include the Legion of Honour, the Croix de Guerre (France), the Croix de Guerre (Belgium), the Order of Leopold (Belgium), the Order of the White Eagle (Russia), the Order of the Crown of Italy, and the American Distinguished Service Medal.

He was promoted to the rank of Air Vice-Marshal in August, 1919, and appointed Air Officer Commanding the Inland Area, R.A.F. in 1920. In 1922 he was appointed to command the British Forces in 'Iraq, and was promoted to the rank of Air Marshal in June, 1923.

In January, 1925, he was appointed Air Officer Commanding-in-Chief, Air Defence of Great Britain, on the formation of that Command. He was appointed Air A.D.C. to the King in February, 1925.

During 1928 the services of Sir John Salmond were loaned to the Commonwealth of Australia to advise them on the air defence of the Commonwealth and on the organisation, training, and equipment of the Royal Australian Air Force.

On Jan. 1, 1929, Sir John Salmond was promoted to the rank of Air Chief Marshal and appointed Air Member for Personnel, the Air Council.

The appointment of Sir John Salmond will give general satisfaction in the Royal Air Force, and it will be a great relief to those who for several years have been arguing about who was likely to succeed Sir Hugh Trenchard.

The Chief of the Air Staff need not necessarily be the senior officer of the Royal Air Force. Essentially the Chief of the Air Staff is rather the Chairman of a Committee than a Commander-in-Chief, just as is the Chief of the Imperial General Staff at the War Office.

In time of war the probability is that the senior officer of the Royal Air Force would be the Air Officer Commanding in the field, and in a future war he may very conceivably be the Generalissimo of all forces of the air, land and sea. In such case the Chief of the Air Staff at home might quite conceivably be considerably junior to the Commander in Chief and to other senior officers in the field. But, in time of peace, the senior officer of the Air Force may well be Chief of the Air Staff in that his rank necessarily gives him authority over those holding the various commands which come under the Air Staff.

Leaving out any question of seniority, the appointment of Sir John Salmond will be highly appreciated by almost everybody in the Air Force. Only a man who holds the respect and trust of all ranks could hope to follow Sir Hugh Trenchard successfully, and Sir John Salmond is trusted and respected.

Before the War he was one of the finest pilots in the Air Force, and though in these days he is too busy to fly much, he is still as good a pilot as needs be. Also, before the War, when he was at the C.F.S., and when he commanded a squadron in the R.F.C., his officers and men knew him for a just and sympathetic Commanding Officer, severe when severity was needed but ready to overlook small faults in men who were doing their best and were useful to the Service.

Sir John Salmond.

From the moment when War was declared he showed himself to be a born leader of men. Those who have read the late Major McCudden's remarkable book, *Five Years in the R.F.C.*, will understand why the men as well as the officers were ready to follow Major John Salmond anywhere. With each successive step in his rapid promotion from infantry Captain to Major-General within four years Sir John Salmond won the same respect and trust from the growing number of men under his command.

Just a week before the Armistice, in November, 1918, one had the privilege of paying a visit to R.A.F. Advanced Headquarters, in the middle of the devastated area, where Sir John Salmond was established. From there one visited units of all kinds in the R.A.F., and everywhere one found the same enthusiasm for the General Officer Commanding the R.A.F. and the same implicit trust in his judgment, whether of strategy or tactics. And during that visit one had a peculiar opportunity of proving his innate kindliness and consideration.

After the War, as Air Officer Commanding Inland Area, Sir John had the difficult task of organising one of the most chaotic Services that ever existed, composed of a warring mixture of personnel from the Navy, the Army and the Street. But in three or four years everything was running smoothly and he had still further increased the respect with which he was regarded by all ranks.

When in 1922 he went out to command all British Forces in 'Iraq he took on a job which had never been attempted before. That was what Sir Samuel Hoare called "Control Without Occupation," of a mainly hostile country. Before he left Sir John had the whole country thoroughly under control, he had reduced the garrison on the ground by tens of thousands, he had actually reduced the Air Force garrison by several units, and he had reduced the cost of administering 'Iraq by tens of millions of pounds per annum. For this alone he deserves the heart-felt thanks of John Citizen.

Digitized by Google

On his return from 'Iraq in 1925 he undertook the equally important and no less difficult task of organising the Air Defences of Great Britain, and in three years he had at any rate laid the foundations of a system of defence which can be expanded in case of war to become a thoroughly effective defence force. The fact that in the course of air exercises our own attacking squadrons have theoretically laid London waste is merely an indication that, as attack is the best form of defence, our defences are thereby the stronger.

Another side of Sir John's character was disclosed when in 1928 he was lent to the Government of Australia to advise them on the defence of the Commonwealth. His report on Australia's defencelessness has never been published in full. But from those who know something about it one gathers that it is an excellent example of ruthlessness. At any rate something like an upheaval in Australia followed its delivery to the Government. And, as the Australian is always a man of deeds as well as words, Sir John won the whole-hearted respect of everybody in Australia by flying round that Continent, much of the way over trackless deserts and uninhabited coast-line. Even the most captious of his critics was forced to admit that when he talked about defending the Australian coasts he knew what he was talking about.

Since his return and his appointment at the beginning of this year to be Air Member for Personnel in the Air Council Sir John has no doubt been preparing himself to take over the duties of Chief of the Air Staff, and when he assumes those duties the Royal Air Force will have complete confidence in so much of the future as lies under his control.

As Air Chief Marshal Sir John Salmond ranks with but after a full General in the Army. To have reached such rank, even with the advantages of a war to accelerate promotion, at the age of 48, shows exceptional ability. Judging by the careers of the World's great leaders of men Sir John Salmond has anything between twenty and twenty-five years of useful service before him. And all who have followed the history of Service Aviation in the British Empire, and have appreciated the great part that Sir John Salmond has played in making that history, will wish him well.—C. G. G.

THE JAPANESE IMPERIAL AERONAUTIC SOCIETY.

The new building of the Imperial Aeronautic Society of Japan was formally opened at Sakurada Hongo-cho, Tokyo, on June 15. The ceremony began with a greeting by Baron Sakatani, President of the Imperial Aeronautic Society, who said that the building had been built to house the organisation and to concentrate all kinds of enterprises in connection with aviation in one place.

The main floor and balcony are devoted to the exhibition of model aeroplanes given to the Society by foreign and Japanese aeroplane manufacturers. More than 30 models and several full-size engines are exhibited. This exhibition is open to the public without charge.

AERONAUTICS IN JAPAN.—The new building of the Imperial Aeronautic Society of Japan in Tokyo, which was officially opened on June 15.

AERONAUTICS IN JAPAN.—The Theatre (above) and the Museum (below) of the Imperial Aeronautic Society of Japan.

The whole of the second floor is occupied by the Japan Transportation Co.

Part of the third floor is to be devoted to a library on aviation and a newspaper men's club and part of it will be rented.

The offices of the Imperial Aeronautic Society have been established on the fourth floor with a conference room and a special guest room.

The fifth floor consists of an auditorium with a balcony. It has a seating capacity of 1,000.

A correspondent of THE AEROPLANE in Tokyo writes that he has been particularly asked by the President, Baron Sakatani and the Committee to do his best to obtain British models, pamphlets, and books dealing with air routes, etc. He was surprised to find that with the exception of one Vickers Vimy model there was not another British thing on view although nearly every other country was well represented. Manufacturers of British aeroplanes, parts and instruments would do well to send the museum model specimens and particulars of their products, also literature dealing with them.

They may be sent to Mr. A. R. Paget, 476, Sanno-cho, Oiso, Kanagawa-ken, Japana, who has offered to be the medium between British manufacturers and air line companies and the Imperial Aeronautic Society of Japan.

AIR PHOTOGRAPHY.

A recent issue from the Air Ministry is Air Publication 1354, "Air Photography—Part I. Organisation and Training." This may be had from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, E.C.4, at 1s. 3d. net.

The book contains chapters under the headings "Purpose and Value of Air Photography," "General Organisation," "Organisation of Photography in Units," "Flying for Photographic Mosaics and Air Survey," "Air Photography in Co-operation with the Army," "Air Photography in Co-operation with the Royal Navy," "Interpretation of Air Photographs," "Training Photographic Personnel," and appendices containing a specimen report syllabus of training, allocation of duties, and a comprehensive index of various Air Ministry Orders, Air Publications, and the like relating to Photography.

A number of diagrams and sketches illustrating various technical points and explaining how to diagnose various ground markings from the air are included. There is also a large illustration showing the method of preparing a mosaic with a 60 per cent. longitudinal and 30 per cent. lateral overlap This picture makes the method of construction remarkably easy to understand.

OUR SCHNEIDER TROPHY DEFENDERS—II.

A THOROUGHBRED.—A side view of the Gloster-Napier VI at Calshot.—(*"Aeroplane" photograph.*)

The second of the two types of racing seaplanes which have been produced to defend Great Britain in the Schneider Trophy Contest is the Gloster-Napier VI, and the first of the two of this type which have been built has arrived at Calshot Air Station.

The circumstances attending its first public view were not of the same order as those arranged for the Supermarine-Rolls-Royce S-6.

As mentioned last week the Gloster-Napier VI was not quite ready (in that it lacked its final coat of paint) to be present at Calshot on Aug. 12. The first machine had, however, been assembled at the works at Cheltenham and the engine had been run, but the company rightly decided that unnecessary time would have been wasted if the machine was transported to Calshot before it was completely ready to be finally assembled and flown on test.

The result was that the Gloster VI missed the initial publicity gained by its friendly rival. Its arrival later in the week, however, was not by any means unheralded or unsung.

The fact that it came by road and reached Calshot after dark provided just the right material for the "experts" who are now camping in the *environs* of the Air Station. To arrive "under cover of darkness" or "by stealth of night" added piquancy to the illusion of mystery, an illusion that all conscientious journalists delight in magnifying to the *n*th degree.

Be that as it may, the Gloster-Napier VI arrived at Calshot on Friday night, was hurriedly assembled on Saturday, and on Sunday "the huge doors of the hangar were rolled back and the waiting crowd of air experts gasped in admiration and amazement." After the gasping had ceased and after innumerable photographs had been taken the machine, variously described as "a winged meteor of gleaming gold," "the golden arrow of the air," "Venus of the air," etc., was wheeled back into the hangar, the doors were clanged shut and the work of assembly for serious flying was begun. In spite of the lyrical indigestion of the daily journalists one still prefers the name "Bullet with a bow tie," which was bestowed on a machine of similar design by its pilot when asked what it was like.

The Gloster-Napier VI is a novelty for the Gloster Aircraft Co. in that it is a monoplane. The missing number between the Gloster IV biplane, built for the 1927 contest, and the Gloster VI was the project for a biplane defender for this year's contest.

Mr. H. P. Folland, the company's chief designer, is a staunch supporter of biplane construction, but in the unbuilt Gloster V he found that the upper plane would come so far forward as to be partly over the central block of four cylinders of the Napier Lion engine and in the interests of accessibility this project was abandoned.

Previous Schneider Trophy aircraft have always given the impression that the cross-sectional area of the fuselage had reached the irreducible minimum, this minimum being largely governed by the alleged inelasticity of the existing power plant and the present pattern in pilots. In the Gloster VI the fuselage has again been reduced in cross sectional area and what seems even more extraordinary the Napier Lion engine, in spite of being induced to give an increased output, has once again successfully submitted itself to the modern craze for slimming.

Briefly, the Gloster VI may be described as the Gloster IV with the upper plane removed.

The fuselage is of the monocoque type and is built of duralumin, including the covering. It seems a perfect streamline, the only excrescences, if they can be called such, being the cowling over the three blocks of cylinders of the Napier Lion engine. The centre block, however, performs a useful function in that when the cowling is carried aft it

FRONTAL AREA.—The clean lines of the Gloster-Napier VI are here shown.—(*"Aeroplane" photograph.*)

AUSTRALIAN NATIONAL AIRWAYS LIMITED

Head Office: Challis House, Sydney, Australia

C. E. Kingsford-Smith and C. T. P. Ulm, Joint Managing Directors

Pilots wanted

[2 vacancies]

We shall be glad to receive applications from fully qualified British pilots, experienced on three-engine types, for permanent service with this Company in Australia.
Successful applicants will be expected to leave for Australia at the end of September or early in October.
Terms: Fixed salary, commencing at £751 p a. with bonus increases which should bring minimum remuneration up to £900 p.a. Address applications to London office.

Agencies

We are desirous of securing Australasian agencies for suitable types of:

(1) *Aircraft*—Landplanes, Seaplanes, Flying Boats
(2) *Aero Engines*—All types
(3) *Aviation Instruments and Accessories.—All Aircraft Materials.*

We will be glad to hear from English manufacturers of these products. Please give fullest information when replying to our London Address:

A BULLET WITH A BOW TIE.—Another view of the Gloster-Napier VI at Calshot—(*"Aeroplane" photograph.*)

forms a streamline for the pilot's head and finally merges into the fin and rudder.

All rivetting is flush with the skin, and leaves an entirely smooth surface. The fuselage is of the smallest possible dimensions and the cockpit is only just big enough for a normal-sized pilot.

The wings are of a symmetrical section and vary in thickness from root to tip. The thickest section is in the region of the attachments of the bracing wires. All wing-bracing fittings are of high-tensile steel and are housed completely within the wings, as is the complete aileron control system.

The wing-structure follows the usual Gloster racing practice. This consists of a number of spruce spars, usually six, built up to form a cellular section. These spars are covered with a plywood skin which has been previously built up on a dummy former. The whole is screwed and glued together with waterproof glue.

Practically the whole of the area of the wing surface, on top of the plywood, is covered with the wing radiators. These radiators consist of a number of thin flat brass tubes laid side-by-side and sweated together. The resultant radiators possess an absolutely smooth surface and add practically no resistance to the wings.

The oil-radiator is built up in a similar manner. The main oil-tank is mounted in the fuselage behind the pilot's cockpit and the section of the fuselage surrounding the oil-tank is made up as a flat tube radiator, which is let in flush with the skin of the fuselage and follows the true contour.

The tail unit is built up in a manner similar to the wings. All surfaces are of the cellular spar construction covered with spruce multiply, the whole being glued and screwed together. The elevator and rudder controls run direct to each controlling surface and are operated by sprocket and chains connected by solid steel tie-rods. The elevator and rudder controls are fitted with a variable control device giving a ratio of 2 : 3 for small movements grading off to a ratio of 3 : 2 for the last movement of the controls.

The floats are of the usual Gloster streamline type. They are built up of duralumin and each consists of a central longitudinal member to which are attached a number of transverse bulkheads spaced at about an average of 18 inches apart.

The bottoms of the floats are reinforced with "Z" stiffeners and the upper surfaces are reinforced with "L" stiffeners. All external rivetting is flush with the surface, thus giving an entirely smooth exterior. The floats are attached to the fuselage by two pairs of streamline struts, crossed-braced with streamline wires. These struts instead of meeting on the centre-line of the underside of the fuselage, as in the Gloster IV, meet the body on either side of the fuselage at points where the wings are attached.

Within each float is accommodated a petrol tank of equal capacity. This represents a departure from previous Gloster practice, but the reduction in size of the fuselage has made this imperative. The petrol system is completed by a 2-gallon service tank located in the fuselage and two engine-driven fuel pumps raise the petrol from the floats to the service tank. Special arrangements ensure an even feed from both tanks.

The engine is a Napier Lion VIID and is a development of the Series VIIB model, which was used in the winning

THE FOREIGNER'S VIEW.—A stern view of the Glos ter-Napier VI; which we hope may be familiar to our esteemed foreign friends and competitors.—(*"Aeroplane" photograph.*)

Digitized by Google

machine in the 1927 contest and in the seaplane which attained the highest speed ever made over a 3 km. course. The engine has still further been reduced in frontal area.

The Series VIID is supercharged. The supercharger is at the back of the engine, where it does not interfere with the overall size.

The air compressor has been designed by the Napier company with the cordial co-operation of the British Thompson Houston Co. Ltd. and the Bristol Aeroplane Co. Ltd.

The finish of the wings, fuselage, tail-unit and float struts of the Gloster Napier VI is old gold, or, more crudely, brass. The paint exactly matches the water and oil radiators in the wings and fuselage. The floats are natural duralumin, plain varnished. Seen in the corner of a dark shed this finish does not appear so attractive as the old Gloster finish of blue and bronze. However, the presence of a brass oil radiator in the fuselage, which could not be painted, ruled out any other colour scheme.

The whole machine gives the impression of true speed, and there is little doubt that this impression will be borne out in practice.

Great Britain has now laid before the World its defenders. Whatever the challenging countries produce this country has every reason to be proud of the products of the Gloster Aircraft Co. Ltd., the Supermarine Aviation Works Ltd., D. Napier and Son Ltd. and Rolls-Royce Ltd. These four companies may rest assured that they have the good wishes of the British Empire behind them.—L. B.

ITALIAN SCHNEIDER PRACTICE.

The Times correspondent in Milan in a message dated Aug. 18, states:—

During a test flight yesterday afternoon over the Lake of Garda, just off Desenzano, the base of the Italian preparations for the Schneider Cup competition, the aeroplane which Sergeant-Major Francesco Agello, a member of the Italian team, was flying plunged into the lake. The pilot had a narrow escape from death.

Yesterday Sergeant-Major Agello entered the cockpit of a new Fiat C. 29 machine, and, after taxi-ing away from the shore, opened the throttle, and attempted to rise. The seaplane refused, however, to rise from the water, and was towed back to the slipway and examined. Half an hour later Sergeant-Major Agello again went out. A first attempt to rise was unsuccessful, but on the second occasion the seaplane left the water after a run of about 300 or 400 yards. When it had risen about 50 feet, and had flown perhaps 100 yards, the machine was seen to dip forward and plunge with terrible force into the lake.

Several motor-boats and a seaplane on patrol duty immediately dashed to the spot where, after disappearing once, the pilot was seen to be floating on the water. Sergeant-Major Agello was put on board one of the motor-boats and taken ashore. After a medical examination it was found that, with the exception of a few scratches, he had escaped injury. Sergeant-Major Agello was aided in his efforts to rise to the surface of the water by the special lifebelt which all the Italian Schneider Cup pilots wear.

So soon as it was found that the pilot was uninjured, General Balbo, the Under-Secretary for Air, ordered the trials to be continued, and further flights were made during the afternoon. Only a few fragments of the fuselage and floats of the machine have been salved; the engine has disappeared in the lake, which at the point of the accident is over 300 ft. deep.

This is the second seaplane of the C. 29 type to be lost on the Lake of Garda. The first, after having made eight flights, was destroyed while alighting on the lake.

ROYAL AERO CLUB PRACTICE.

This is from the Royal Aero Club:—

How, When and Where to See the Air Race on Sept. 7.

Nearly a million people are expected to witness the great international seaplane race for the Schneider Trophy, which takes place off the Isle of Wight on September 7.

France, Italy and America have each entered teams to challenge the British defenders, and speeds of over 330 miles an hour are expected to be reached in the thrilling contest which will be fought out over a quadrilateral course above the Solent between the Isle of Wight and the mainland.

Elaborate arrangements have been made to accommodate the vast crowds of visitors who are arriving by air, land and sea.

Two land aerodromes at Hamble and East Cowes and one seaplane station at Cowes have been reserved for visiting aircraft under the supervision of the Automobile Association; spectators afloat will be berthed, according to the size and draught of their vessels, in the special zones which have been reserved inside the boundaries of the course (details of which have already been issued).

For those visitors arriving by road or rail extensive arrangements have also been made by motor-coach companies, the various motoring organisations and the Southern Railway, who, alone, are running a series of special trains to Southampton and Portsmouth, at 15-minute intervals, throughout Friday evening and Saturday, the day of the Race.

The Royal Aero Club recommends those desirous of witnessing the Contest to make advance arrangements now and, for the guidance of intending spectators, issues preliminary details of the facilities available at the principal vantage points around the course, as follows:—

Portsmouth and Southsea.

Many thousands of people are expected to assemble on the 4½ miles of front. Excellent views of a turning point can be had from the South Parade Pier, which will accommodate 5,000 people, while a further 3,000 seats will be available on the Parade in front of the Castle.

Stands holding many thousands will be erected at intervals along the front and, from the natural grandstand of the foreshore, the Race will be visible practically throughout its course. In addition, the whole of Southsea Common is to be turned into a car park.

[And all the local inhabitants are reckoning on making fortunes out of visitors.—C. G. G.]

Stokes Bay.

This area, ranging from Gosport round Gilkicker Point to Fort Haslar is the only land over which the competing

THE AMERICAN CHALLENGER.—The Mercury monoplane (24-cylinder Packard engine) which Lieut. Alford Williams, U.S.N., is reported to be bringing to England for the Schneider Trophy Contest.

aircraft will pass, and provision has been made for a widespread concentration on this point by spectators. A large car park will be situated on the Common, and the area should be approached via Fareham main road, which will be plainly sign-posted.

[The crowds will be most uncomfortable. And what is a "widespread concentration," anyhow?—C. G. G.]

HAYLING ISLAND.

Official car parks will be provided and the long foreshore permits of the accommodation of many visitors.

[And the turning point is so far away that practically nothing will be seen of the flying.—C. G. G.]

LEE-ON-SOLENT.

Car parks and public enclosures along the sea front.

[And practically nothing will be visible.—C. G. G.]

RYDE (I.O.W.).

The scene of the start and finish of the Race. One portion of the Pier, belonging to the Southern Railway, will be reserved for special, inclusive excursions run from London on the day of the Race, while the other portion, owned by Ryde Council, will be open to the public. In addition, special enclosures will be available along the front with numerous car parks.

[A splendid resort for millionaires, and pigeons who do not mind being plucked.—C. G. G.]

COWES AND EAST COWES (I.O.W.).

Opposite an acute turning point on the course, these towns offer ideal vantage points and will be official car parks. [More crowds and more piracy.—C. G. G.]

ST. HELENS (I.O.W.).

Provision is being made for public enclosures in Puckpool Park.—[*Query*—Misprint for pluck-fool?—C. G. G.]

The Royal Aero Club adds that it is arranging for loud speakers and large score boards to be installed all round the Course, wherever public enclosures are provided, in order to keep visitors acquainted of the progress of the competing aircraft, lap by lap.

Despite the very high speeds likely to be attained on sea, no danger to spectators need be anticipated as ample provision has been made for emergency landing lanes in case of accident to competing seaplanes, which will be able to alight well beyond the limits of the course, the public enclosures and ship berthing areas.

[How does one anticipate an expected danger? Presumably by staying away from the danger areas, thus saving much money and personal inconvenience, and surviving to read all about the tragedies in the privileged Sunday, and other, newspapers afterwards.

Meantime, the finest natural grandstand in the World,—to wit the coast line from Lee-on-Solent to Southampton Water,—is left lying idle because the people who fixed the course were so foolish as to put the turning-points in the wrong places, and too conceited to acknowledge their mistake when it was pointed out to them,—or else too fond of the Isle of Wight to recognise the absurdity of making it the Headquarters of the contest.—C. G. G.]

SEA-GOING PRACTICE.

The Evening News of Aug. 19 states:—

The Orient liner *Orford*, bound from Immingham to Copenhagen with about 550 passengers on board, went ashore at the entrance to Copenhagen Harbour to-day, but refloated at high tide three hours later. She steamed into harbour undamaged.

MOORING FACILITIES.

The Supermarine Aviation Works Ltd. have accommodation for marine aircraft visiting the Schneider Trophy Contest. Three mooring buoys will be available at the company's shops at Hythe, Southampton Water, where re-fuelling can be done. Intending visitors should make early application.

SCHNEIDER ROAD TRAFFIC.

The Times states that at a conference between the Royal Aero Club and the Chief Constable of Hampshire at Winchester on Aug. 17 it was decided that all road traffic into Hampshire on the day of the contest should conform to the following signalling system:—

Cars bound for Portsmouth and Southsea to carry red disks; Gosport and Stokes Bay, yellow; Lee-on-Solent, green; Hayling Island, Cambridge blue. Motorists must provide these disks for themselves, and the county police will automatically direct the traffic on to the appropriate routes and check it past every road junction to the destinations indicated by the disks.

SCHNEIDER PRICES.

A correspondent in the Isle of Wight writes:—

I have been endeavouring to find out what prohibitive prices are being charged.

So far the Islanders are proving very close and canny on the subject, in view of the outcry in the Press on this subject generally, but I have a shrewd idea that in many instances the prices will be almost prohibitive.

One hotel in Ryde is charging £5 5s. (Five Guineas) for a seat on the roof, upon which some sort of stand is being constructed. This is openly advertised. Being a considerable distance along the front, and some way from the start, it seems to my mind, an imposition.

Anent Cowes, I heard on excellent authority recently that during the "Week" a lady visitor was charged 27s. 6d. for a chicken, originally purchased for five shillings! So it augurs well for anyone staying at Cowes.

MR. MUDDLE GETS TO WORK.

Some weeks ago THE AEROPLANE had the pleasure of introducing to the aeronautical community Mr. Muddle and Mr. Meddle, the two real powers behind the scenes in the running of the Schneider Trophy Contest. Mr. Muddle, readers may remember, is the representative of the Royal Aero Club, Mr. Meddle has been at times the moving spirit at the Air Ministry. Since they were introduced to our readers these two gentlemen have been, in the words of Mr. Pyecroft, "lyin' powerful doggo." Or else perchance they have relied on the natural inertia of the Englishman and the habitual delays of committees and Air Ministry contractors, to get in their fine work for them. Consequently nothing whatever has been heard of them for weeks and weeks and weeks.

Now at last Mr. Muddle is showing signs of activity. Here is the latest statement issued to the Press under his influence:—

In view of the limited accommodation available on Ryde Pier it has been found necessary to decide to issue Press badges on a strictly defined basis. The broad principle adopted is that the claims of national News Agencies, the leading daily and Sunday newspapers of the competing countries should be given priority and that the needs of other newspapers and technical journals will then be provided for in so far as space permits.

Behold! Brethren of the Technical Press of Europe Asia and the Americas. We, who have made aviation what it is, we who have slaved for twenty years to educate national news agencies and leading daily and Sunday newspapers of the competing countries, not to mention our own Aero Clubs, are to be given accommodation on Ryde Pier "in so far as space permits."

That is to say, if M. Bouché of *L'Aéronautique*, or Mr Warner of *Aviation*, or the Editors of *Flugwacht*, *Flugsport* or *Flugwoche*, or *L'Ala d'Italia* or *Aviazione*, or *Vliegfeld* wish to place themselves on Ryde Pier so as to be in touch with the official announcements of the progress of the contest, or if they wish their photographers to take pictures which accurately represent the racing machines flying past the good ship *Orford* off the end of the Pier, they must, if Mr. Muddle, or his representative on duty at the moment, thinks fit, give place to some Fleet Street hack who represents *Sunday Society*, or the *Daily Dope*, or the *Weekly Wail*.

That, my brethren, is the thanks which we get for upholding the Aero Clubs of our respective nations and for trying to guide them, as well as the ignorant and stupid journalists of our respective nations, in the proper handling of aeronautical affairs.

There is another little matter in which Mr. Muddle seems to be taking a hand. Quite a large number of people have been lured into paying exorbitant prices for accommodation in the s.s. *Orford* the night before and the night after the Contest, and during the day of the Contest itself. The idea originally was that the élite or, as some people might prefer to call them, the snobocracy of British Aviation, were to be concentrated in the s.s. *Orford*.

Then Mr. Muddle, apparently not satisfied with the profit to be got out of charging people 34 guineas for two nights' accommodation in a two-berth cabin, seems to have struck the brilliant idea that some more money could be made by organising a day trip to the *Orford*.

Consequently people who have not reserved cabins on board can now leave London in the morning, promenade on the *Orford* all day and be taken off at 10 o'clock at night. And all for two or three guineas a head. Why pay 34 guineas a head for seeing no more, and having all the discomfort of sleeping in a bunk instead of in your own bed?

But that is not all. Mr. Muddle has now sent out a notice that when the snobocracy of aviation, who have already paid deposits on the exorbitant prices for accommodation in the *Orford*, are preparing to attend the Official Banquet to the competing teams on the night of Sept. 7 (whether the Contest has taken place that day or not), the said snobocracy are not to dress for dinner,—because if they did the day trippers might feel out of place.

The Secretary of the Royal Aero Club emphasises the fact that people who have booked cabins in the *Orford* are specially requested not to dress for dinner,—though evening dress is as done in all the best liners.

When one reads all the beautiful advertisements which are now being published by our old friend Mr. Cook, the Tourist's Friend, and by the Southern Railway Company and all sorts of people, offering accommodation in quite good ships, or alternatively day trips to Ryde with seats on Ryde Pier, at a fraction of the price charged by the Royal Aero Club for accommodation in the *Orford*, one begins to wonder whether Mr. Muddle's real name ought not to be Mr. Moses.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

THE AERO CLUB OF SOUTH AFRICA.

The third annual meeting of the Aero Club of South Africa (the Union of all the Flying Clubs in South Africa) was held at Bloemfontein on June 29 and 30. The meeting was highly successful and eighteen delegates from all over the Union were present. Bloemfontein has a wonderful aerodrome, a sympathetic Town Council, and, being the central city of the Union, it has wonderful possibilities for air development.

In the course of his Report the Chairman stated that the Club's last chairman, Col. W. D. Beatty, A.F.C., one of the promoters of the Aero Club of South Africa, had laid a valuable foundation and deserved most of the credit for the progress which they were now able to report. Last year five Clubs out of the six had started flying and this year seven Clubs out of nine were flying. The three new clubs were Witbank, Benoni and Germiston.

The Clubs had flown a total of over 4,500 flying hours. Fourteen light aeroplanes were now owned by the Clubs and 10,000 passengers had been carried in these machines. The number of members now flying solo was 91.

Last year, said the Chairman, the Club had recorded long flights of importance, including those of the Hon. Lady Bailey, Lady Heath, Sir Alan Cobham and Lieut. Bentley. During the period under review a number of flights had helped tremendously to further the cause of aviation in South Africa including those of the Hon. Lady Bailey (return flight), Capt. Halse, Lieut. Pat Murdoch, Mr. Van Lear Black and party, Sq. Ldr. Slatter, Lieut. Bentley's honeymoon flight to England and back, the two French officers and the four Portuguese officers. The Club offered them all very hearty congratulations.

Further progress could also be recorded in the establishment of landing grounds. Nearly every town of importance now had its landing grounds and others were preparing grounds. In nearly all cases Town Councils were leading the way and many were prepared to lay down hangar accommodation and erect workshops.

Imperial Airways in conjunction with the Blackburn-Cobham Aviation firm had completed negotiations for an air service from the Union to Egypt. The Union Government had decided to assist with a subsidy for this line.

The annual output of gold in the Union was approximately 400 tons (about 40 million pounds sterling). Interest on this for a fortnight was tremendous and could be saved by exporting gold by air instead of by sea. Similar conditions could be applied to other precious stones and metals.

The Minister of Posts and Telegraphs, whose Department controlled Civil Aviation in South Africa, had recently stated that the population of the Union was unconcerned about aviation. In reply the Club would remind him that it had over 1,400 members. If the number of passengers carried by the small aircraft companies was added to the 10,000 carried by the Club the total would probably be nearly 20,000, of whom perhaps 15,000 might be said to be permanently converted "air-minded" citizens.

In conclusion the Chairman asked the delegates to go back to their centres determined to preach the good of their cause. Hundreds of people would like to join the movement but they might be shy at first. If they were treated with hospitality and kindness and given willing help to make a start, they would join and bring others. He asked them to draw into their confidence representatives from existing organisations such as Town Councils, Chambers of Commerce, Rotarians and Publicity Associations. In such bodies they would find men with wide experience in administration, organisation, finance and law.

Finally he wished to congratulate the Press for the very able manner in which they had handled aviation matters. It was their business to be farseeing in all matters and as far as aviation was concerned they had not deviated from their policy.

THE MONTREAL LIGHT AEROPLANE CLUB.

Owing to the bad weather and wet condition of the Airport at St. Hubert serious flying did not start until the middle of May. Since then the weather has been good and the aerodrome excellent. After a few minor mishaps early in May the Club has been free from accidents and four machines have been always in commission. During May and up till June 28 the flying hours reached 256. The amount of solo flying has been disappointing. There are over 40 *ab initio* soloists and over 20 old pilots flying solo and the small amount of time flown indicates that many of them have lost interest.

During the period under review five members have passed their tests for private licences, including one woman, Miss Patterson, who did her first solo after 7 hours 20 minutes dual.

The Club sent three machines to the Ottawa Flying Club Meeting on June 3 and won one first, two seconds and a third prize. The following day two of the machines went on to the Kingston Meeting, where they won the Cup presented to the Club sending the greatest number of machines. The Club was also represented at Hamilton on June 5.

A Rumble Club has been formed to improve the standard

AMERICA'S FIRST FLYING CLUB.—Here are seen some of the company at the opening of the first Aviation Country Club in the United States, at Hicksville, Long Island. The Club has been backed by a number of sportsmen pilots, and the Club House is said to have cost £6,000 to build. This Club is the first of many of its kind which are being organised for the promotion of sporting, as differentiated from commercial, aeronautics by the better-class people in aviation in the United States.

of pilotage at the Club. All soloists with five or more hours solo automatically become members and are fined for various offences, such as using the engine to get into the aerodrome, bouncing to the extent of having to use the engine to assist the second landing and so on. The Club held a landing competition on June 23, but the standard was not very high owing to a strong wind.

Arrangements for the erection of a Club house and hangar on the new aerodrome are nearly completed and the Club will move to the new aerodrome in September.

Cross-country flights to various places will be undertaken in future every week by at least two machines so that members will have a chance to learn cross-country flying.

THE AERO CLUB OF BRITISH COLUMBIA.

By the middle of July the Aero Club of British Columbia had done 350 hours of flying time. During this time the two Club aeroplanes G—CAKH and G—CAKW have made 814 flights or operations of all kinds, involving a grand total of 2,613 landings. None of the landings has been bad enough to render the aircraft unserviceable.

Of the fifty active flying members of the Club, forty have at one time or another been under the instruction of Mr. P. A. Hainstock, and five of these have taken their pilot's certificates. Under a recent classification of members under instruction, 15% are well above the average, 30% are above average, 50% are average and 15% are below average.

Two members of the Club, Messrs. D. J. Lawson and J. C. Ballard flew to Chilliwack on July 7 returning via Blaine, as part of their qualifying tests for commercial licences.

In reply to an enquiry, the Club has given the following information:—The maximum number of hours put in by any of the Club aircraft in any one day is 7 hours 15 minutes.

A request for figures for a Vancouver height record has been met by Mr. Leonard Foggin, who claims the figure of 15,500 ft. above sea-level. This is an unofficial figure.

THE SINGAPORE FLYING CLUB.

The flying time of the Singapore Flying Club for the first six months of this year amounted to 278 hours and 45 minutes. This makes a total of 545 hours and 17 minutes since the formation of the Club,—which is very good, considering the limitations under which the Club works.

THE LEICESTERSHIRE AERO CLUB.

The Leicestershire Aero Club have just received the license for their aerodrome at Desford, seven miles E.S.E. of Leicester. At present the use of the ground is limited to light aeroplanes and Avro training machines.

A club house has been built which is 36 ft. by 12 ft. It is divided into two rooms, and has a covered verandah 5 ft. wide along the front.

At present there is only one shed, 30 ft. by 12 ft., whic accommodates the Club Gipsy-Moth with wings folde Two full-size sheds are to be put up shortly.

There is a 1,000 gallon petrol tank with a five gallo pump on the ground, and arrangements are being mad to keep supplies of the various brands of oil in addition the Club's own bulk storage of Castrol XXL.

Mr. R. C. Winn, the Chairman of Committee, has mad several landings on the new aerodrome and has found th surface excellent.

The Leicester Club proposes to hold an opening meetin on Sept. 28. All communications should be made to th Hon. Secretary, Mr. H. Purt, Leicester Chamber of Com merce, 3, Granby Street, Leicester.

TO DEVON BY THE SEA.

Mr. W. R. Parkhouse, of the Agra Engineering Co. Lt who runs the Haldon Aerodrome and School of Flyi at Teignmouth, South Devon, states that an Air Rally a Demonstration of light aeroplanes will be held at Hald on Sept. 21 and 22. A dinner and dance is being arrang for the evening, and for the Sunday morning he hopes arrange a golf match between a team of visitors and local club whose course adjoins the aerodrome.

The Haldon people do not propose to organise anythi so ambitious as has been done by more important clu and air-parks, but they assure visitors a pleasant we end in what is in fact one of the most beautiful parts England.

The Haldon Aerodrome is doing surprisingly well co sidering that it has the sea on one side of it and is limi in its scope in all other directions by the narrowness England in that particular area. The aerodrome was o started a year ago, by the Agra Engineering Co. Ltd., it now houses six machines permanently. One belongs the firm, and the others have been sold to private own

Two of the private owners are the Honourable Rich Westenra (brother of the Honourable Lady Bailey) and wife. This is one of the few instances, in this coun at any rate, of there being two machines in one fami

Pupils continue to join the School and are turning quite satisfactorily. Also a gratifying number of priv owners have visited the aerodrome, and find that part Devonshire a very pleasing week-end resort.

OUT ON THE PRAIRIES.

A correspondent in Winnipeg writes:—

We have had a little fun here in various ways. organised a flying picnic the other day and six of us t off in two Moths and an Avian to visit a farmer about miles out. The silly beggar had ploughed his stubble f the wrong way of the wind, and although we didn't land

SOCIETY FLYING IN THE STATES.—Baptising the first aeroplane of the new Aviation Country Club at Hicksville, Long Island, which is being run by quite the best people in New York Society. The personalities in the picture, reading from left to right, are:—Mr. Edward O. McDonnell, Vice-President of the Aviation Country Club; the Military Attaché to the Japanese Embassy in Washington; Mr. F. Trubee Davison, Assistant Secretary of War for Aviation; Miss Ann McDonnell; Miss Emily Lawrence; Miss Frances Reaves; Miss Eleanor Hoyt; Mr. Charles L. Lawrance, famous as the pioneer of the radial engine movement in the States; and Mr. John S. Reaves. There is interest in noting that the Club's first aeroplane is a slotted Gipsy-Moth.

A chain of flying clubs . .

THE rules of membership of the N.F.S. provide that a member of one club automatically becomes an honorary member of all other clubs within the N.F.S. orbit. So that, for one subscription, a member, flying or non-flying, may take the fullest advantage of the amenities and facilities provided at each and every club.

When completed, the N.F.S. organisation will form a chain of 71 flying clubs and landing stations, with the London Air Park at Hanworth as the centre. The facilities at each air park will embrace a comfortable club-house, hangars, and technical staff; besides lock-up facilities for members who fly their own machines.

HANWORTH—OPEN IN SEPTEMBER.

A limited number of members are now being admitted to the Hanworth Club at the following special rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-flying **Members, 3 gns. in each case. For this year up to 31st December, two-thirds of the annual subscription is rebated.**

Write to-day for the N.F.S. brochure describing the privileges of membership and the services offered to all who wish to fly.

our noses we couldn't get our passengers off again. Had to ferry the buses solo to a pasture a mile away.

On the way home we met a storm and two machines had to land owing to one girl pilot and one lady passenger. Michael de Blicquy was in charge of the latter and judged best not to chance the moral effects of lightning at close range. Two of us got back to Winnipeg all right and took out a car for them. The planes were brought back next day.

On Sunday a townsman of yours drifted out to the aerodrome and asked the price of an hour's flying. He was told, and he handed over the cash in a sort of limp haste and said he wanted to cool off. It *was* rather warm. However, with the aid of the Gipsy he found it very nice at 10,000 and there were samples of every known cloud formation for study. He saw one comic thunderstorm flashing away a mile-and-a-half below.

He had hardly got down when Mike asked the pilot to go on an emergency errand of mercy. One of our private owners had landed on a narrow beach about 50 miles up the shore of Lake Winnipeg and nosed onto his prop. As a matter of fact there were some other small matters, but not enough to prevent him from flying home.

As always in these cases the directions were vague and the rescuers searched for an hour and a half before finding the Avian. Our air engineer was one of the crew and the machine carried a spare prop for the marooned beachcombers. When the pilot saw the spot he cursed the silly lack of foresight by which a Gipsy prop goes the other way. He had a feeling he might need a spare himself. However, the Gipsy is more tail-heavy on the ground than our Avians, and he came in between forest and lake hoping against hope that there was something fit to land on in the blind spot. the machine bounced a bit, but both flew home again.

FLYING WITHOUT TEARS.

The Cinque Ports Flying Club has produced a very comprehensive guide for prospective members. It is well illustrated with photographs of the Club, the machines, the surrounding country and some of the members.

This handbook starts by giving a list of the Directors of the controlling company, and having thus inspired confidence it becomes patriotic and explains how the reader can help his or her country by learning to fly. This is followed by a chapter on accidents, which explains to what sort of people accidents happen and why, and adds that in 1927 the Flying Clubs had 2,744 members, and flew 6,158 hours in club aircraft without a single fatal accident to a club member flying a club machine.

The handbook lets itself go on the advantages of flying for business and pleasure, and then describes, most vividly, a first lesson in flying. Prospective members are told what to wear in the air and how to behave on the ground. A clear statement is given of what the Club membership and flying tuition will cost them according to their adaptability.

Copies of this interesting document may be had from the Secretary, Cinque Ports Flying Club, Lympne, Kent, for 6d. post free—and very good value it is at the price.

THE AERO SHOW FLYING COMPETITION.

Miss A. M. Macdonald, of Egham, Surrey, and Mr. W. L. Selkirk, of Grays, Essex, have been declared winners of the Second Flying Competition which was held at the Olympia Aero Show. The final selection was made at the Air Ministry by Sir Sefton Brancker, Lady Bailey, Group Captain Flack, and Squadron Leader Reid, who acted as judges on behalf of the Aero Show Committee.

A remarkable feature of the tests at Olympia on the Reid Pilot Indicator was the high standard of aptitude shown by the women competitors. The charts of the six women selected for the final tests were definitely superior to those of the six men. Miss Macdonald, who recorded the best results on the Reid machine, and was awarded the women's prize in the second competition, was the runner-up to Miss Sale Barker in the first competition.

The winners in both competitions, two women and two men, are being taught to fly by National Flying Services Ltd. at their aerodrome at Hanworth.

Miss Sale Barker and Mr. H. Henry, winners of the first competition, have now about ended their instruction.

Mr. Henry, handicapped by the difficulty of sparing time for instruction, got special leave from his employers, and has been doing very well.

These competitions aroused widespread interest and the two Reid machines installed at Olympia were kept working at full pressure to cope with the daily rush of entrants.

MOTH DISTRIBUTION.

The following new Gipsy Moths have been sold by Malcolm Campbell (London), 1927, Ltd., distributors for the Gipsy Moth, since June 22, 1929:—G-AAKX, to Group Capt. J. E. A. Baldwin, D.S.O., Central Flying School, R.A.F.; G-AAIM, to Capt. Shaw, Shell-Mex Ltd.; G-AAJV, to Lt. Cmdr. Glen Kidston; G-AAJR, to the Hampshire Aeroplane Club; G-AAKW, to Mr. Irvin, the Irving Air Chute Co. Ltd.; G-AAKF, to Mr. H. Armstrong, of New Zealand; G-AAKD, to Mr. A. Methley, of Birmingham; G-AAJN, to Mr. Leslie F. Horne, London; G-AAFL, to Mr. T. O. Mill of Bournemouth; and another to Mr. A. H. Downes Shaw of Bristol.

Malcolm Campbell Ltd. have also sold the following second-hand machines which had previously been taken in part exchange for new or second-hand machines during the same period:—

Cirrus Mark II Moth G-EBQE, to Comte A. Costard Beauregarde, France; Cirrus Mark II Moth G-AABH, to Lt. Col. G. L. P. Henderson; Cirrus Mark II Moth G-EBT to the Brooklands School of Flying; Cirrus Mark II Moth G-EBWY, to the London Aeroplane Club; and Cirrus Mark II Moth G-EBRX, to the Brooklands School of Flying; pre-X Mark II Moth G-EBST, to Mr. W. G. Andrews, of Sunbury; and Gipsy Moth G-AADP, to the Household Brigade Flying Club.

THE DESOUTTER MONOPLANE.

Now that the Aero Show is over the Desoutter Aircraft Company Ltd. is going ahead as rapidly as possible with the production of the D.A.C. 3-seater sports coupé monoplane which was exhibited at Olympia.

One or two developments are being incorporated in the new machine and an interesting new wing-section is being tried which is expected to make the cruising speed even better than it is already.

A number of these machines have been ordered by National Flying Services and will be put into use as soon as delivered.

The announcements of the Desoutter Company, which appear every week in the advertisement pages of THE AEROPLANE will describe the various advantages claimed for the cabin monoplane over the open cockpit type. Those who wish to keep themselves thoroughly up to date with the latest developments of saloon aeroplanes should study these advertisements carefully.

AEROPLANE HANGARS

ESAVIAN
Folding & Sliding
DOORS

The Unique Principle

The Esavian Folding and Sliding Doors are hinged to **Sliding Uprights** (patented) These uprights slide with the greatest ease, being fitted with purpose made Ball-Bearing Runners which carry the weight of doors of any height. Esavian Doors over 20 feet high can be fitted with Winding Gear (patented) so that they can be opened by one man.

The Test

Esavian Fittings have been supplied to the Government for Doors to cover over **Ten miles** of openings. These openings vary in height up to 32 feet and in length to 100 feet. Esavian Doors were fitted to the Hangar at Heston Aerodrome, 19 feet in height and 100 feet in length, and are also being supplied to Hanworth Park.

Esavian Doors, 32 ft. high and 70 ft. long, fitted at Henlow Aerodrome.

COMMERCIAL AERONAUTICS.

THE F.B.I. AND THE AIR MAIL.

The Federation of British Industries are pressing for the development of the air mail to Australia and an over-night air mail to European capitals. Both of these objects are of immediate importance and that such an influential body should press the Government towards such sound development is all to the good.

The Australian and New Zealand Section of the London Chamber of Commerce has decided to ask Sir Granville Ryrie, the High Commissioner for Australia, to fix a date on which he will accompany a deputation to the Postmaster-General to urge the latter to secure an extension of the air mail from Karachi to Bombay, Madras and Colombo.

Further work is also being undertaken by the R.A.F. to secure meteorological data in connection with the eventual opening of the line between Singapore, Rangoon and Calcutta.

IRELAND TO ENGLAND WITH MAILS.

With the idea of speeding up delivery of incoming air mails from America and Canada, an experiment will be made on Saturday, August 24.

The Post Office, in co-operation with the Harbour authorities at Galway, are arranging for some mail-bags to be placed ready for despatch from Oranmore Aerodrome at 8 a.m. on Saturday morning. The ship from which these mails will be taken is the North German Lloyd *Karlsruhe*.

The aeroplane to be used for this flight will be a Vickers Vivid (Napier Lion XIa engine), which has been loaned to Irish Airways Ltd. by Sir Robert McLean, Chairman of Vickers (Aviation) Limited. Col. Russell, of Irish Airways Ltd., together with Mr. J. Summers, of Vickers (Aviation) Limited, will be the two pilots.

With favourable weather the machine should reach Croydon about noon on Saturday,—so that they will not be delivered till Monday, by which time they would have come by sea.

Outward mail is to be picked up at Croydon and carried back to Galway and transferred to an outbound ship.

Col. Russell was Chief of the Irish Free State Air Force. He hopes that this enterprise, which has been made possible by the loan of the machine by Vickers (Aviation) Ltd., will help to popularise flying in Ireland.

The Vivid will leave Weybridge on August 21 for Baldonnell, so as to be ready for a prompt start on the Saturday morning, three days later—doubtless to allow for Irish time.

THE CHANNEL ISLANDS AIR SERVICE.

Tour and Travel Association Ltd. who have recently acquired some Supermarine flying-boats and are running a service to Jersey from the air-port of Woolston, Southampton, have recently had some busy weeks. Unfortunately right in the thick of things one of the boats was fouled by an outboard craft which damaged the boat's hull and laid it up for repairs. To relieve the congestion on the service another craft has been duly baptised and set to work.

Information is that the "Bosun" and office boy have agreed that, as there is so much champagne flowing about owing to honeymoon passengers and launching ceremonies and baptisms, they must return their teetotal badges to the Birmingham Medal Company and will not be sailing to the United Dry States of America after all.

The Aviation Manager of the firm wishes to deny the rumour that they are buying the Dornier Do.*x*. This ship is not considered suitable for the present requirements of the Southampton—Jersey service. But, all the same, there is every hope of the Do.*x* visiting Southampton during the Schneider Week.

STAG LANE NOTES.

The Archdukes Antony and Francis of Hapsburg-Tuscany called at Stag Lane during the week to take delivery of another Moth for their school in Spain. Before taking the machine back they are making a tour of British aerodromes.

The London Club having been closed for the annual holiday, the school pupils have had the aerodrome to themselves. The school appears to be very busy just now, and in addition to a number of English pupils there are Indian, Swiss and Czechs undergoing instruction. The London Club re-opened at the beginning of this week.

Those who saw the two Moths at the Aero Show will be interested to learn that they are both now on active service. The one finished in white and yellow, which was mounted on top of the case of trophies, is taking part in the Norwegian Antarctic Whaling Expedition, piloted by Mr. Lief Lier, who recently flew it from Stag Lane to Gothenburg in the good time of eight hours.

The second machine was sold very soon after the Show opened to M. André Jomain of Paris.

Air Taxis finished up a busy week of newspaper work by sending three machines to Ireland for the T.T. race.

Another newspaper to be added to the list of those regularly using aircraft for newsgathering is *The Newcastle Evening World*, which has just placed an order for a Gipsy Moth with a six-hour tank. The same newspaper has just awarded ten free scholarships in flying to its readers. They will be given instruction at the Newcastle Aero Club.

A note from Canada tells a story concerning the Moth which belongs to the Canadian Aviation League. Piloted

AN HISTORIC OCCASION.—The Anglo-French Conference at the Air Ministry on Aug. 7 to discuss commercial aviation, particularly co-operation in the development of air transport in Africa, in the Middle East and Far East, and in South America. From left to right: The Lord Thomson (Secretary of State for Air), M. Laurent Eynac (the French Minister for Air), Mr. F. Montague (Under-Secretary of State for Air), M. Vivant (representing M. Camerman, Director of Aerial Ways and Communications in France), Sir Sefton Brancker (Director of Civil Aviation), Lieut. de Vaisseau Bos (also representing M. Camerman), Air Commodore Newall (Deputy Chief of the Air Staff), Lieut. de Vaisseau Sala (French Air Attaché), and Mr. Burkett (Directorate of Civil Aviation).

AUTOMATIC SLOT CONTROL

"That the slotted wing has been found to be particularly useful in landing in water, is the opinion of the Director of the Provincial Air Service, who contends that a pilot is thus enabled to 'flatten out' ten or more feet above the surface, without resulting damage, in a 'pancake' landing. Among fliers it is generally conceded that unless there is a ripple to serve as a guide, it is practically impossible to judge distance accurately in landing on calm water."

"EVENING TELEGRAM,"
TORONTO.

by Major-General McBrien, it visited a farm in Nova Scotia and landed with a good many bumps. Investigation revealed a cache containing twenty barrels of rum in the middle of the field. It was contraband and was seized by the authorities.

Although this is probably the first instance of an aircraft acting as a sleuth in unearthing a particularly "rum" affair, there is a perfectly true story of a D.H.9a which tipped up on landing in a very remote spot in the desert and the excavation work by the airscrew brought to light some fine specimens of old Roman coins.—C. A. S.

ANOTHER WORD TO THE TRADE.

An Englishman resident in the Argentine and concerned with aircraft writes: "What we are chiefly up against is American competition in the 3-seater 150-200 h.p. class, which are being showered into the country *on consignment*, but although very dear are extremely attractive."

That is exactly the type of aeroplane that does not exist in this country, and it is exactly the type which is wanted in most parts of the World. The other type which we have not got in this country is the 450-500 h.p. 5-seater or 6-seater cabin job, similar to, but an improvement on, the aged Fokker on which the Duchess of Bedford and her crew flew to India and back. The Americans have lots of them.

Also, if the Americans are going to start pushing out machines to foreign countries "on sale and return,"—which is what this correspondent means by "on consignment,"—the British Aircraft Trade will have to wake up very wide if it is going to compete for the business.

CROYDON NOTES.

Leaving Croydon the other day by Moth for Athens, General Brancker attired in a padded kapok life-belt, and in the act of having his helmet fixed on, presented a tableau irresistibly reminiscent of the illustration in "Alice Through The Looking Glass," where Tweedledum (or Dee) is being fixed up with mattrasses and a saucepan helmet by Alice, a part gracefully played by Major Richard on this occasion. Local colour in the shape of the "monstrous crow" was provided by the K.L.M. Fokker F.VIII just about to take off.

Flt. Lt. Wilson of *The Daily Mail* has been provided with an inflatable coracle of indiarubber with a bicycle pump to blow it up with, in case *Geraldine* should prove fickle any time when crossing to Ireland. One pictures Flt. Lt. Wilson as a sort of barnacle-festooned Rip van Winkle arriving in Fleet Street with photographs so out of date as to be of immense historic value, and bringing a strange tale of being obliged to abandon *Geraldine* at sea, months before, and thereafter being baffled by contrary winds, the swirl of the Gulf Stream and the well-known adverse influence of the moon upon indiarubber, as well as being subjected to dastardly attempts to puncture his boat on the part of anti-Northcliffian sword-fish, frustrated by friendly limpets insured under *The Daily Mail* scheme and willing to assist by acting as adhesive patches.

Jolly Rogers, our piratical aeronaut, being athirst the other day en route for Paris, was properly pirated by an Argosy steward, who handed him a small lemonade, which owing to atmospheric pressure, mostly frothed away into his nostrils when he attempted to quaff it. The worst came later however, when Rogers was charged one and sixpence for the beverage. He is said to have invented several highly original explosive epithets on learning the price.

It is understood that a court of inquiry, consisting of Directors of Carrs biscuits, Armstrong Siddeley Motors and Imperial Airways is being held over a biscuit recently thrown into an Argosy engine during a tea flight. Carrs are understood to maintain that the Jaguar enjoyed the biscuit, but the other members of the Inquiry maintain that this engine still has croup in the carburettor and continually coughs crumbs.

On Monday there were as many as ten French aeroplanes at Croydon. They are believed to have come from far and near to congratulate Mr. Bouderie upon the receipt of an entirely well-earned decoration.

It is particularly gratifying to Mr. Bouderie's many friends to see his years of real hard work for Civil Aviation rewarded with the Cross of the Legion of Honour, and it is gratifying to Mr. Bouderie as a war pilot that the award is given for his Military as well as his Civil services to Aviation.

During July, the K.L.M. passenger figures showed 40% American travellers, 25% British, 20% Dutch and 15% miscellaneous nationalities. If these are the figures on the lines most likely to carry the largest number of genuine business passengers to places like Rotterdam, Hamburg, Berlin and the Scandinavian countries, it seems likely that the Paris lines must have an even greater proportion of American tourists on their passenger lists.—SPRY.

CLARITY IN SAFETY GLASS.

One of the principal problems that has to be faced producers of splinterless glass is the difficulty of preventi the material which forms, so to speak, the "meat in t sandwich" from discolouring under conditions of inte sunlight and heat. In some cases the discolouration whi occurs is so pronounced that a mere glance at the saf screen and windows of a car is sufficient to tell the dea how old it is.

Anyone who has driven behind a discoloured scr knows how it is liable to cause errors in judging speed distance. The result of such errors in landing or taking an aeroplane is easy to imagine.

Splintex Safety Glass Ltd. have adopted a met of testing their product which is singularly interesting cause it is so thorough. At frequent intervals the cellu acetate layer is submitted to a lengthy ordeal of ultra-v rays at the new works at Wimbledon. The apparatus is capable in a few hours of reproducing an intensity light equivalent to the full glare of sunlight of three nor English summers. [Is that enough to hurt anyone?—E

It may be mentioned that, up to date, no sampl Splintex has shown any signs of failing in this rigorous It is, however, well known that laboratory conditions s

times fall short of those which occur in nature. The Splintex Company, therefore, made arrangements some time ago for their splinterless glass to be tested in places where the most searching conditions exist, namely, at Singapore and at Death's Valley, California.

Reports from the latter place show that samples have withstood equatorial heat and the rays of the burning sun for nine months, without any sign of discolouration. From Borneo, where the torrid temperature is combined with intense moisture, similar reports have come. The definite statement has been made from this testing ground that Splintex withstands the action of intense sunshine, high temperature and moisture far better than any other glass.

OXYGEN FOR ALTITUDES.

Siebe, Gorman and Co. Ltd., who are best known as Government contractors for, and as builders of, diving apparatus, write correcting the statement which appeared in The Aeroplane's Second Show Report to the effect that they were requested to produce oxygen apparatus for high-flying as the result of their experience with oxygen apparatus during the War 1914.

The firm point out that they did in fact make oxygen apparatus for various purposes, including its use at high altitudes in balloons, as well as in aeroplanes, many years before the War.

They also make such useful things as inflatable rubber boats and pontoons and life jackets, and other things of interest to private owners.

THE FIRST AIR LEGEND.

Probably the earliest legends concerning flying is that of Daedalus and his son Icarus. According to the story they made their escape from captivity with wings fashioned by Daedalus from feathers and wax. The son, more reckless than his father, flew too near to the sun so that his wings melted and he fell into what is now known as the Icarian Sea.

The Vacuum Oil Company Ltd., in producing a mascot-plate for aeroplanes has incorporated the legendary figures, using a pair of huge wings and the sun's rays as a background. The plate, which is reproduced in blue and gold, bears the words "Fly with Daedalus in Safety—Mobiloil for Reliability."

WACO AIRPLANES

THE winning of last season's major air events again demonstrated the characteristic performance responsible for WACO'S leading position in the American Aircraft Industry.

Overseas representation is now being arranged.

INQUIRIES INVITED.

THE ADVANCE AIRCRAFT COMPANY,
TROY, OHIO, U.S.A.
CABLE ADDRESS : : WACO.

NEW COMPANIES.

E. J. Bowman (Birmingham) Ltd.—Private company. Registered July 25. Capital, £2,000 in £1 shares Objects: To acquire the business of a radiator manufacturer now carried on by E. J. Bowman at 56, Pritchett Street, Birmingham, as "Bowman Radiators," and to carry on the business of manufacturers of radiators for motor-cars, aeroplanes and airships, oil coolers for engines, etc. The directors are: E. J. Bowman, 110, Trinity Road, Birchfield, Birmingham. Maud G Bowman, 110, Trinity Road, Birchfield, Birmingham. The said E. J. Bowman shall be permanent so long as he holds 25 shares. Registered office: 56, Pritchett Street, Birmingham.

Blackburn Consolidated.—Blackburn Consolidated Limited was registered as a "private" company on July 27, with a nominal capital of £140,000 in £1 shares. The objects are to acquire and hold shares, stocks, debentures, debenture stocks, bonds and other securities; to manufacture airships, aeroplanes, seaplanes, flying-boats, helicopters, ships, launches, barges, vessels, and air, sea and other craft and conveyances, and to carry on the business of managers of aerodromes, seaplane bases, motor services and shipping property, etc.

The subscribers (each with one share) are: C. H. S. Millis, 18, Austin Friars, E.C.2, solicitor. C. E. Nisbet, 18, Austin Friars, E.C.2, solicitor.

The first directors are: A. P. Holt, chairman; R. Blackburn and E. Hudson, appointed by R. Blackburn; and H. C. Bevan, appointed by Andrew Holt and Co. (all permanent). So long as R. Blackburn holds 25% of the issued share capital, both he and E. Hudson shall be removable by the said R. Blackburn, but not otherwise, and so long as Andrew Holt and Co. hold a like percentage of shares H. C. Bevan shall be removable by the company, but not otherwise. The expression Andrew Holt and Company, means Andrew Holt and Co., of 7, Gracechurch Street, E.C.3, and any person or corporation to whom or which the benefits accruing to Andrew Holt and Co. under a contract dated June 24, 1929, made between R. Blackburn and that company, may be assigned.

Qualification of ordinary directors: 1. Remuneration: As fixed by the company. Solicitors: Slaughter and May, 18, Austin Friars, E.C.2.

The Robinson Aircraft Company Ltd.—Private company. Registered Aug. 12. Capital £100 in £1 shares. Objects: To carry on the business of mechanical and aeronautical engineers, manufacturers of aircraft, flying machines, water planes, motor boats and balloons, and component parts and accessories, etc. The directors are: R. C. Bartlett (governing director), 53a, Holland Park, W.11, solicitor. Capt. P. G. Robinson (managing director), "Seacroft," Salisbury Road Carshalton, Surrey, engineer. Solicitors: R. C. Bartlett and Co., 44, Bedford Row, W.C. Registered office: 44, Bedford Row, W.C.1.

PERSONAL NOTICES.

Births.

NORMAN.—On Tuesday, Aug. 13, at 27, Welbeck Street, to Patricia, wife of Nigel Norman—a son.

NORTH.—On Aug. 11, to Phyllis, wife of John Dudley North, Hill House, Eaton Hall, Norwich—a daughter.

POBJOY.—On Aug. 13, at Streatham Manor, S.W.16, to Elaine, wife of Douglas R. Pobjoy—a daughter.

Forthcoming Marriage.

GRACE—HEWITT.—An engagement is announced between Charles Frederick Hallyburton Grace, Flt. Lt., R.A.F., son of the late Major C. H. Campbell Grace, Indian Army, and Miss Irene Mary Hewitt, elder daughter of Mr. and Mrs. J. Roland Hewitt, of Foxhall, Ipswich.

Marriages.

WARD—ETHERIDGE.—The marriage took place at Littleham Parish Church on Aug. 16 of Flg. Off. Ellacott Lyne Stephens Ward, R.A.F., only son of Lt.-Col. E. L. Ward, I.M.S. (retired), and Mrs. Ward, of Sidcup, Kent, and Miss Sylvia Etheridge, eldest daughter of Lt.-Col. F Etheridge, 7th Rajput Regiment, and Mrs. Etheridge, of Exmouth.

ZEPPELIN—McEWEN.—The marriage took place quietly at Roquebrune, Cap Martin, France, on Aug. 12, of Leo Parcus, Count von Zeppelin, and Amethe McEwen, daughter of the late Donald Smeaton, C.S.I., M.P.

Death

JONES.—On Aug. 14, at Sutton Bridge, Lincolnshire, as the result of a flying accident, Charles Henry Jones, Flg. Off., No. 23 (Fighter) Squadron, R.A.F.

Mr. Jones was born in 1905 at Penicuik, Midlothian, and entered the Royal Air Force with a short service commission in September 1925. He was posted at that time to No. 23 (Fighter) Squadron for a course of flying training, and remained with the Squadron throughout his Service career.

In May of this year Mr. Jones, with Mr. H. A. Purvis, won the Aerobatics Competition for Fighter Pilots of the Air Defence Command, R.A.F., and consequently were selected to give the demonstration of Individual Aerobatics at the R.A.F. Display in July.

AVIATION CONSULTANTS.

We have specialised in the preparation of complete schemes and estimates for the operation of aircraft in all parts of the world. We advise on the type of aircraft and equipment necessary under varying geographical and climatic conditions.

ALAN COBHAM AVIATION LTD.
150, NEW BOND STREET, W.1.
'Phones: Mayfair 2908. 'Grams: Talsundar, London.

Consulting Aeronautical Engineer.—H. M. Yeatman, M.A. (Cantab), A.F.R.Ae.S., A.M.I.Ae.E., New Zealand Building, 429, Strand, W.C.2. Telephone: Gerrard 3672. All kinds of work in connection with the design, construction and operation of aircraft, Airworthiness Certificates, etc. Technical advice to private owners a speciality.

AIRCRAFT INSTRUMENTS.

Coley Ltd., Aircraft Surplus. Aeroplane landing wheels, new Palmer Cord Tyres, and tubes, 700 × 75 m.m. set two wheels and axle complete, 50s. carriage forward; KLG, F9 Plugs, new, in maker's boxes, doz. 9s. 9d.; Ogilvie Airspeeds, pressure heads complete, new 8s. 3d.; Smith's Indicators, 600-2,600 revs., 3 ft. drive, 22s. 6d.; Cross Levels, 1s. 6d.; Dashboard new spot lamps, 2 volts, length of wire, 1s. 9d. Above postage paid. Free list obtainable. Coley Ltd., Ordnance Works, Queen Elizabeth Road, Kingston-on-Thames. 'Phone, 0365.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office.

AIRCRAFT FOR SALE.

Authorised Moth Agents.—Immediate delivery. Deferred terms. Demonstrations arranged.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

AIR SURVEY.

Air Survey Co. Ltd., 39, Grosvenor Place, S.W.1 (Sloane 6048), Dum Dum, Calcutta, and Monkey Point, Rangoon.

The Aircraft Operating Co. Ltd., 8, New Square, Lincoln's Inn, London (Holborn 8131), and Bulawayo, Southern Rhodesia; Cairo, Egypt; Rio de Janeiro, South America: Contractors to the Ordnance Survey. Laboratories and Subsidiary Company for aerial photography in the British Isles, Aerofilms Ltd., Colindale Avenue, Hendon (Colindale 6581).

AIRCRAFT REPAIRS.

No job too small or too large. Complete reconditioning for C. of A. Full certificated staff—keenest rates. Brooklands School of Flying, Brooklands, Byfleet.

AIRCRAFT WANTED.

Aircraft purchased for cash. Cars taken in exchange for aircraft. Deferred terms.—Phillips and Powis Aircraft (Reading) Ltd., Reading Aerodrome. 'Phone Sonning 114.

Modern aircraft purchased for cash. Part exchanges for new machines.—Brooklands School of Flying Ltd. Telephone Byfleet 437.

PHONE:—DARLASTON 130.

SITUATIONS VACANT.

Aero-Engine Inspector.—Wanted assistant Chief Inspector, must be technically trained man, energetic, and with at least three years' experience in similar class of work. Apply Box No. 5696, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Aero Engine Pianning.—Wanted Assistant for Planning Department of aero-engine manufacture; must have had previous experience on this class of work, be progressive, and had sound technical training. Apply Box No. 5697, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

First Class Instrument Makers required immediately used to experimental and Aircraft Wireless Apparatus. State fully age, experience and rate per hour to Employment Department, Graham Amplion, Ltd., St. Andrews Works, Slough.

Fitters, erectors and tool makers, preferably used to aircraft construction, required immediately, District rate plus production bonus. Long job for capable men. Apply Westland Aircraft Works, Yeovil, Somerset.

Rate-fixer wanted, fully conversant with aircraft details. State salary and full particulars.—Saunders-Roe Ltd., East Cowes, Isle of Wight.

Wanted first-class Fitter to act as assistant to chief Tester at Speed Boat factory, must be used to high-speed engine work and good all round experience. Only first-class men need apply. Send fullest particulars to Box No. 5698, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound instruction in Aeroplane Design, Fitting and Riggiing, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, London, W.C.2.

PRACTICAL FLYING.

BROOKLANDS SCHOOL OF FLYING employs three pilots who have been instructing since 1916. Take advantage of their experience and let them teach you on a Moth or an Avro. Private accommodation on the aerodrome, which is only 50 minutes by rail or road from Waterloo. 'Phone: Byfleet 436-7.

HENDERSON FLYING SCHOOL.—Lt.-Col. Henderson offers unique terms both for "A" and "B" licences. All technical coaching arranged for. Personal attention. Minimum rates. Write to Croydon Aerodrome.

CINQUE PORTS Flying Club (Subsidised) gives cheapest tuition ever offered. Monthly sub. 21s. for 28 days. (No entry fee.) Annual subscription 63s. (entrance 21s.). Moth Equipment—Club-room, Bar and Lawn—Perfect Aerodrome near Folkestone, 1¾ road hours from West-End. No waiting list. Write Secretary, Hythe, Kent.—LEARN AT LYMPNE.

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

PHILLIPS AND POWIS SCHOOL OF FLYING—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths The School is very successful in turning out good pilots in a minimum of time. Write for particulars of recent successes. Make it a flying holiday. Special August offer, trial lesson 12s. 6d. 45 minutes Paddington.—Reading Aerodrome. 'Phone Sonning 114.

Surrey Flying Services, Croydon Aerodrome (Telephone Croydon 1736) have vacancies in their flying school for pupils at moderate rates. Avro aircraft used. Residential accommodation at Aerodrome Hotel.

Southern Aero Club.—Thorough Avro tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines, Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

SITUATIONS WANTED.

"B" Licence Pilot requires post, thoroughly experienced instruction and cross-country work. Excellent record. Moderate salary. Apply Box No. 5692, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Experienced Pilot, fly all types, requires a position near London as test pilot, demonstration salesman or technical adviser. Box No. 5694, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Experienced secretary shorthand typist requires progressive post. First-class experience, electrical, mechanical and aeroplane engineering, commerce, filing, etc. Accustomed responsibility. Good salary expected. BM/BY 43, London, W.C.1.

Gentleman age twenty. Three years' experience of motor trade. Thorough working knowledge of petrol engine. Willing accept position with flying School or Club, in return for tuition in Flying. References if required. Box No. 5695. The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Ground Engineer requires post. Licensed categories A and B. 15 years' Aircraft experience, workshops and inspection, reconditioning, complete overhauls. Box No. 5699, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

MISCELLANEOUS.

"Chequers Inn," Slaugham, Board Resident. Golf and coarse fishing half-mile. London 35 miles. Brighton 17 miles. Proprietor.

Reward £1.—Information leading to location and purchase Curtiss OX-5 Aeroplane Motors, new or used. Apply Box No. 5687, The Aeroplane, Cannon House, Pilgrim Street, E.C.4.

Petrolmotor Castings, partly machined ½ horse (9s. 9d. per set). Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

THE LATEST AVIAN

Fitted with the Genet Major engine which gives it a cruising speed of 90 m.p.h. the Avian is the most attractive plane so far produced for club or private use. It says much for this aeroplane that it has been chosen by many of the best clubs as their standard machine, and by many private owners for their personal use. It is small, light and handy, and not an expensive machine to run.

And, *prima facie*, it has the essential reliability, airworthiness and mechanical perfection of all Avro aeroplanes.

A full specification is available.

AVRO AVIAN

ON POSTPONEMENT OR CANCELLATION.

The sympathy of all in the World who are interested either in flying as a sport or in the development of aircraft as vehicles for transport will go out to Italian Aviation in the unfortunate state in which it now finds itself. By the death of Lieutenant Motta in Lake Garda on Thursday, Aug. 22, the *Regia Aeronautica* has lost a very able pilot who distinguished himself during the War 1914-1918. And in the breaking up of the various aircraft and motors specially built for the Schneider Trophy contest a severe blow has been given to that justifiable pride which Italy as a nation has taken in her aeronautical progress, to which Signor Mussolini and his able friend and helper General Balbo have given so much impetus in recent years.

Italy's preparations for the Schneider Trophy Contest have been made as far as possible in secret, just like our own. But such information as can be got indicates that 27 motors and ten aeroplanes have been built in Italy, with the intention that the three aircraft and their motors to compete in the contest should be selected from that number.

According to the accounts from Italy, only one aeroplane which has any chance of competing creditably is left of this fleet. For some reason the tandem-engined Savoia-Marchettis do not seem to have been a success, though whether this is because their performance is inferior, or merely because they were not built in time to be tested, is not yet known. Similarly, the twin-engined machine, with motors side by side, have not been successful. Last Saturday week (Aug. 17) the Fiat C29 was crashed in Lake Garda, happily without killing her pilot. And so all the responsibility has fallen on the Macchis, of which only one is left.

Somewhat naturally, under the circumstances, Italy asked for a postponement of the competition—apparently hoping that by delaying for a month some of the other machines, say the Savoias or reserve Macchis or something, might be fettled up for the competition.

A Matter of Rules.

The Royal Aero Club answered officially that according to the rules of the *Fédération Aéronautique Internationale* the Contest could not be postponed when once the date had been fixed except from day to day because of bad weather.

There is in fact precedent for such a postponement, because in 1926 the date of the Contest was postponed from October 24 until November 11 by the American authorities, because certain of the Italian material had not arrived. And the Contest was actually flown on November 13, when Major de Bernardi won.

The Contest was postponed then by mutual agreement between the only two countries,—Italy and America. But that postponement was considered by other nations, including Great Britain, to be contrary to the rules of the F.A.I. And so that contest should by right have been declared null and void.

Since then the F.A.I. has made a rule that the Contest shall be held once every two years. And a rule has been made that, in the January of the year preceding the year in which the Contest is to be held, the country in which the Contest is to be held shall fix a period of six weeks inside of which the Contest shall be held: and that three months before the holding of the Contest the actual date is to be announced. Thereafter that date can only be postponed owing to bad weather.

There are the rules, and we are bound to stick by them.

Moreover, this year there are not two countries only concerned. There is also the American representative to be considered. Whether Lieutenant Williams, U.S.N., will get here in time for the date fixed or not, nobody knows. But anyhow, so far as can be learned, the Aeronautical Association of America, which corresponds to our Royal Aero Club, has not asked for a postponement.

On Saturday last Lieutenant-Colonel Bitossi announced to the British Press that Italy had definitely withdrawn from the Contest. But we still have to reckon with an American competitor.

Packing The Packard.

According to the last story from the States Lieut. Williams was then having a new Packard engine put into his machine. This story, which is quite good whether it be true or not, is that he had intended shipping a new engine, and having it fitted to his machine on the way over, so as to keep it absolutely secret from everybody except the specially picked mechanics in the Packard Works who have been building it.

AN ITALIAN PRACTICE MACHINE.—The Macchi M.52 bis (1,000 h.p. Fiat A.S.3 engine) which holds the World's Speed Record for seaplanes at 318.4 m.p.h. and will be used as a practice machine for the Italian team at Calshot.

Digitized by Google

This may be true, but it is very unlike the open way in which everything is done in the States. And anyhow it does not match up with the U.S. Navy's very wise ruling that they will not let Lieut. Williams and his machine come over here until he has shown them that it can fly.

Thus, at the time of writing, the Royal Aero Club, which is the party most concerned, has had no official intimation from the Italian authorities that they have withdrawn, and it has no information that America has withdrawn. An evening newspaper states definitely that the Italians are coming with two Savoias, two Macchis and a Fiat. But they may not arrive or may not fly when they do arrive. So there is a distinct probability that on the day fixed for the Contest we shall find ourselves perfectly ready to compete, and without any competitors. And the question is what are we going to do about it?

Solving The Problem.

That question resolves itself into three alternatives. Are we going to be sportsmen and cancel the Contest? Or are we going to be commercial and fly over the course and claim a win? Or are we going to let the English Non-Conformist Conscience get to work, and by pretending to be good sportsmen actually be thoroughly commercial in the most far-sighted way possible? That is, cancel the Contest as a gesture to our competitors and then send our own defenders to break all existing records—and afterwards advertise the fact all over the World that British Aircraft Break Records Without Breaking Themeselves.

If we consider the question purely as sportsmen we shall declare the Contest off, just as the U.S. Navy did in 1924 when our one machine crashed and we sent the designer and the pilot to America without any machine.

If we are going to behave like ordinary short-sighted shopkeepers, we shall fly our machines over the course and then claim a win on the Trophy. The result will be that all our possible competitors, the Americans, the French and the Italians, will in future say that of course it was all very fine for us to secure a win becaues we had nothing up against us, and that any of them could have beaten us if we had waited for them to be ready.

The fact that they have all had two clear years in which to build new aircraft to beat our one machine which won the Trophy for us in 1927 at Venice will not count in the argument. The bald fact remains that our foreign competitors have failed to be ready in time, just as we ourselves have failed to be ready in time, so often in so many things, from the outbreak of War in 1914 upwards and downwards.

England The Unready.

One remembers very well on that famous morning in 1924 when the U.S. Navy so sportingly cancelled their right to fly over the Course, and claim a win on the Schneider Trophy, at Baltimore, that an Englishman walked into the hotel at breakfast-time and was introduced to a group of American Naval Air Service officers, who cooed over him sympathetically about the mishap to the English challenger.

Somewhat tactlessly he announced that they would be interested to know that work had already begun on next year's challenger. Whereupon another Englishman remarked that he was glad to hear it, because we should then have a chance of finishing the machine on the boat on its way to America next year.

When the Contest was held a year later we still were not ready, for the only British machine that covered the course was consistently 30 miles an hour slower than the American winner, lap after lap of the course. And our management was so bad that when one of our machines crashed before the Contest our reserve machine was not even assembled and ready to fly.

The trouble with all scientists and artists is that they are never content to let well alone and do the best they can with what they have produced. They will always go on trying to improve things, instead of making existing things reliable. Several of the best aircraft designers in the World have never had a chance of showing how good their products are simply because they have never had a business man to take their designs away from them and to make them stop improving them.

That probably is what is at the bottom of the Italian and French failure to be ready in time. They have probably allowed their designers to go on introducing new ideas, instead of stopping the designs six months ago and simply finding out the weak spots in their aeroplanes and engines,—in other words, getting the bugs out of them, as they call it in America.

A Suggestion and a Precedent.

Anyhow, here we are, apparently, without anybody to put up a competition against us. Or at best with only one Italian machine and one American machine. So what are we going to do, and what are a few million British taxpayers who have helped to pay for the Schneider defenders, going to do on September 7 if it should happen to be a nice fine day and affords no excuse for postponing the Contest?

Certainly the best thing we can do is to adapt what the Americans did at Baltimore in 1924. That is, quite simply, to hold a Seaplane Meeting of our own. The Americans, having declared the Contest off, sent their machines over the Schneider course to go for records, and organised some quite interesting races for their standard Naval float seaplanes and flying boats.

We can do better than that, for, as Mr. Colebrook of *The Times* has suggested, we can have a team race between the two Gloster Napiers and the two Supermarine Rolls-Royces. To this we may add, if so desired, a Gloster and a Supermarine of the 1927 vintage which would make interesting tails to the teams.

This idea is very well worth working. The rivalry between an Italian team and a British team would be nothing when compared with the rivalry between two British teams. A civil-war is always far more bitter than an international war.

One has always claimed that given command of the press, and the removal of the police, one could work up a bloody war within six weeks between Liverpool and Manchester, or between Edinbugh and Glasgow. And for years we have been living on the verge of war between Belfast and Dublin. So there need be no fear of lack of keenness in such a competition as Mr. Colebrook has suggested.

On top of that we could give the taxpayer a magnificent display of seaplane work by the R.A.F.; for Portsmouth has just been having a Navy Week, and the Fleet Air Arm

THE AMERICAN CHALLENGER.—A front view of Mr. Williams' Mercury monoplane on the water at the U.S. Naval Air Station at Annapolis, Md.

ELEVEN years' development and improvement has made the Napier Lion the finest aero engine in the World.

The British Government and 20 other countries are obtaining complete satisfaction from this famous British engine.

The Napier is selected because it has proved over and over again that it can be relied upon. No other engine has such a record of reliability.

Napier engines were installed in the four Supermarine-Napier "Southampton" flying boats which made the greatest formation flight ever attempted. These machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

The fastest speeds ever attained in the air and on land were secured with machines fitted with the Napier engine.

The first non-stop flight from England to India was carried out with a Napier-engined Fairey monoplane, when 4,130 miles were covered in 50 hrs. 38 mins.

Secure the greatest efficiency by installing the

D. NAPIER & SON LTD.
ACTON, LONDON, W.3

Digitized by Google

assisted by the Navy at Portsmouth might very well give a display of what can be done in the way of catapulting aeroplanes off warships and flying them off the decks of carriers.

One feels sure that the nobility and gentry assembled on the *Orford* and *Orontes*, not to mention the mere commoners on the steamships engaged by our old friends Mr. Thomas Cook and his Sons, and the Aero Club's day-trippers from Town, would greatly admire to have such an exhibition staged between those vessels and Ryde Pier,—on which apparently are likely to be assembled also most of the profiteers of the Isle of Wight,—resident and visiting.

Excellent displays could be given by flying-boats from Calshot and Cattewater. A race might be arranged for standard type float-seaplanes and for standard type deck-flying machines of the Fleet Air Arm. Squadrons of big bombers could come over from Salisbury Plain and Manston. In fact there is no reason why the R.A.F. should not put up a pageant for the Fleet Air Arm and the Coast Defence Stations.

A Business Proposition.

This excellent suggestion of Mr. Colebrook's is not supported because one has any sympathy for the people who are trying to enrich themselves by running trips to the Schneider Contest, nor for the lodging-house keepers of the Isle of Wight, nor for the hotel-keepers of Southsea or Portsmouth. The reason is merely that all our daily papers have been worked up to the point of getting their half-witted readers thoroughly excited about air speeds so we may as well show them what speed is. And as so many people have definitely arranged bits of their holiday to go and see what real speed looks like, whether we have foreign competitors or not will make no difference to the public. Our machines will be travelling just as fast as any of the foreign machines would have travelled, and anyhow, even to the trained eye,—unless it has become accustomed to machines passing definitely along one line of country,—there is practically no difference at all between an aeroplane travelling at 250 m.p.h. and one travelling at 350 m.p.h.

In fact, if there are no foreign competitors, and if we have our own team-race all to ourselves, there will be more time left in which the Fleet Air Arm and the Coast Defence Stations can put up a good show.

Practically no organisation is needed beyond a little regulating of times for the different events by the R.A.F., and the Air Force is used to doing that. The arrangement for handling crowds and housing them and so forth has already been done—and it will not be done any better or any worse because of the absence of foreign competitors.

It Pays To Advertise.

Therefore, let us have our sea-going air display and get all the publicity we can out of it,—just as the Silent Service does with its Navy Weeks. If we merely cancel the whole show our various foreign competitors will say we are very good sportsmen and very big fools. If we fly over the course and claim a win on the Trophy, everybody will say that we are commercially minded and bad sportsmen. But if we refuse to claim the Trophy and put up a good show and beat all the World's Records for speed,—from the absolute speed record over the measured three kilometres course all the way up to 250 kilometres,—then we shall have the credit of being good sportsmen, and we shall get a splendid advertisement for our aircraft. And we shall have given several hundreds of thousands of people an air display such as they could not see anywhere else in the World and to that extent we shall have made them air-minded. In other words we shall have cast our bread upon the waters, and it will return unto us after many days, plus that profit which is so consistently promised to all right-doers by the best people.—C. G. G.

THE WEEK AT CALSHOT.

Preparations for the Schneider Trophy Contest are going on at Calshot in that calm, unhurried manner which is such an amusing contrast with the confused excitability of certain civilian organisations concerned with the Contest. The entire fleet of sea-going surface craft of the R.A.F. is being concentrated at Calshot and, under Wing Cdr. B. L. Huskisson, D.S.C., will operate from there during the Contest for transport, communications, patrols and ambulance work.

On Aug. 2, officially timed speed runs were made over the

How To See The Solent Show.

FAIREY
AIRCRAFT

THE FAIREY AVIATION COMPANY LTD. ♦ HAYES ♦ MIDDLESEX.

Digitized by Google

course with the first Supermarine-Rolls-Royce S.6 piloted by Flg. Off. H. R. D. Waghorn. No speeds were divulged at that or any other time to the Press and readers of the daily press can therefore assume with perfect safety that the speeds given to them exist, so far as these machines are concerned, in the too vivid imaginations of the respective Air Correspondents. An improved timing apparatus was used on this occasion which, so far as one can gather, consists of a cinema apparatus combined with a tuning fork. The latter is set to make 20 vibrations a second and controls a rotating metal shutter with perforated numbers inside the camera. These are photographed at the same time as the passage of the machine across the lens. The apparatus is claimed to record speed within 100th part of a second.

After he had flown over the course Mr. Waghorn made various other tests with the machine, including a trial of its stalling-speed. He finished a forty-minute flight with some steeply-banked turns over the air station in the course of which he came down to within a few hundred feet of the roofs of the sheds. This latter part of that flight caused so much perturbation to the Italian team's special cook—who incidentally is not as was supposed, a stranger in a strange land, but a famous chef who has been in London for nineteen years—that he disappeared and was not discovered for several hours afterwards.

The S.6 had just alighted on the water when the *Mauretania*, swollen with American millionaires and self-esteem and with very much blackened funnels, came up the Solent at a most reckless speed. Frantic signals from Calshot plus uncurbed expressions of distaste for her and all her kin did not deter this "Queen of the Atlantic" from her unladylike behaviour and the S.6 was very nearly engulfed in the subsequent wash. At the same time the new Gloster-Napier VI was on the slipway ready for her first floating tests but she was hurriedly hauled back out of danger. This machine was launched again later and put through her taxy-ing trials by Sq. Ldr. Orlebar.

Late that night the first cases containing the Italian Team's practice machines arrived at Calshot. The cases had been sent by train and ferry to Harwich and thence by road. Some of the non-commissioned officers and men of the team also arrived.

News arrived at Calshot that the Navy Department of the U.S.A. had refused permission to Lieutenant Alford Williams to send his machine to England to compete until it had been given a further trial.

One of the best stories at Calshot concerns the member of the staff of the excellent temporary Post and Telegraph Office on the Station, who innocently went past the guard by jumping a lift on the back of the fire tender. The driver was unaware of his passenger, but the sentry spotted him, so the guard was turned out and a careful and systematic search was made for the "spy."

Eventually somebody had the bright idea of asking the various civilian organisations camped at the station who had ridden in, with the result that the culprit owned up at once, blissfully unconscious of the enormity of his crime.

On Aug. 22 the wind at Calshot had increased to between 15 and 20 m.p.h. on the surface and up to 25 m.p.h. at 2,000 ft. The Gloster machine was launched and pulled onto a float. The float was then towed about four miles in the direction of Lee-on-Solent. However a heavy swell was running and Sq. Ldr. Orlebar decided not to take the machine up. During the afternoon the second Supermarine-Napier arrived from the Supermarine works in tow behind a motor-boat and was landed and her engine run up. The first Supermarine, having completed three hours in the air, was taken back to the works where her engine will be dismantled for a complete overhaul.

R.A.F. personnel and the Italian mechanics were busy in the Italian hangar all day unpacking and erecting the two Macchi machines which are to be used for training. All the competing machines are housed in the big shed which normally belongs to No. 201 (Flying-Boat) Squadron. Partitions have been built to separate the competing teams. No. 201 (Flying-Boat) Squadron has been sent to Rosyth where the boats are anchored out. The personnel are quartered at Donibristle. Press representatives were duly impressed, not to say thrilled, with the fact that an armed guard was mounted at the sheds for the first time on the evening of this day. There was very little else to be thrilled by as there was no flying at all, and a very poor catch in the super-optimists's lobster-pot.

On Aug. 23 the wind had increased 25 m.p.h. on the surface and was squally higher. A Service Southampton arrived early from No. 204 (Flying-Boat) Squadron, Cattewater, and anchored. It left later to escort H.R.H. the Prince of Wales across the Channel in a Moth piloted by Sq. Ldr. Don.

At midday the Chief of the Air Staff, Marshal of the R.A.F. Sir Hugh Trenchard arrived by flying-boat from Cattewater for an unofficial visit to the High Speed Flight.

The news of the fatal accident to the second-in-command of the Italian Schneider Team reached Calshot during the morning. Capt. Giuseppi Motta was testing a new S.67 seaplane at Desenzano on Lake Garda when after a few minutes' flight the machine dived into the water from a height of about 300 feet. The wreck has not yet been recovered.

Later in the day the Italian Air Attaché in London asked the Royal Aero Club of Great Britain for the postponement of the contest for one month. At a meeting of the Royal Aero Club the Attaché was informed that the rules of the *Fédération Aéronautique Internationale* did not permit the Club to postpone the contest.

On Aug. 24 unsuitable weather again prevented any flying in the new machines.

On Aug. 25 the Gloster-Napier VI was towed on one of the pontoons out into the Solent and Sq. Ldr. Orlebar made a trial flight with the machine. After making a taxy-ing test Sq. Ldr. Orlebar flew the machine for a few seconds. A minor trouble developed in the petrol feed and the machine was towed in again. Later Sq. Ldr. Orlebar tested the second Supermarine S.6. He took the machine four times over the speed course and put it into some steep banks.—C. M. MCA.

THE SCHNEIDER TROPHY COURSE.

An Air Ministry Notice to Airmen makes the following regulations which are illustrated by a sketch map:—

1. Flight in the neighbourhood of the Schneider Trophy Contest will be subject to the following restrictions:—

(*a*) During the period from 24.00 hours B.S.T. on 5th September 1929, to 24.00 hours B.S.T. on 19th September, 1929, or to 24.00 hours B.S.T. on the day on which the Schneider Trophy Contest is completed, whichever is the earlier, no aircraft other than aircraft competing in the Contest, may fly over the area bounded as follows:—

Straight lines joining Yarmouth Pier, Lymington Pier and Netley Castle. High-water mark between Netley Castle and Hamble Spit. Straight lines joining Hamble Spit, Cosham railway station, Selsey Bill coast-guard station, Bembridge railway station and Gurnard village. High-water mark between Gurnard village and Yarmouth Pier.

(*b*) During the same period, no kite or fixed balloon may be flown over the area bounded as follows:—

Straight lines joining Yarmouth Pier, Lymington Pier, Woolston Ferry (Southampton), Cosham railway station, Selsey Bill coast-guard station, Bembridge railway station and Yarmouth Pier.

2. It should be observed that Cowes seaplane station, which was notified in Notice to Airmen No. 32 of 1929 as available for use by visitng marine aircraft lies within the prohibited area described in (*a*) above. Aircraft desiring to use this seaplane station must, therefore, arrive before the commencement of the period of prohibition defined at (*a*) above, and will not be free to depart until the period is concluded.

A SCHNEIDER SOUVENIR.

The Royal Aero Club have placed on the market an official souvenir programme of the Schneider Trophy Contest, 1929, price 1s. It contains a history of the Contest for the Schneider Trophy contributed by the Editor of *Flight*, some interesting remarks on speed and power by Mr. C. G. Colebrook of *The Times*, the Rules of the Competition as laid down by the *Fédération Aéronautique Internationale*, various remarks on the Contest of 1929 by Lieut.-Col. W. A. Bristow and by Major R. H. Mayo, some laudatory remarks by Lord Thomson and M. Laurent Ey, a few colour pictures of Schneider speed machines—some are badly out of drawing—and a number of illustrations which are printed in that irritating chocolate-coloured ink and are about as badly produced as any pictures that has ever seen. In kindness to the printers and publishers one refrains from mentioning them. But the Aero Club wants 1s. for the publication,—which will not impress foreign visitors with our capacity as producers of artistic printing.

THE DANGER POINT.

A regular reader writes:—

I trust that I have been wrongly informed, for the safety of water-borne during the period of the Schneider Trophy Contest, I say that I have heard that the S.S. *Orford* is going to be gated personally by Commander Perrin.

Our reader's terrors may be allayed. Lt.-Comdr. P will be in command of Ryde Pier, which can only be a sive and not an active participant in any marine col which may happen,—though one does not guarantee Pier against temperamental collisions.

One is able, also, to deny the rumour that Lt. C Perrin was doing a trick at the wheel of the S.S. *Orfo* way of practising for the Schneider Course, when about-to-be-historic vessel took the mud at Copen recently.—C. G. G.

CIRRUS HERMES

AN APPRECIATION!

The following are Extracts from a letter received from Mr. J. E. Carberry.

"With reference to my participation in the Challenge de Tourisme Internationale with my CIRRUS 'HERMES' engined machine, and in which I was successful in returning the fastest time over the course of approximately 4,000 miles round Europe, I wish to take this early opportunity of congratulating you upon the remarkably efficient running that was given by the engine throughout the race."

"Throughout the 4,000 miles flight the CIRRUS 'HERMES' engine ran splendidly and demonstrated the inherent characteristics of efficiency and reliability."

THE "GRAF ZEPPELIN."

On Aug. 23, at 15.14 hrs. (Tokyo Time) the *Graf Zeppelin* left Kasumigaura Naval Air Station near Tokyo for Los Angeles on the third stage of its flight round the World. Its departure had been delayed a day owing to the accidental breaking of a strut of the rear engine gondola while the ship was being walked out of its shed. This was repaired in twelve hours and further delay was then caused by unfavourable weather and thunderstorms.

On the same day at 16.00 hrs. (G.M.T.) the ship wirelessed its position as latitude 36 deg. N. and longitude 151 deg. E. or about 600 miles from Tokyo.

Through Saturday and Sunday she was forging ahead at speeds varying from 60 to 90 m.p.h. and at 08.15 hrs. on Aug. 25 she announced her position as latitude 41 deg. N. and longitude 144 deg. E., or about 1,320 miles from Los Angeles.

On Aug. 26 at 05.11 hrs. (Pacific Coast time) the *Graf Zeppelin* landed her 19 passengers at Los Angeles after having flown the 5,800 miles from Tokyo in 68 hrs. 14 mins.

The ship was actually sighted 15 miles from the Golden Gate, San Francisco, at 18.00 hrs. the previous evening. She was met by a flock of aircraft carrying newspaper correspondents and photographers and a convoy of Army aircraft and conducted over the city of San Francisco. By 01.16 hrs. she was over Los Angeles, but to avoid risk of damage by landing in the dark she flew round in circles until dawn.

Only 10,000 people, of whom 2,000 were military, naval and civil police and the ground crew, were admitted to the aerodrome before the ship landed, but over the surrounding country and on the roads twice as many more were awaiting its arrival.

The crew and passengers of the ship were entertained at a banquet in the evening.

ANOTHER ATLANTIC FAILURE.

On Aug. 19, M. Oscar Kaesar and M. Kurt Luescher, two Swiss aviators, left Lisbon in an attempt to fly across the Atlantic in a Farman F.190 monoplane (230 h.p. Gnôme-Rhône Titan).

The route chosen was across the Azores, and the machine was seen passing over one of these islands on the same day. Since then no further information about the machine or its crew has been received.

M. Kaeser will be remembered as the sportsman who flew from Zurich to Bombay in a Comte "Gentleman" light aeroplane last year.

THE STOCKHOLM—NEW YORK ATTEMPT.

Captain Ahrenberg, who has passed the mid-summer months in an attempt to fly to New York from Stockholm via Iceland and Greenland, has abandoned his attempt.

Captain Ahrenberg and his crew are returning to Copenhagen by boat bringing their seaplane with them.

SPOKANE—NEW YORK—SPOKANE NON-STOP.

On Aug. 17, Mr. N. B. Namer and Mr. A. Walker left Spokane, Wash., in the Buhl biplane *Spokane Sun God* to fly to New York and back without a stop.

They reached New York on the following day, after having taken in petrol, oil and food three times *en route* from other machines. They were again re-fuelled and re-victualled over Roosevelt Field, Long Island, N.Y., before starting on the return trip.

They landed at Spokane on Aug. 20, again after having been refuelled three times between New York and Spokane.

The total distance covered was approximately 7,200 miles, and the flying time was 120 hrs. 2 mins.

A NEW HEIGHT RECORD.

A report in *The Times* states the altitude record for aeroplanes carrying a weight of 500 kilogrammes (about 1,100 lb.) is reported to have been broken on Aug. 23 at Toussus-le-Noble by an aviator named Burten in a Bréguet biplane with a 500 h.p supercharged Farman engine. The barograph machine recorded a height of 9,500 metres (31,168 ft.). The previous record was 9,188 metres (30,145 ft.).

U.S. AIRCRAFT FOR MEXICO.

The Mexican Government has acquired twelve Vought Corsair two-seat reconnaissance biplanes (Pratt and Whitney Wasp engines).

These machines were originally contracted for during the last Mexican revolution, and the first nine were delivered by the Chance Vought Corporation seven days after receiving the contract.

The last three of the order left New York for Mexico City on June 9, but as the revolution had by then been suppressed, their delivery was not so urgent.

The Vought company has also sold Corsairs to the Argentine, Cuba, and Peru. The export business of the company during the first five months of 1929 has amounted to $750,000 (£150,000).

A MEDITERRANEAN AGREEMENT.

A report in *The Times* of Aug. 27 states that an Air Agreement between Spain and Italy was ratified on Aug. 26 by the Spanish Prime Minister and the Italian Ambassador to Spain.

LORD EDWARD GROSVENOR.

Everybody who has ever met him will learn with sorrow of the death of Lord Edward Grosvenor, who died on Aug. 26 in the Isle of Wight after a long illness.

Edward Arthur Grosvenor, was born in October, 1892, the ninth son of the first Duke of Westminster. He was a son of the Duke's second marriage and so was considerably younger than his nephew the present Duke.

He was educated at Eton, and was given a commission in the Royal Horse Guards in 1912. In the following year he learned to fly at the Bristol School at Brooklands. His certificate, No. 607, is dated Aug. 29, 1913. Thereafter he bought a 50 h.p. Blériot monoplane and did a considerable amount of flying at the Blériot School at Hendon.

On the outbreak of war he transferred to the Royal Naval Air Service. His two Blériot monoplanes were taken over by the Admiralty. And he crashed one of them himself at Dunkerque, in the retreat from Antwerp.

He served with the R.N.A.S. in France and Italy. And was awarded the Order of St. Maurice and St. Lazarus by the Italian Government.

After flying aeroplanes in France he transferred to kite balloons and was one of the first officers to give serious attention to the problems of bombing. Those who served with him at Roehampton will remember his bomb-dropping experiments from kite-balloons. When he went to Italy he served with airships. Later on he returned to France and became a Wing Armament officer, specialising on bombs and machine-guns.

After the War, when the Auxiliary Air Force came into being Lord Edward Grosvenor was appointed to command No. 601 County of London (Bomber) Squadron as Squadron Leader with date Aug. 1, 1925.

In 1914 he married Lady Dorothy Margaret Browne, elder daughter of the 5th Earl of Kenmare, by whom he had two daughters.

Ned Grosvenor, as he was generally called, was one of the most wholly amiable men whom one could hope to meet. All who have ever served with him or under him will bear witness to his good nature and kindness of heart. Above all he had an exquisite sense of humour, and any time spent in his company was an entertainment in itself. He was intensely keen on the Service and made his Auxiliary Squadron his chief hobby.

Early in the development of Civil Aviation after the War he showed his interest in sporting flying by presenting to the Royal Aero Club the Grosvenor Cup which is one of the very few trophies which rouses interest among our sporting aviators.

On few men is the gift conferred of being missed as many of us will miss Edward Grosvenor.—

C. G. G.

Edward Grosvenor.

THE ROYAL AIR FORCE.

The London Gazette.

Aug. 20.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Lt.-Cdr. H. L. St. J. Fancourt, R.N., is re-attached to the R.A.F. as a Flg. Off. with effect from Aug. 1, and with seniority of June 16, 1924; Lt.-Cdr. R. St. A. Malleson, R.N., is re-attached to the R.A.F. as a Flt. Lt. with effect from Aug. 1 and with seniority of Mar. 8, 1927.

The following Plt. Offs. on probation are confirmed in rank:—K. G. Vandyck (Aug. 2); F. K. Wood (Aug. 7).

The following Plt. Offs. are promoted to the rank of Flg. Off.:—H. J. Cross (Jan. 8) (substituted for the notification in the *Gazette* of June 21), A. G. Lester (April 9); A. W. Hunt (June 17); J. B. Mackenzie (June 30); J. H. T. Simpson (June 30); N. C. Odbert (July 9); E. J. H. F. Moreton (July 13); W. R. C. Wilkins (July 15); B. W. Piggins (July 15).

Flt. Lt. F. L. Luxmoore, D.F.C., is placed on the retired list at his own request (Aug. 3); Flg. Off. M. F. Morris is placed on the retired list on account of ill-health (Aug. 17).

The following cease to be attached to the R.A.F. on return to Naval duty (Aug. 1):—LT.-CDR., R.N., FLG. OFF., R.A.F.—J. H. I. Wood. Lrs., R.N., FLG. OFFS., R.A.F.—G. C. Dickins, L. G. Richardson, J. E. Vallance, T. H. Villiers.

The S.S. comn. of Plt. Off. on probation F. N. D. Scally is terminated on cessation of duty (July 23).

RESERVE OF AIR FORCE OFFCERS.

GENERAL DUTIES BRANCH.—W. T. Taylor is granted a comn. in Class A.A. (ii) as a Plt. Off. (Aug. 7).

The following are granted comns. in Class A.A. (ii) as Plt. Offs. on probation.—T. G. E. Price (Aug. 1); G. P. E. Howard (Aug. 7); H. C. Devitt (Aug. 8). P. Bailey is granted a comn. in Class A as a Flg. Off. on probation (Aug. 10). The following Plt. Offs. on probation are confirmed in rank:—M. G. B. Clark (Aug. 11); A. G. Douglas (Aug. 13); E. F. Briscoe (Aug. 14); M. F. Ogilvie-Forbes (Aug. 20). The following are transferred from Class A to Class C.—Flt. Lt. S. H. Potter (July 26); Flg. Off. J. F. Dewar (May 12); Flg. Off. J. F. Nicolas (Feb. 28). The comns. of the following Plt. Offs. on probation are terminated on cessation of duty.—R. S. Odd (July 31); G. J. Konried (July 25).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 605 COUNTY OF WARWICK (BOMBER) SQUADRON.—The following to be Plt. Offs.—J. V. Wood (July 18); R. P. Gibb (July 19).

Appointments.

Week ending August 26.

GENERAL DUTIES BRANCH.—Group Captain H. M. Cave-Browne-Cave, D.S.O., D.F.C., to 205 (Flying Boat) Squadron, Singapore, 9/8, to Command.

Wing Commanders B. E. Smythies, D.F.C., to Station H.Q., North Weald, 10/8, to Command. G. S. M. Insall, V.C., M.C., to Station H.Q., Donibristle, 10/7, to Command. G. H. Bowman, D.S.O., M.C., D.F.C., to H.Q., Inland Area, 9/8, for Air Staff duties.

Squadron Leaders L. H. Cockey, to H.Q., Inland Area, 13/8. A. G. Bond, A.F.C., to H.Q., Coastal Area, 12/8.

Flight Lieutenants A. R. Churchman, D.F.C., to No. 2 (A.C.) Sqdn., Manston, 16/8. T. B. Bruce, M.C., to Experimental Section, R.A.E., So. Farnborough, 3/8.

Flying Officers R. L. Burnett to R.A.F. Depot, 13/7. R. T. Read to E. and W. School, Cranwell, 15/7. W. J. Coadwell, D.S.M., to R.A.F. Depot, 25/7. J. E. Allen, to No. 9 (Bomber) Sqdn., Manston, 10/8. G. V. Carey, to C.F.S., Wittering, 6/8. G. B. Beardsworth, to H.A.D., Henlow, 13/7.

Pilot Officers E. H. Jennings to No. 2 Armoured Car Company, Middle East, 9/8. A. C. P. Westhorpe to Armoured Car Wing, Hinaidi, 9/8.

STORES BRANCH.—Squadron Leader W. C. Clark, to H.Q., A.D.G.B., Uxbridge, Middlesex, 15/8.

Flying Officer P. H. Wilcox to Supply Depot, Aden, 10/8.

ACCOUNTANT BRANCH.—Flight Lieutenant J. L. Armstrong to Station H.Q., Upavon, 24/7. F. W. Arthurton, to R.A.F. Base, Calshot, 1/9.

Flying Officer V. H. Lewis to No. 2 (A.C.) Sqdn., Manston, 8/8.

CHAPLAINS BRANCH.—The Rev. D. F. Blackburn to H.Q., R.A.F., Cranwell, 8.7.

LEGAL BRANCH.—Flight Lieutenant G. S. Marshall, O.B.E., to H.Q., Middle East, 9/8.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident at Heliopolis, Egypt, to a Victoria machine of No. 216 (Bomber) Squadron, Heliopolis, on Aug. 24, 86011 Sjt. John Melville, the first pilot of the aircraft, Plt. Off. John Wilson, the second pilot of the aircraft, and 335956 L-AC. Charles Ernest Langan, were killed. Of the three other members of the crew, 354179 L-AC. Mervyn Henry Creed was dangerously injured and died in Station Sick Quarters, Heliopolis, on Aug. 25, 363187 AC.1. Frank Wilfred Mabbett was dangerously injured and 335284 Sjt. Sydney Deacon slightly injured.

The Riots in Jerusalem.

The precautions taken by the authorities following the rioting and disturbances which occurred at the Wailing Wall in Jerusalem on August 23 and 24 included the despatch by air of two officers and fifty men of the South Wales Borderers from Egypt to Palestine. The rest of the battalion travelled by train.

On Aug. 25 the War Office made the following announcement:—

At the request of the High Commissioner for Palestine, the Governor and Commander-in-Chief, Malta, has been instructed to dispatch the 2nd Battalion, The South Staffordshire Regiment, to Palestine, on board H.M. Aircraft-carrier *Courageous*.

The first detachment of Infantry arrived in Jerusalem by troop-carrying aeroplanes within seven hours of the decision being taken to send troops from Egypt.

The official communiqué, which was issued in Jerusalem on the evening of Aug. 25, includes the following reference to the R.A.F.:—

Hebron.—A serious attack on the Jewish quarter of Hebron yester day morning resulted in heavy loss of life. It is reported that more than 45 Jews and eight Moslems were killed, and more than 59 Jews and 10 Moslems wounded. A strong detachment of Royal Air Force *personnel* and British Police was despatched from Jerusalem and re-established order. They are remaining at Hebron for the present. The Jewish population of Hebron has been evacuated from the Jewish quarters and accommodated in the Police barracks under guard.

General.—Aircraft and armoured cars from Amman are now operating in various parts of Palestine; a detachment of 50 British troops from Egypt arrived yesterday evening by air and took up position in

AN OFFICIAL VISIT.—Marshal of the R.A.F., Sir Hugh Trenchard, Chief of the Air Staff, visiting the High Speed Flight at Calshot. On Sir Hugh Trenchard's right is Grp. Capt. Nanson, O.C. R.A.F. Base, Calshot, and behind them are the officers of the High Speed Flight.

Jerusalem; 600 British troops from Egypt arrived in Palestine this afternoon, and a further 450 troops will arrive to-morrow. H.M. cruiser *Sussex* arrives at Jaffa from Malta to-morrow morning and will land a party; H.M. battleship *Barham* will arrive at Jaffa from Malta on Tuesday morning and will land a party if necessary. The situation is well in hand.

The R.A.F. Units in Transjordan and Palestine are Headquarters at Amman, No. 14 (Bomber) Squadron at Amman, No. 2 Armoured Car Company (H.Q. and two Sections) at Amman, a Supply Depot, and a Hospital at Sarafand, Meteorological Stations at Amman and Ramleh and W/T Stations at Jerusalem and Ma'an.

No. 14 (Bomber) Squadron is equipped with D.H.9as and is commanded by Sq. Ldr. E. G. Hopcraft, D.S.C.

The Royal Air Force College.

The Air Ministry announces that the following Flight Cadets successfully completed on July 26 their course of training at the Royal Air Force College. The names are arranged in alphabetical order:—

Barrett, G. G., Burke, W. I. H., Cole, F. C. (winner of R. M. Groves Memorial Prize), Corbally, E. J., Crocker, L., Douglas-Hamilton, Lord M. A., Douthwaite, D. J., Drew, F. R., Fairtlough, G. K., Heath, M. L., Hebden, W. S., Hood, H. R. L., Keary, R. C., Lane, D. W. (winner of Air Ministry Prize for Aeronautical Engineering), Lewis, K. P., Lucas, L. E. J., Mead, R. C., Molesworth, A. O., Murray, S. S., Newbigging, I. B., Niblett, K. W. (winner of Sword of Honour), Phillips, R. L. (winner of Abdy Gerrard Fellowes Memorial Prize), Pollock-Gore, F. A. J., Powell, J. A., Selway, A. D., Simonds, E. R., Spendlove, W. V. L., Stannard, F. W., Vintras, R. E. de T. (winner of Air Ministry Prize for Humanistic Subjects), Watt, C. A., and Wightman, W. T. F.

The Engineering Course.

The following officers of the R.A.F. have successfully passed the Engineering Course which ended at the Home Aircraft Depot, Henlow, on June 30 and are granted the symbol E in the Air Force List:—

Flight Lieutenants.—C. E. H. Allen, N. Carter, G. D. Daly, F. G. Gibbons, H. A. Hamersley, H. O. Long, A. E. Paish, B. K. D. Robertson, G. J. Southam, R. A. B. Stone, W. A. Tattersall, A. J. Warwick and H. M. S. Wright.

Flying Officers.—J. M. Cohu, C. D. Green, A. W. B. MacDonald, H. G. M. Parker, J. H. C. McC. Reynolds, G. B. M. Rhind and A. H. Wheeler.

The following have been selected to attend Cambridge University course "A," beginning on July 8, 1929:—

Flight Lieutenants.—C. E. H. Allen and H. M. S. Wright.

Flying Officers.—J. M. Cohu, A. W. B. MacDonald and G. B. M. Rhind.

The R.A.F. and Fishery Protection.

A report appeared in a number of daily papers recently to the effect that the vigilance of Flg. Off. L. L. King, R.A.F., while on fishery protection flying patrol in the North Sea, has resulted in the conviction of the Master of a French trawler on the charge of fishing within the three-mile limit.

The Air Ministry have informed The Aeroplane that the duty of fishery protection has not been taken over from the Royal Navy by the R.A.F. in whole or in part, but that reporting the presence and activities of such vessels in British waters is included in the duties of the crew of any R.A.F. seaplane or flying-boat engaged on normal patrol duties.

According to the current Air Force List, Mr. L. L. King is attached to the Flying-boat Development Flight, R.A.F., Felixstowe.

H.M.S. Argus.

The appointment of Captain C. A. M. Sarel, O.B.E., to command the Aircraft-Carrier *Argus* is dated Aug. 27.

The Pembroke Air Base.

Mr. George Hall, M.P., Civil Lord of the Admiralty, in a statement made on Aug. 20, said that the Admiralty had agreed to representations made by the Air Ministry to delay the establishment of the Air Base at Pembroke Dock until Jan. 1, 1930.

Mr. Hall also said that between 90 and 95 per cent. of the dockyard would be taken over.

International Courtesies.

An *Exchange Telegraph* message from Athens dated Aug. 26 states:—

The captain and crew of the Greek steamer *Hermes*, who were shipwrecked off the coast of Arabia, east of Aden, state that the Arabs stripped them of their clothes.

The Arabs would have killed them, they add, but for the intervention of British aeroplanes from Aden. The captain and crew speak with great gratitude of the British authorities.

The R.A.F. Quarterly.

An Air Ministry Order announces that Gale and Polden Ltd. will publish, in January, 1930, the first number of a periodical entitled *The R.A.F. Quarterly*. It will be devoted to the interests of the R.A.F. and will include articles on all Service subjects.

Officers and airmen are invited to submit articles for publication in this journal. Gale and Polden Ltd. will be responsible for obtaining Air Ministry approval for their publication. All articles accepted for publication will be paid for.

A committee of R.A.F. Officers will be formed who will act with the Editor in a purely advisory capacity.

Prizes for essays will be offered by the publishers of the *R.A.F. Quarterly*.

All inquiries should be addressed to the Editor, *The R.A.F. Quarterly*, Gale and Polden Ltd., Wellington Works, Aldershot.

The Fleet Air Arm.

Portsmouth Navy Week gave the public a welcome and unusual opportunity of having a look at two of the aircraft-carriers of the Royal Navy. The two at Portsmouth were H.M.S. *Furious* and H.M.S. *Argus*. Although the *Furious* is by far the more interesting of the two there were not the same facilities given for viewing the ship. In fact the chief advertised attraction was tea in one of the hangars enlivened by a first class band of the Royal Marines. Apart from a general idea of the size of the flying deck and the enormous accommodation in the six hangars, all of which were empty, there was very little to be seen.

H.M.S. *Furious* has a normal displacement of about 19,100 tons and carries a complement of 748. Her total length is 786¼ feet and beam 89¾ feet. Her armament is ten 5.5 in., six 4 in. A.A., four 3 pounders, four M.G., and ten Lewis guns.

The R.A.F. Units carried are No. 405 (Fleet Fighter) Flight (Flycatchers): No. 443 (Fleet Spotter Reconnaissance) Flight (Fairey IIIF): No. 447 (Fleet Spotter Reconnaissance) Flight (Bison): No. 449 (Fleet Spotter Reconnaissance) Flight (Blackburn): No. 461 (Fleet Torpedo Bomber) Flight, (Dart).

The Senior R.A.F. Officer is Grp. Capt. F. E. T. Hewlett, D.S.O., O.B.E.

The accompanying illustrations were taken on board H.M.S. *Furious* during recent exercises of the Mediterranean and Atlantic Fleets.

H.M.S. *Argus* was so well laid out for inspection that she was uncomfortably crowded during the whole week. Routes were mapped out for the visitors and the directions indi-

ACTION STATIONS.—Fairey Flycatchers and Blackburn Darts ready to take off the flying deck of H.M.S. "Furious" during the Fleet Exercises in the Mediterranean.

THE "Bristol" BULLDOG

The "Bristol" Bulldog stands out among the single seater fighters of the present day as an example of modern steel aircraft construction unequalled in design and workmanship. The performance of the machine is exceptional and its manœvrability must be seen to be appreciated.

Simplicity is the keynote of the design and although a full military equipment is carried the arrangement and accessibility of all items are matters that have received very careful attention. "Bristol" aircraft have earned a reputation for general excellence that has been enhanced by the advent of the Bulldog single seater day and night fighter.

WELL AWAY.—A Fairey Flycatcher (Jaguar engine) of No. 405 (Fleet Fighter) Flight leaving the deck of H.M.S. "Furious." The steam jet and white guiding line can be seen on the deck and on the right is the signalling arm of the Officer in Charge.

cated by arrows of different colours. Thus the hardy and enduring could follow the red arrows on a tour of indescribable stuffiness and discomfort while the weaker brethren followed the blue arrows on a short stroll through the hangars and along the flying deck.

Other notices begged visitors to ask questions as much as they liked and others described the various exhibits which included specimens of the Naval and Air Force uniforms and rank badges, etc. One exhibit was a specimen of the day's rations of a seaman, to which uninteresting diet sympathetic feminine visitors were adding chocolates.

In the hangar was a Blackburn Blackburn, folded, and a Fairey Flycatcher. There was also an obsolete fuselage of a Fairey IIID which is used as an engine test bench.

An electrically-driven lift takes the machines up to the flying deck, the Blackburns folded and the Flycatchers spread. On reaching the flying deck the machines are wheeled to the stern of the vessel where they are chocked fore-and-aft and held down by machine-crews. This part of the deck accommodates nine Blackburns and three Flycatchers and still leaves room for taking off.

In ordinary weather, with the ship steaming into the wind the Blackburns take off in 20 yards and the Flycatchers in 10.

The flying deck slopes slightly fore-and-aft. The wireless masts and other deck structures fold outwards for flying. The total length of the flying deck is 560 feet.

The ship steams head into wind for flying. The machines take off when the correct angle is indicated by a steam-jet in the bows which has to be blowing straight along a white line painted on the deck. They dive slightly on leaving the deck to gain speed to rise on the turn outward. Each aeroplane has its own flag and a machine may not alight again on the deck unless its own flag is flying. The steam-jet and the Wing Commander's signalling arm can be see in one of the photographs.

When the machines are ready to land again the crew stand round the sides of the deck, and hang onto the win and tail immediately the machine touches the deck. Fo men are allotted to each machine.

In addition to the hangars, H.M.S. *Argus* has a machin shop for repairing engines and carries six spare Lions a two spare Jupiters. Another workshop is used for repai ing other parts of the machines, doping, etc.

H.M.S. *Argus* is a converted liner with a normal displac ment of 14,450 tons and carries a complement of 373. H total length is 560 feet and her beam 68 feet excludi bulges. Her armament is six 4 in. A.A.; four 3 pounde four M.G., and ten Lewis guns. The hangar is 350 fe long by 68 ft. wide and is divided into four sections by fi proof screens. The two electrically-controlled lifts are ft. by 36 ft. and 60 ft. by 18 ft.

The aircraft have "dog-leash" grabs on the undercarria which grip the safety net on landing and check spe There are two derricks with electric winches amidships the flying deck and two electric cranes at the stern on t hangar deck level to pick up aircraft out of the water.

The R.A.F. Units carried are No. 401 (Fleet Fighte Flight (Flycatchers): No. 441 (Fleet Spotter Reconna sance) Flight (Fairey IIIDs): and No. 450 (Fleet Spot Reconnaissance) Flight (Blackburn Blackburns). T senior R.A.F. Officer is Wing Cdr. J. H. S. Tyssen, M.C.

The other Aircraft-Carriers are H.M.S. *Courageous* w six Flights under Wing Cdr. R. Collishaw, D.S.O., O.B D.S.C., D.F.C.; H.M.S. *Eagle* with three Flights under W Cdr. R. M. Field, H.M.S. *Hermes* with two Flights under W Cdr. A. H. S. Steele-Perkins, O.B.E.; and H.M.S. *Vindict* with one Flight.—C. M. MCA.

FLEET RECONNAISSANCE.—A Blackburn Blackburn (Napier Lion engine) of the Fleet Air Arm, R.A.F., being spread for flight on the flying deck of H.M.S. "Furious." These machines are used for Fleet Spotter Reconnaissance.

A Country Club for everyone interested in flying.

HANWORTH

The London Air Park, will be formally opened on Saturday next, 31st August, by Her Grace the Duchess of Bedford.

THE occasion marks the first stage towards the realisation of a country-wide scheme of facilities for the private owner and the club flyer.

Hanworth is the most modern and the best-equipped private flying centre in the country. The amenities of the Club include a ball-room, lounges, drawing and writing rooms, dressing rooms, and first-class residential accommodation, besides the provision of tennis and squash rackets courts, and an excellent standard of catering. Wooded gardens and lawns surround the club-house, and the whole estate covers an area of 230 acres, including the two aerodromes of the London Air Park.

The most modern machines of various types are available for instructional and touring flights. Special provision is made for the housing and servicing of privately owned machines.

Hanworth is the ideal flying centre, and is only 30 minutes by road from Hyde Park Corner.

A limited number of members are being enrolled, to enjoy all the privileges and benefits of the N.F.S. organisation, at the following rates: Flying Members, 5 gns. entrance fee, and 5 gns. annual subscription; Non-flying Members, 3 gns. in each case. For this year two-thirds of the annual subscription is rebated. Serving Officers of H.M. Regular Forces are admitted without entrance fee. Membership of the Hanworth Club confers Honorary Membership of all other N.F.S. Clubs, and free use of every N.F.S. station.

Qualified flying members will be able to hire two-seater light aeroplanes at rates as low as £1 1 0 an hour (3½d. a mile) from any N.F.S. club. Residential terms at Hanworth range from 5½ gns. to 7 gns. per week.

An illustrated brochure, detailing the services offered to all who wish to fly, will be sent on request.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

A NEW BARREL ENGINE.

For many years much interest has been taken in the possibilities of that type of aero-engine known variously as the swash-plate type or the wobble-plate type or the barrel type.

Some of these have been designed so that the barrel revolves. In this group are the Almen barrel engine which flew many years ago in America, and the Statax engine which was produced before the War and has flown recently in Switzerland, according to the claims made by those who are now interested in it. The objections which apply to rotary radial engines apply also to the rotary barrel engines with the additional objection that centrifugal force throws the pistons out against the cylinder walls and puts strange strains on the connecting-rods.

Among stationary barrel, or swash-plate, engines there is the Redrup engine which was shown at Olympia, and has quite definitely flown in a Spartan light aeroplane. Though nothing has been published about it there has been for several years much talk in the Aircraft Industry about a swash-plate engine with which Rolls-Royce Ltd. have been experimenting. And experiments with a number of other engines on these lines have undoubtedly been tried in the past fifteen years or so.

For engines of low power, as used in light aeroplanes, the advantages of the barrel-type engine are not so obvious as they are for the bigger types. In the 100 h.p. class an inverted Cirrus or Gipsy would probably fit into the nose of an aeroplane just as well as would a barrel engine of the same power,—simply because the barrel engine would be so much smaller than the frontal area of the fuselage itself. But if a barrel engine can be made to work as efficiently and as reliably as engines of other types, and if it can be produced as cheaply and at no more weight per h.p., then undoubtedly a 200 h.p. engine could be made which would fit quite comfortably into the fuselage of any standard type light aeroplane.
